Can not we do something similar to this in our home economics exhibits? I believe we can. First of all, we wish to establish definite standards or score cards. These will not only set more definitely a standard for the article to be made, but will serve to emphasize the characteristics which are most important in that article, and by the comparative ideal score will show the relative importance of these different characteristics. Then if to each entry could be pinned a score card showing rank and why and where it has failed, each would know in what way her entry might be bettered another year. Then a step further—let us always have in connection with these exhibits talks telling the "whys and hows," discussions into which all may enter. This done, would not these women go home stimulated with the desire to make better things all the year. It would cease to be luck, but would be very much more a question of definite application of knowledge. Definite ingredients, combined in a definite way, must give definite results.

This would possibly mean a cutting down in the number of articles exhibited—but why have the same cake with three differet kinds of icing, why the same pie crust with several different fillings? Are not our exhibits tending to elaboration rather than the simplification which modern life demands?

These same points hold true with the sewing. We have an equally good opportunity here for the development of standards—our American ideals of everyday sewing are very poor. Let us still do all we can to encourage beautiful handiwork, but is it not still more important to encourage beautiful machine work, and to raise the standards of our women. The usual bargain counters of overtrimmed underwear in our department stores exemplify better than anything else I know the usual standard. Is not the raising of these standards quite as important as encouragement along lines of handiwork? Handwork which, in many cases, has no other function than wearing out the eyes and nerves of sensitive women, and using much time which should be spent out of doors. Let us still encourage sewing, both by hand and with the machine, but most of all let us use these exhibits to raise the standards of our women, and give them a sense of the really beautiful, and an appreciation of proper relation between health and handwork.

We cannot do all this at once, but let us try next year, in every home economics exhibit over the state, at least, to make a beginning. Let us select those entries which are really worth while. Copies of score cards for some of these may be had by application to the department of home economics, University of Missouri, and the State Board of Agriculture is always glad to send out judges to the county fairs. Then let the women get together for discussions and exchange of ideas. One woman makes delicious bread; let her pass the secret on to her neighbors. Do not just exchange the recipes, but discuss the reasons why. In this way I think we can obtain much that is good from our home economics exhibits.—Louise Stanley, Department of Home Economics, University of Missouri.

THE RETIRING FARMER

There is a lot of discussion going on now about the best way and place for the farmer and his wife to spend their last years. We think it is largely an individual matter for we see on the one hand so many old people enjoying life on the old farm their hard work has made comfortable, and again about an equal number who are enjoying the new-made home in town that we are convinced that no one fast rule will fit all cases. More important we think, than the "place" is the "way" in which our old age is spent. No matter where the father and mother spend their declining years, we think it is better to spend them actively than passively, and hence we don't like the word retired for those who must of necessity cease so much hard manual labor. That old age which is spent in usefulness of some kind for making the world better never needs to retire although the hands may cease hard labor.

Here is a presentation of this subject which sets forth very clearly one side of this subject from a woman who has already seen many years of the strenuous side of farm life. "I fail to see where any great credit is reflected upon the man or woman who was born, reared, married, raised a family, died and was buried on the same little patch of ground called an eighty-acre farm, without ever having ridden on a railroad, talked over a telephone and never having been away from the spot for a few days in seventy or eighty years," writes Mrs. Geo. Myers in the Iowa Homestead. "To me it lacks the spirit of progressiveness that has made our country what it is, and shows the 'This is good enough for me, let the world move on' spirit.

"I fail to see why a man and woman who have worked hard for forty or fifty years must still remain where the work lasts every day from 'sun till sun.' When people who have been used to working get to the place where they are not able to work as they once did, it tires and worries them to sit down and watch other people work. The only way for a tired person to rest is to get away from the work he has been doing for years. When a farmer is not able to work hard and must hire help it adds to the work for his wife, who is also past hard work. A man gets to the place where he is not able to stand the strain of 'bossing the job' and keeping incompetent hired help.

"Let your son and his family move into the home and take the responsibility. Very well, then we have the old story of the big house which is too small for two families. John doesn't farm just like his father used to and the poor old man thinks the place will go to ruin. John's wife is a good woman, but she can't save like John's mother does, and the poor mother soon thinks she ought to take a hand in things. Only trouble for both women will follow. Then two or three children come. The babies are nice, but the noise those boys do make! O, the blissful, happy days that follow for worn-out father and mother on the farm! How satisfied and contented John and his wife are!

"Suppose father and mother had said, 'We are not able to manage the work on the farm, so we will let John move here and we will buy a cozy little home at the edge of the town where we have done our trading for a long time and feel acquainted. We

Crown Combinola

"The Player of Many Tones"

NOT to be confused with ordinary player-pianos. It is built to satisfy the demand for a player of the highest type in a piano of the highest grade. All player music can be played upon it easily, conveniently, and with expression. The striking fingers are flexible, giving a delicate, human-finger touch.

But it is more than a player-piano of the highest type, for, *in addition to all piano music*, it enables the pianist to reproduce at will, either by hand or by means of the player roll, the tones of the harp, auto-harp, chimes, xylophone, guitar, banjo, piccolo—all these and others by means of famous "Multitone Adjustment" *which is found only in our instruments.*

And please do not get the erroneous impression that the "Multitone Adjustment" is a so-called mandolin attachment, *for it certainly is not.* A pure string tone is secured just as in plucking a stringed instrument. The thud of the hammer is absent.

Your old piano taken in exchange at a liberal allowance. Estimates furnished FREE upon request and with no obligation on your part.

Our booklet "Music in the Home" explains in detail and is an interesting treatise for all music loving folks.

can keep a cow, a few chickens and our faithful old horse, and with a garden patch we shall have all the work we are able to do. In this case John and his wife are young and happy on the farm, doing the work according to their own ideas. Father and mother are happy and contented to be away from all the hard work and yet have all the work they feel able to do.

"The farm is a very good place for people to live who are well and strong and able and willing to work. But if some of these town people who know so well what the farmer ought to do would follow in his tracks for a few months they might know less. How much time does the farmer's wife have to don a white dress and sit on the front porch with her fancy work? Country cream and butter, fresh eggs and friend chicken, with fruit and vegetables from the garden are delicious eating, but it takes work, hard work and lots of it, to get them.

"If the farmer and his wife would do all the things that the farm papers and city people tell them to do in managing their farm it would take all they could make to pay the hired help to do the work. Not but that it would be very nice to have everything done so—but who can do it? We country women like to have our homes nice and in order, besides trying to make butter and raise chickens to pay the grocery bills, to say nothing of caring for the garden. Someone will say, 'O, let the men do that.' The men generally have more than they can get done as it should be done.

"The farm is not the place for the tired, worn-out farmer and his wife. And if they are financially able to live without working let them, by all means, leave the large farm and enjoy their declining years in town or on a few acres at the edge of town. To this I would add: leave the farm before you and your faithful wife are too worn out to enjoy yourselves anywhere."

POULTRY TROUBLES DURING THE FALL SEASON

The success of the flock during the winter season depends greatly upon how the birds pass through the fall season, which usually finds the flock composed of birds of all ages and all conditions and stages of moult.

The roosting quarters are found scattered all over the place, some roosting on fences, some in the poultry house, some in trees, and some in hovers or jammed into the corner of a house till they are two or three deep during cool nights. The ones roosting in houses and on the floor in the corner or some house are the ones which need attention.

One of the most common troubles noticed in the fall and early winter is colds and roup. A cold is usually the first stage or stepping stone to roup so that if colds are prevented, roup will be avoided. The two common causes for colds are an unequal heating of the body and the rapid reduction of the temperature. Roosting in a draft will cause a cold according to the first cause, and crowding will cause it by the second.

If a man's temperature gets too high from exercise or extra clothing, nature sends out a perspiration or sweat onto the surface and by evaporation the heat units are taken up and the body is cooled. A hen's temperature is not reduced in this way, for she has no sweat glands in the skin. The moisture with the hen is carried out through the breath so for this reason, if a hen is very warm she will have per mouth open forcing the air in and out to take out the moisture and not to get an extra supply of oxygen into her lungs. If the chickens are crowded at night they are very warm then come out into a cold frosty morning, the breathing organs are so chilled that a cold is the result, which paves the way for roup.

Many cases of roup attributed to the winter season had their real origin in the fall season. A hen's temperature is 106½. She is covered with a coat of feathers for protection. Therefore, hens should not be expected to live under conditions which are comfortable for man. More birds are injured by housing too closely and crowding than by the opposite.

While we do not believe in a "balm for all ills," yet we find the following a good preventive and treatment for roup, canker, chicken pox, etc.:

Magnesium Sulphate	10 oz.
Magneisum Oxide	1 oz.
Sulphate of Iron	2 oz.
Ground Ginger	2 oz.
Sulphur	3 oz.

Give one tablespoonful in moist mash to 12 birds each morning for three mornings and discontinue till needed.

The Magnesium Sulphate acts on the intestines; the Magnesium Oxide on the kidneys; Sulphate of Iron acts on the blood; the ground ginger stimulates all organs, and the sulphur is a general antiseptic. This is therefore a good system treatment or tonic for the fowls.

For severe cases the dose mentioned above should be increased.

No one, however, should ever try to control a disease without first removing the cause. If your birds have a cold, first remove the cause, then administer treatment.

During the fall season all grains, weed seeds, etc., ripen, so that if the birds have free range, they have an abundant supply of food, but the ration is often unbalanced for the ration usually contains too much fat producing elements with not eough tissue forming elements. If the birds have range on clover, alfalfa, cowpeas, etc., the ration is more apt to be balanced, but if they range in a corn field, the hens shold be fed protein in some other form, for without it, the hens will get very fat but produce no eggs.

WHITE RUNNER DUCKS AS I KNOW AND BREED THEM

This rare and lovely variety of pure bred Runners is separate and distinct from the common duck family.

The White Runners have been raised in America only a few years, the first Indian Runners having been imported from England twelve or fifteen years ago. Runners were introduced into England some 80 years ago from India. They were called Indian because of coming from India and Runner because, when frightened, they have a peculiar way of standing nearly erect and running unlike any other duck. They have upright, finely moulded bodies, thin, slender necks, surmounted by keen, finely chiseled heads and are of pure white plumage. Their superiority of type, style and action put them in a class by themselves and always on top.

I remember of reading soon after the White Runners were first brought to this country, that they were the leghorns of the duck family, and that more money was to be made with them than with any other kind of poultry. But at that time, prices were so high that I waited awhile before investing.

When I did make up my mind to give them a trial, I received my start from a breeder, one of the most successful in the country, who had taken more than one "blue" at the big shows, and who was breeding for eggs as well as the show room. I have never had cause to regret my investment.

These ducks have many merits and few faults. They are the most prolific layers, laying in the winter time when eggs are high. The eggs are much larger than a hen egg and are pure white. Please do not overlook what I say about its whiteness for I have never found a tinted egg. Eggs have been known to bring from 10 to 15 cents more than hen eggs at the same time of the year in New York City.

I might add that on account of the fact that some other kinds of Runners lay a greenish colored egg, this tends to decrease the sale of Runner eggs. The eggs are perfect in flavor and quality, free from any coarseness and highly appreciated by the most fastidious palates. As table birds, they are plump, fine flavor of flesh but do not attain great weight.

I have never had an old duck show signs of sickness and have never lost one by death, and can say almost the same for my young ones.

If you follow a few simple rules you will have no trouble. Never let them stay out in a rain, for they will stand with mouths open until they drown and it takes only a few minutes, at most, for this to happen, when they are but a few weeks old. Use good judgment in feeding and don't forget to give them all the water they want to drink. Finally, keep their quarters clean for they respond quickly to good treatment.

Acid Stomach Claims Millions Of Hogs!

An enormous percentage of all hog losses is due to stomach disturbances and stomach disturbances are largely due to acidity, which interferes with the digestive juices and thereby impairs digestion. Result—thin, scrawny hogs that seem half-starved no matter how much they eat. Millions die. Thousands of hog raisers have proved that the safe and reliable way of neutralizing this acid and preventing its forming again is to mix just a little

MERRY WAR LYE

in swill, or with the drinking water, if the hogs are on dry rations. It not only neutralizes the acid but also sweetens the swill, thereby preventing the fermentation that causes the acidity. Moreover, it adds weight to hogs because it helps thorough digestion, leaving no waste food. Hogs come right up, under this simple treatment which produces amazing results.

There's as much difference in Lyes as there is in Doctors, so don't count any trial made with any other than Merry War Powdered Lye. The experience of thousands of hog raisers has proved the value of Merry War Lye. Its use is *not* an experiment.

Send for free booklet filled with letters from hog raisers. They will convince you. But a better way to be convinced is to give it a trial on your own hogs. The cost is practically nothing. It is absolutely safe to feed to hogs according to plain, easy-to-follow directions on label.

Keeps Poultry Healthy Merry War Powdered Lye mixed with feed or water according to directions on label, helps to make poultry sturdy and better able to resist White Diarrhoea, Diarrhoea from Indigestion, Cholera, Roup, Limberneck, Gapes, Worms, etc.

Ownership of The Missouri Farmer

In accordance with the law enacted by Congress which requires newspapers and magazines to file a statement showing the name of the editor, business manager, the owners of the publication and the names of any bondholders, mortgagees and other security holders, The Missouri Farmer has filed the following statement with the Postoffice Department: The managing editor is Geo. B. Ellis. The business manager is William Hirth. The Hirth Publishing Company, which owns The Missouri Farmer, is incorporated for $20,000 divided into 200 shares, 189 of which are owned by William Hirth and 10 shares by Lillian Hirth.

We would like to have our farm women readers write us their experiences with raising chickens, turkeys, ducks and other fowls. Give us an account of the profits you have made on poultry. These articles will make useful and interesting reading for our poultry raisers.

Our booklet on the control of Hog Cholera contains two chapters on Hog Breeding and Feeding which render it invaluable to every farmer. If you will send us a dollar for three years' renewal to the paper we will send it to you free.

Market Topping Durocs

We are in receipt of a very interesting letter from W. O. Smith, senior member of the firm of W. O. & B. A. Smith, Thompson, Mo., in which they have the following to say:

"We are today in receipt of a letter telling us that the highest priced load of hogs sold on either of the five leading markets this year, was sired by a boar we bred and raised. Furthermore, this was the only load of heavy hogs to top the market so far this year. Naturally, we take considerable pride in this record. We have a few good boars on hand now that are bred practically the same as the above boar, and they are just as good at the same age.

We want you to see our new boar, and believe that you will pronounce him a popper. He is by Pal's Col. and is out of a Fancy Col. dam; second dam a grand daughter of Proud Advance. Mr. R. C. Watt, who bred him, said, 'There will not be a bigger or smoother yearling sold this year and he is ready to go into the best shows and win his share of the ribbons. He has demonstrated his ability as a sire.' Col. Igleheart said of him: 'I think he is a great boar. In fact, I think he is as good as Pal's Premier or Pal's Success. The Premier boar sold for $860 and Pal's Success sold for $1500 I am sure he would be in the money in any show ring.' We have a great line of gilts by Beauty's Model, Col. Bob, S. & C's Valley Chief, and Instructor, that we are breeding to the above boar, and we are prepared to book orders for these gilts to be shipped when safe in pig. We really believe that this new boar is the largest, smoothest, longest, heaviest boned, big type boar of his age in the West."

The Smith herd has long been recognized as one of the progressive herds in the state and from the above letter our readers can gain an idea as to the quality of the Durocs now offered for sale. Get in touch with this firm at once. Please mention this paper.

Porter's Polands

Notice the change in the advertisement of M. D. Porter, the veteran breeder from Vandalia, Mo. Mr. Porter is now offering several richly bred spring boars at prices that should move them in a hurry.

Mr. Porter is one of the oldest Poland China breeders in this state and for years has been among the successful exhibitors at the Missouri State Fair. This last year Mr. Porter not only made a fine showing in the futurity but he had the grand champion sow. When you buy from this herd you buy on a guarantee of satisfaction. Mention The Missouri Farmer.

Shropshire Specials

Look up the advertisement of C. W. Chandler, Kellerton, Ia., who advertises Shropshire sheep in this paper. Mr. Chandler is offering some good values in ewes and rams.

Angus Cows and Heifers

J. D. Blackwell of Fayette, Mo., is offering a few good registered Aberdeen-Angus cows due to calf in early spring, also yearling heifers and bulls, fancy bred and in good thrifty condition at attractive prices, if taken in the next few weeks. Mr. Blackwell will be glad to correspond with any prospective purchaser and will be glad to give detailed information concerning these cattle.

Megown's Spotted Polands

Judge B. B. Megown, New London, Mo., advertises a choice lot of early spring spotted Poland Ccina boars. Judge Megown is one of the most ardent supporters of the spotted Poland to be found anywhere, and his herd has been built up on the best blood and individuality he could buy. At present a few cracking good boars, sired by Silver King, by the great Spotted King, are being priced in keeping with the quality offered. The writer regards Silver King as one of the most valuable spotted boars owned in Missouri.

Clydesdale Horses, Jacks and Jennets

Clydesdale Stallions, Mares and Colts, with quality and breeding, for sale at lowest prices. We also breed Jacks and Jennets and sell them as low as the lowest.

Col. Wonder Duroc Boars $25

At recent Missouri State Fair my herd won 35 ribbons—3 championships, 15 firsts. Col. Wonder sires my champions—he will sire them for you. Choice bred gilts. Spring boars by Col. Wonder $25 each. Send check in first letter. Nothing but the best sent on mail orders.

CHAS. L. TAYLOR - - - - - - Olean, Mo.

Lockridge's Champion Polands

Several years ago Will G. Lockridge, of Fayette, Mo., said to the writer: "I feel rather well pleased with the herd at present—it has paid its way and made a little money, and whenever it fails to register a profit I will quit—but I am not satisfied and will not be, until I have the best. I have used some mighty good boars, but I want better."

In a nutshell that is the plan Mr. Lockridge has pursued in building up his herd. He started with small capital and his herd has made its way, he was never satisfied with what he had, and was always on the lookout for a chance to improve.

A year ago last winter he attended the McClarnon sale and purchased a Colossal sow bred to Hercules, the boar that attracted so much attention about that time. In the litter farrowed by this sow was a boar pig that just seemed to grow away from the rest. We remember the pig quite well and remarked on his unusual size. Later in the fall we saw this same pig and could hardly believe he was the same. By this time Mr. Lockridge was convinced that he had the making of a great herd boar and he began to watch the boar. When he began breeding sows for his February sale, he bred a number of his best ones to the young boar. The day of the sale, The Giant was a regular sensation and gilts bred to him were in sufficient demand to average $57. The Giant continued to develope, and his owner decided to take him to the State Fair and let the public see him. He was shown and won first in his class and was later made grand champion. It was conceded by all that The Giant was the largest junior yearling seen at Sedalia in years. A giant in size, this boar shows remarkable smoothness and quality. His back is exceptional and it would be hard to find a boar as good on his feet. The spring boars that Mr. Lockridge is offering are mostly by this grand champion and show the same qualities, to a degree, that made the sire a champion. The prices are very reasonable, and when one stops to think of the added value of having a boar sired by a grand champion they look positively cheap. Only a few are left but they are good. Mention this paper.

The College of Agriculture

Offers Live Stock for Sale

Otterville Missouri

MOLASSES Richest Feed Lowest Cost
St. Louis Molasses Co., Dept. MF., 400 S. Broadway, St. Louis.

Baker & Son's Undefeated Boar

W. A. Baker & Son, Butler, Mo., who advertise Poland Chinas in this paper, are prepared to offer some real bargains in spring boars sired by Big Bone's Son Jr., their undefeated boar. Messrs. Baker purchased this boar a year ago after he had won at most of the Mid-West fairs. He was shown again this year and returned home undefeated as a senior yearling. Big Bone's Son Jr. is by the celebrated Big Bone's Son. His dam was Anna Price 11th by Pawnee Lad. Other boars by Big Look and Missouri Wonder are also in offer, and buyers will be pleased with the general quality of the get of either of the three boars. Messrs. Baker are real hog men and their herd is among the best in the state. Mention this paper.

Frost's O. I. C's

In sending in a change of copy for their advertisement S. D. & B. H. Frost, Kingston, Mo., say that the fall pigs they are now offering for sale make up just about the most desirable lot they have ever raised. They have a bit more size and stretch than last year's crop, and show as much quality. The Frost herd has been before the buying public for over thirty years and today it occupies a place secure in O. I. C. circles. Our readers who are in the market for O. I. C's should take advantage of the opportunity to buy a trio of unrelated pigs. Prize winning blood predominates in the Spring Grove herd. Mention this paper.

McPherson Has Durocs With Size

J. E. McPherson, Columbia, Mo., is advertising a very attractive lot of Duroc spring boars and gilts. Mr. McPherson has been engaged in breeding Durocs for a number of years, but it was not until this season that he felt that he was ready to offer his stock to the buying public. We doubt if more size can be found than is shown in the February and March boars for sale. Most of them are sired by the good boar, Golden Tat, by Tatarrax Again. Tatarrax Again is the boar that has given such a good account of himself in the herd maintained by the College of Agriculture. The dams of the offering are, very largely, sows rich in the blood of Ohio Chief. Get his prices before buying.

Fish Offers Berkshires

J. V. Fish, Bolivar, Mo., is advertising some attractive buys in Berkshire breeding stock of various ages. Mr. Fish writes that he can furnish either boars or gilts sired by the grand champion boars of Illinois and Missouri. Mr. Fish also offers S. C. Black Minorca poultry.

Smooth Columbus Boars

Spring boars sired by Smooth Columbus, the boar that has attracted so much attention in the Belcher herd, are offered our readers at very reasonable prices. It will be recalled that Bennett Brothers recently purchased a half interest in this boar for $750. Among the boars now offered are two very attractive spring pigs. One is by Smooth Columbus and the other is an extremely large youngster sired by the noted Big Joe and out of the great sow Fessey's Lady. Either of these boars are likely herd boar material and are being priced so that the man with a few good sows can afford to buy. Bennett Brothers are preparing for a bred sow sale and are therefore anxious to dispose of these boars. Everything offered is immune and sold on a guarantee. Please mention this paper.

Durocs Bred Deep in the Blood of Champions---

It costs no more to buy Durocs sired by proven champions. Spring boars and gilts sired by Col. Wonder, Instructor, and other boars. Plenty of size and stretch. Pairs or more of unrelated stock. Price $25.00 each.

Rockwood Farm - - - - - Iberia, Mo.

Durocs With Size and Bone

I am offering a choice lot of early spring pigs with unusual size, bone and quality. Bred right and priced right. Visitors welcome.
A. C. BROCKMAN, R. F. D. 2, Centralia, Mo.

Duroc Boars For Sale

Anything from a 50-lb. weanling to a 500-lb. herd and show boar. We offer some first-class herd header prospects. Good strong boned farmers stock boars. Also gilts. I also have one 16-months and one weanling Shorthorn bulls. Write me your wants. Will try to please you—the price will be right. Over forty old customers are buying here because both prices and stock have been right. Write today for that boar. I have got him. J. E. WELLER, FAUCETT, MO.

A. NO. 1 DUROC SPRING BOARS

I am offering a few extra choice spring boars sired by ILLUSTRATOR and out of TATTLETALE 39th, junior champion International 1913. A few by CRIMSON CHIEF AGAIN. Write or come.
W. C. WATSON. - - - - - - - NEW LONDON, MO.

SMITH'S DUROC BOARS

The good yearling BEAUTY'S MODEL AGAIN, an extra good breeder and a number of spring boars. Some fine gilts mated to PAL'S FANCY ADVANCER for spring farrow. W. O. & B. A. SMITH, Thompson, Mo.

A Splendid Chance to Buy a Shorthorn Herd Bull

Elsewhere in this paper will be noticed the advertisement of J. F. Richards & Son, Bevier, Mo., in which they offer for sale their herd bull Lord Collynie 388445. This bull was bred by S. C. Hanna, and was sired by the great old bull Collynie 135022, and out of the cow, Emma Cowslip; second dam Imp. Emma 33rd. Lord Collynie is not only a royally bred bull, but he is an individual of exceptional merit. He is a roan bull of plenty of scale, lots of character about the head, carries as good top and underline as one could ask, and is naturally a very thick fleshed bull. Lord Collynie has given a good account of himself in the Pen-Yr-Hyl herd, as is evidenced by the class of heifers that are being kept. Ordinarily a breeder would not sell a bull of this caliber, but because of the fact that Messrs. Richards maintain a small herd they find it not practical to retain him. This bull must be seen to be appreciated and we urge any of our readers who may be interested to communicate with Messrs. Richards at once.

Brockman's Duroc Spring Boars

A. C. Brockman, Centralia, Mo., is offering a very desirable lot of Duroc spring boars and gilts that are bred along the same lines as the spring stuff he exhibited at the State Fair. Mr. Brockman keeps his herd up to a very high standard and it is no idle statement to say that he has one of the most valuable collections of brood sows in Missouri.

Raucher's Chester Whites

As usual the well known firm of H. Raucher & Son, Kahoka, Mo., is offering the trade a valuable lot of spring boars and gilts. For thirty years this herd has been counted among the really good collections of the breed and the fact that it is stronger today than ever is proof of the progressiveness of the firm. Get their prices before buying.

Hereford Bull for Sale

Hugh Whiteford, Guilford, Mo., is offering a cracking good two-year-old bull for sale at a bargain. This bull is right in every way and is bound to please a critical buyer. He has plenty of scale, and is the wide, deep thick-fleshed kind that will add quality and dollars to any herd. Write Mr. Whiteford for his price. You will be surprised how reasonable you can buy this bull.

REXALL COL. FOR SALE

To close an existing partnership between myself and the College of Agriculture we are offering the above boar for sale. Here is an exceptional chance to secure a high class boar for a reasonable price. I also have a number of choice gilts bred for early spring farrow.
R. L. HILL - - Columbia, Mo.

Hazelwood Durocs

Seventy choice spring boars and gilts sired by HAZELWOOD CHIEF, by CRIMSON COL., and out of OHIO CHIEF bred sows. Get our prices.
E. P. POWELL & SON, Maryville, Mo.

150 Duroc Boars and Gilts

February, March and April boars and gilts sired by Golden Tat, Bob's Col. Wonder, Col. Wonder and Professor's Col. Stretch, size, bone and quality. Priced for quick sale. Write or come.
J. E. McPherson, Columbia, Mo.

75 Duroc Spring Boars and Gilts

Seventy-five (75) good boars and gilts. Rich breeding, and plenty of size and bone. Pairs, trios or more. Priced to sell.
J. C. Garrard & Son, McBaine, Mo.

DUROC BOARS

Good Duroc boars from the best of breeding. They will give satisfaction. Will sell cheap. Large enough for service.
JOHN P. LANEY, WINDSOR, MO.

Duroc Hogs for Sale

THE BLOOD OF CHAMPIONS
Am offering my entire herd, 2 herd boars, 10 herd sows, young boars, bred gilts, a few yearling gilts, 50 fall pigs. Not related. Write me if you want the best.
BUCKEYE STOCK FARM, OLEAN, MO.

HEREFORD CATTLE

HEREFORD BULL

For sale, a registered Hereford bull, two years old. A good individual and priced right for a quick sale.
Hugh Whiteford - - Guilford, Mo.

SHORTHORN CATTLE

Shorthorn Bulls and Heifers

PEABODY FARM now offers 12 choice young bulls and 20 heifers. Good individuals; reds and roans. Priced to sell. Also 20 open BERKSHIRE gilts. Get our prices.
June K. King & Son Marshall, Mo.

SPLENDID SHORTHORN HERD BULL

LORD COLLYNIE 348445, a proven sire of merit and a splendid individual. Sired by Collynie and out of the great cow Emma Cowslip. Write for price.
J. F. Richards & Son, - Bevier, Mo.

Your Hogs

Rid Them of Worms—Like This

For every two hogs put one tablespoonful of Dr. Hess Stock Tonic in the swill twice a day and I guarantee it will get the worms.

Worms are responsible for nine-tenths of all your hog troubles at all seasons of the year, but especially in the fall.

Now, don't be misled thinking your hogs have some other ailment. Nine times out of ten it is worms. My Stock Tonic will positively expel these worms—it will keep your hogs in a healthy condition, thereby enabling them to resist disease and lay on fat. Feed my Stock Tonic to your hogs right now to expel the worms. Feed it also to your horses, cattle and sheep during the winter months, when they are on dry feed; it is a splendid conditioner and tonic and an aid to digestion.

Dr. Hess Stock Tonic

25-lb. pail, $1.60; 100-lb. sack, $5.00. Why pay the peddler twice my price?

My Stock Tonic will keep your stock in prime condition, vigorous and healthy, aiding digestion and assimilation. It has been tested by farmers all over this country for 24 years; it has been sold under my famous guarantee for all that time; that guarantee has been backed up by over 27,000 dealers, one of whom lives right in your town—not a peddler, mark you, but a reliable storekeeper whom you know.

My Stock Tonic is highly concentrated, as the small dose quantity will prove; and as I have no peddlers, wagons and horses to pay for I am able to sell my Stock Tonic through a reliable dealer in your town at rock-bottom prices.

It will put your horses, cows and sheep in fettle, and if your hogs are wormy, put one tablespoonful in the swill twice a day for every two hogs, and I want to tell you that it will be good-bye to the worms or my tonic won't cost one cent. And here are my prices—just half what the peddler charges: 25-lb. pail, $1.60; 100-lb. sack, $5.00. Smaller packages as low as 50c (except in Canada and the far West and the South).

Dr. Hess Dip and Disinfectant

One Gallon Makes 70 to 100 Gallons Solution

One gallon can, $1.00; smaller packages as low as 25c.

Except in the far West and Canada

A powerful disinfectant and germ destroyer. I urge you men to use it around your hogpens, stables, poultry houses, outhouses, troughs, garbage cans, drains, etc. It sure does kill lice on hogs, cures skin and parasitic diseases.

Remember, the germs of disease are often carried from farm to farm—use Dr. Hess Dip and Disinfectant to destroy the germs and keep away foul odors. Sold in pint bottles, quart and gallon cans. Buy from the dealer in your own town—he stands back of my guarantee.

So sure am I that Dr. Hess Stock Tonic will put your animals in a thriving condition, make the ailing ones healthy and expel the worms, that Dr. Hess Dip and Disinfectant will destroy disease germs and foul odors, that I have authorized my dealer in your town to supply you with enough for your stock, and if these preparations do not do as I claim, return the empty packages and my dealer will refund your money.

Dr. Hess Poultry Pan-a-ce-a

Helps Hens Lay

A splendid tonic for moulting hens. It gives them vitality to force out the old quills, grow new feathers and get back on the job laying eggs all winter. It tones up the dormant egg organs and helps to make hens and pullets lay. Economical to use—a penny's worth is enough for 30 fowl per day. 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail, $2.50 (except in Canada and the far West). Guaranteed.

Dr. Hess Instant Louse Killer

For Poultry and Farm Stock

Dust some on what you think is the cleanest hen in your flock, wait a minute, then spread out a sheet of white paper and ruffle the hen's feathers. Talk about dead lice! you'll be surprised. Sprinkle it on the roosts, in the cracks and dust bath. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans. 1 lb. 25c; 3 lbs. 60c (except in Canada and the far West). I guarantee it.

I have a book about Dr. Hess Stock Tonic and Dr. Hess Dip and Disinfectant that you may have for the asking.

DR. HESS & CLARK, Ashland, Ohio

If you have a sick or injured animal, write Dr. Hess, telling symptoms, enclose 2c stamp for reply, and he will send you prescription and letter of advice free of charge.

BETTER FARMING BETTER FARM HOMES BETTER CITIZENSHIP

THE
MISSOURI FARMER
COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE
AND THE MISSOURI EXPERIMENTAL STATION

A Christmas Prayer

Not long since, I had to spend several hours one night in a dingy railroad station in central Missouri. The agent had gone to supper and so, for a while, I was "monarch of all I surveyed" and my only diversion was studying the various instructions of general officers to railroad employees and an old lithograph of the Veiled Prophet which had seen a dozen summers come and go and which, though faded and frayed, was still proclaiming the splendors of its pageantry. After a while, however, a farmer and his stalwart young son came in and sat down a few seats from the place where I was huddled up in a corner—almost unseen. The farmer was a clean faced, intelligent and apparently poor man whose counter part may be found in any farming community in the Country. The son was a fine, bright eyed, hopeful young chap who was about to seek his fortunes in a great city—and the solemnity of the occasion weighed heavily upon both of them and the father expressed keen regret that the boy would be gone during the Christmas holidays. During the more than two hours that the three of us sat there, these two—oblivious to all their surroundings, talked of almost everything—of "Mother" and her health—of the other smaller children—of the debt which hangs over the old farm home—of the terrible foreign war and about a lot of other things trivial to all but themselves. From the first I was deeply interested in their conversation which I was compelled to overhear—for not in a long while have I heard sentiments more simple and beautiful than those expressed by this poor and yet highly intelligent farmer who was a living example of that splendid God-fearing citizenship which has meant so much to the Nation in the past and which constitutes its "Rock of Ages" for the future. I am sure that in his humble home the beautiful old custom of saying grace at the table still holds sway and as I think of the things he said to his son in the little dirt-begrimed station that night I can hear him offer up this prayer on Christmas Eve—and while he may not use my words I know I am using the thought which dwells deep in his care-worn heart.

"Our Father Who art in heaven, I thank Thee tonight that our children are well in mind and body and I beseech Thee that, in the year to come, as in the one which is almost gone Thou wilt continue to bless them in like manner. I can stand the buffeting of life's storms, however fiercely they may beat so long as the health of my loved ones is spared. Guide Thou by day and by night the footsteps of my boy who henceforward will be exposed to the pitfalls of a great city where a human life counts for so little. Help him to lead an honest and upright life and to remember the teachings of his mother who, from his cradle to this hour has taught him to reverence Thy name and never to forgetThee in success or failure.

And Father, deal gently with Mother who has been my faithful companion for these many years—whose sweet face is showing more and more the lines of care which devotion to me and mine and the long years of racking toil have brought—whose patience and long suffering know no end and whose gentle ministrations have made our home a place of refuge when all other habitations have seemed cold and heartless. Help me to be more thoughtful of her welfare and of her health—to speak more kindly and gently to her—to plant more roses along the rest of the pathway which still awaits her to the end that life may represent, in part at least, the bright visions of her young womanhood.

And I pray Thee to bless us with bountiful harvests in order that I may, while I am still possessed of the full vigor of manhood, pay off the mortgage which has so long haunted my thoughts by day and my dreams by night—that wife and I may leave it an unhampered heritage to our loved ones when our race is run. And lastly, Father, may the time soon come when there will be an end of a war which is making the World hideous and when the Savior's benediction of "Peace on Earth, good will to men" may once more dwell in the hearts of all mankind."

—By the Author of After-Thoughts.

WHAT IS AGRICULTURAL CO-OPERATION?

The cheese producers of Sheboygan county, Wisconsin, have given a practical demonstration of the benefits of co-operation, both in producing and in marketing. Wisconsin produces more than one-half of the cheese made in the United States, and Sheboygan is the banner cheese county of the state. The short and simple story of what co-operation has done for the farmers of Sheboygan county explains what co-operation is.

The farmers were selling their milk to the cheese factories, but were not getting what they thought was a fair price for their product. Some of the cheese factories were operated on the co-operative plan; that is, the farmers took their milk to the cheese factory owned by themselves and received the prevailing market price for it each month, and at the end of the year the profit on the cheese sold was divided among the farmers on the basis of the amount of milk delivered to the factory during the year. These co-operative cheese factories were not joint-stock companies, in which the profits were divided among the stockholders, or in which the stockholders controlled on the basis of the amount of stock they owned. They were organized on the basis of "one man one vote" regardless of how much stock was held by any one person. There had to be some capital stock, to be sure, and there had to be some return upon the stock. But the co-operative cheese factory was not organized to make money on the capital invested in the cheese factory. Rather it was organized to pay a dividend upon the money which the stockholders had invested in cows. Therefore, the dividend paid upon the capital stock was confined to 6 per cent. And the surplus was divided among the farmers on the basis of the amount of milk delivered. In this way, every farmer received the full return upon the milk he brought to the factory. The man with one share of stock and twenty cows received a much larger return than the man with twenty shares of stock and one cow. That was co-operation. The policy of the cheese factory was decided upon the vote of all the stockholders, "one vote, and only one, for each man." The man with twenty shares of stock and one cow had no larger voice in the management than the man with one share of stock and twenty cows. That, too, was co-operation.

But, still the farmers of Sheboygan county were not satisfied. They were selling the cheese made in their co-operative factories to the wholesale dealers in Plymouth, who fixed the price at whatever they saw fit. And the price of cheese as fixed by these dealers was so low that even the co-operative factories could not pay a fair price for milk.

So the farmers took another step in co-operation. They organized the Sheboygan County Cheese Producers' Federation to market on the co-operative basis the cheese produced in the co-operative cheese factories. This co-operative selling agency has been doing business for almost two years, and by every standard known to the farmers has proved an unequalified success. The farmers have received from 20 to 30 cents per hundred pounds more for their milk than formerly. Sheboygan county farmers have received about $300,000 a year more for the same quantity of milk than in the days when the cheese was sold to dealers. This is more co-operation.

While this is a benefit that anyone can understand, it is not the only benefit that came to Sheboygan county and to Wisconsin as a whole. Not only did the co-operators get more for their milk, but every farmer in Wisconsin who sold his milk to a cheese factory, whether that factory was co-operative or not, received more for his milk. And every cheese factory, whether co-operative or not, received more for its output of cheese.

Farmers' Co-operative Elevator

The Missouri Farmer: Your letter desiring information regarding our "Farmers' Co-operative Company," of Windsor, Mo., received and it gives me real pleasure to inform you of our methods and success.

Some good patriotic farmers south of Windsor declared that they would not pay the prices for grain, hay and other feeds which were asked by the local elevators here in 1913. The united and ordered all their feed in carloads and saved themselves much money and all of us were greatly benefitted because the dealers all reduced their prices. Then some one said why not organize the farmers and build an elevator? So some of these good farmers went about the country and made speeches at the school houses and organized lodges to help build and equip an elevator. The first general meeting of all these sub-lodges was held at Windsor in the spring. We there decided to incorporate with a capital of $6000 and elected fifteen directors to look after the erection of the building. We had the building ready to handle wheat by July 10, 1914.

We made $2000 clear of all expense by the 1st of January, 1915. Since then we have been getting along all right. I am enclosing a copy of our Constitution and By-Laws.

Hoping this may be a means of many other communities by your help of combining and doing their own business, I submit this to you with best wishes for you and success to farmers' co-operation.

W. D. Walkup.

Co-operative Elevators Successful

Editor Missouri Farmer: Enclosed find check for $1 to apply on subscription for The Missouri Farmer. I think the time is ripe for organization among farmers for self-protection. There are now some three or four Farmers' Co-operation Elevator Companies organized in Henry County and they are doing well. The one at Montrose has been buying 75 to 100 wagon loads of corn a day during last week at about 8 cents per bushel more than the price given at Appleton City where no co-operative company exists. At LaDue we have a modern elevator of more than 12,000 bushel capacity in addition to a good storage room. We have handled 6 cars of coal, 3 of chat (crushed rock for concrete purposes), 2 of flour and feed—all since September.

If you desire I will send you names and address of a goodly number of our stockholders (farmers). We have about 160.

C. A. Rice,
Henry County.

To be sure we want all the names of good farmers who are interested in oc-operation that we can get.

How can you get more for one dollar than when you pay it for three years subscription to a good paper like The Missouri Farmer? Please send the dollar now for renewal.

Get Them NOW

Eggs! Eggs! Eggs!

GILBERT HESS, M. D., D. V. S.

Eggs are high now. Are your hens laying well to make up for the scarce egg crop during moulting? With no green stuff, no worms or insects and no exercise, hens must have a tonic during the winter or they won't lay. I have succeeded in compounding a tonic that will make your poultry healthy, help hens lay and keep the egg organs active.

DR. HESS
Poultry Pan-a-ce-a
A Tonic—Not a Stimulant
Formula printed on every package

I have had Pan-a-ce-a on the market now for 22 years; for nearly a quarter of a century it has stood the test and it has made good in every nook and corner of this country. My Pan-a-ce-a has in it blood builders, tonics, and internal antiseptics, carefully compounded, which, from my lifetime experience as a veterinary surgeon, doctor of medicine and successful poultry raiser, I know will do their work.

During all these years I have never asked a single poultry raiser or farmer to buy my Pan-a-ce-a on claims or say-so, but on a genuine money-back guarantee. Here it is:

So sure am I that Dr. Hess Poultry Pan-a-ce-a will help to keep your poultry healthy and help to make your hens lay, that I have authorized my dealer in your town to supply you with enough for your flock and if it doesn't do as I claim, return the empty package and get your money back.

1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail $2.50 (except in Canada and the far West). Pan-a-ce-a costs only 1c per day for 30 fowl.

My new poultry book tells all about Pan-a-ce-a. It's free.

DR. HESS & CLARK, Ashland, Ohio.

Dr. Hess Stock Tonic
Your cows, horses and hogs are pretty apt to get out of fix during winter. Dr. Hess Stock Tonic contains tonics that improve the appetite and tone up the digestion, laxatives for regulating the bowels, and vermifuges that will positively expel worms. I guarantee it. 25-lb. pail $1.60; 100-lb. sack $5.00; smaller packages as low as 50c (except in Canada and the far West and the South).

Dr. Hess Instant Louse Killer
Kills lice on poultry and all farm stock. Dust the hens with it, sprinkle it on the roosts, in the cracks, or if kept in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy, sifting-top cans, 1 lb. 25c; 3 lbs. 60c (except in Canada and the far West). I guarantee it.

Galloway Offers Great Bargains For 1916

Four-color catalog free

1915 has proven a wonderful year. Bigger business, more customers, lower prices than ever before. Now comes 1916. Plans are all made. Factories will increase capacity and decrease manufacturing cost. Galloway customers will get the benefit Will you be one of them—and

Save 35 to 50% On Your Purchases in 1916

Get a piece of the melon Galloway will divide. Cream separators, manure spreaders, gasoline engines, farmobiles, farm implements. Everything for the farm and household. Sold direct; wholesale factory prices will make you our customer for life. Get 4-color catalog. Shipped from K. C., Mpls., Spokane, Waterloo, Chgo. or Omaha. Wm. Galloway Co., 597 Galloway Sta., Waterloo, Iowa.

Galloway Farmobile or Tractor. Right in price

Galloway's Engines. From 1 3-4 to 16 h.p.

Galloway Spreaders. Built right and work right

Galloway Separators. Perfect in construction.

The Missouri Farmer

OLUME VII DECEMBER 15, 1915 NUMBER 24

The Warren County Farmers' Association

By William Hirth, Publisher

Continuing the discussion of a werful state-wide farmers' organi-tion for which The Missouri Farmer s been making a plea for a number months, we feel sure our readers ll be keenly interested in knowing t this great new movement has en definitely launched in Warren unty. Several weeks ago, a pre-inary meeting—to which we re-red in our last issue—was held and that time a lot of leading farmers embled at the county-seat—and er the matter was thoroughly dis-ssed it was decided to launch the npaign for a County Farmers' As-iation. To this end, a committee six aggressive farmers were ap-nted in each township and these mers pledged themselves to can-s their respective townships from l to end with the idea of bringing farmers of the entire county to-her in a big mass meeting at ich the project could be finally eshed out.

his mass meeting was held at rrenton Saturday, December 4th, the reader may judge of the in-st displayed by the fact that ens of farmers were unable to wd through the doors of the circuit rt room which, perhaps never in history, held a bigger crowd. In t, not only was every seat, bench l window crowded with farmers—in every isle of the court room ree of farmers stood for three long rs while the crowd listened to Sam Jordan, who needs no introduction any audience of Missouri farmers to the writer of this article. At conclusion of the addresses the ners voted overwhelmingly to form Warren County Farmers' Associa-and to push the organization of a m Club into as nearly as possible y school district in the county.

ust C. Polster of near Warrenton splendid farmer whose heart is oughly enlisted in the new move-t and who enjoys the respect and idence of farmers throughout the nty, was unanimously elected Pres-t of the County Association. Gar-Bockhorst of Hickory Grove town-, another splendid, progressive ner, was made Vice-President, e E. H. Winter of Warrenton, a l-horse to whom much of the suc-of the new movement in Warren nty thus far belongs, was made etary. These gentlemen will e as the chief officers for the next when a regularly delegated con-ion representing all of the Farm s in the county will choose their essors.

the meantime, the six committee-from each township were perma-ly elected, and each of these men be a member of the Executive mittee of the County Association, e looking particularly after the work of organizing Farm Clubs as nearly as possible throughout their respective townships. Thus we have an organization composed of three distinct units—the school district, the township and the county—the county later on to become part of a Missouri Farmers' Association. For the present, the chief work in hand will be the organization of school district Farm Clubs with the idea of covering the county from end to end at the earliest possible date. In the resolutions passed by the mass meeting, annual dues to the amount of one dollar were recommended for all Farm Club members—50c to be retained by the school district club and the other 50c to go into the treasury of the county association. Clubs were also asked to meet at least twice per month and no member to be absent except upon good excuse.

Thus has been launched the first County Farmers' Association in the history of American Agriculture—an organization which welds the farmers of a whole county into one compact body with a strong Executive Committee which, together with the officers, is charged with looking after the interests of the farmers of the entire county—and also specifically to supervise the work in the different townships. "This looks more like getting down to brass tacks than anything I have ever seen in my life" was the comment of "Sam" Jordan at the conclusion of the mass meeting—and Jordan comes mighty near being a "bell weather" in the farm game. Continuing, he said, "Suppose we had gotten down to business this way ten years ago? Suppose at that time every county had gotten into the harness in this way? Do you suppose they would be able to rob us out of millions of dollars on hogs, cattle, wheat and other farm products like they are today? Not on your life. Now, if other counties will pull off their coats and get into the fight we'll soon show 'em whether farmers know how to organize and stand up for each other or not. Oh it's almost too good to be true"—and the last the writer saw of this thin visaged evangelist of the cornfields, he was still muttering to himself, "It's certainly fine. It's certainly fine."

It is not the idea that the school district Farm Clubs shall be clubs in name only. On the contrary, as stated above, they will be expected to hold a meeting at least every other week and a definite subject for discussion will be provided for each meeting. Thus, for instance, the following are some of the subjects which will be taken up: "Who Fixes the Price of Farm Products?" "How Can Farmers Co-Operate in Marketing Farm Products?" "How Does Dealing in Futures Affect Price of Farm Crops?" "The Land Bank Bill," "Soil Fertility," and explanation of different fertilizers, "Co-Operative Creameries," "How to Grow Alfalfa," "Is the Silo a Profitable Investment?" "Explanation of Missouri Road Laws," "Forage Crops," "Consolidated Schools," etc.

Arrangements have been made by which each of these subjects will be prepared in simple form by the "Question and Answer" method so that every club member can easily get at the gist of each subject. Copies of each subject will be furnished to club members two weeks before the matter comes up for discussion—while the President or some other members of the Club will be commissioned to act as the "leader" at each meeting night and if there is any question which isn't entirely clear to all the members, an answer will be obtained and will be available at the next meeting. Thus this plan is intended to do two things: First, to make these school district Farm Clubs the greatest agency for the discussion of vital farm questions we have ever known; and, Secondly, to prepare each subject in such a simple and complete manner that farmers will be able to thresh them out themselves without the aid of an outside "speaker." In short, the machinery has been provided which will enable each school district Farm Club to stand upon its own bottom—and that it will soon make the little local school house the greatest rendezvous for the discussion of vital problems affecting every phase of Agriculture where farmers get up behind this program in the right spirit there is little question.

Among other things, it will develop a lot of "farm leaders" who are so sorely needed at this time—teaching farmers the spirit of self reliance and the ability to express themselves before an audience which a little practice brings so easily to many men. For years the farm has furnished the Nation's greatest lawyers, bankers and business leaders. There is no soil in the World more fruitful of leadership

WHERE DO YOU STAND?

The Missouri Farmer is the first farm paper in the United States that has ever inaugurated a fight which is intended to rescue farmers from the plight which now surrounds them and which makes them the helpless victims of the industrial vampires who have long waxed fat upon their sweat and toil—and the question is, Brother, where do you stand? Are you willing to put your shoulder to the wheel and help? If so, then send us a dollar bill or a check when we will mark up your subscription for three years. It takes more than "good wishes" to buy presses, carloads of paper, ink, etc., and to pay the printers when Saturday night comes. The Missouri Farmer is a young paper and is not yet on a self-sustaining basis financially—and if we are to succeed in the great task we have undertaken we must have the help and co-operation of EVERY farmer who reads the paper. We are fighting your battles and unless we can have your support we cannot hope to win.

So, here goes a kind of Santa Claus appeal to you. First, send us a dollar to renew your own subscription. Then see if you can't get two or three of your good neighbors to do likewise—and send us a little club. There are still thousands of fine farm homes in which The Missouri Farmer is not a visitor—farm homes which ought to join in the great fight we have undertaken and upon which so much depends for the future. If YOU and every other farmer who gets the paper will do this, how tremendously it would strengthen us in the great work which lies ahead of us? During the last few weeks, scores of school district Farm Clubs have been organized—thus showing that our efforts are bearing fruit. Soon a number of new County Farmers' Associations will be formed and thus this great new movement is already well under way.

But remember that The Missouri Farmer cannot carry on this fight without your active help. For years endless columns have been written about what farmers could do if they would stand together—and now that, for the first time, a definite and practical plan has been mapped out, everything depends on the support we receive from the farmers of Missouri—and this means YOU! If the farmers of every community will get up behind The Missouri Farmer and help to make this great movement a success, there isn't the slightest doubt that it will result in saving them millions of dollars during the next few years. So, when you talk things over with Santa Claus, don't forget the paper which is fighting for your interests as no farm paper ever fought for them before—and which, in its struggles, has no one else to look to for help.

WILLIAM HIRTH, Publisher.

We are now preparing a new circular on school district "Farm Clubs" which is free for the asking. It tells you how to proceed and contains a suitable Constitution and By-Laws.

except that in the past we have lacked the agencies which call it forth. Again, where is there a farmer who whose views will not be greatly broadened by spending an evening twice per month at the little local school house discussing how the Packers fix live stock prices, how the dealing in futures affects the price of wheat and other farm crops and a technical analysis of the Land Bank Bill and what its enactment will mean to the farmers of this state? Would not you and your neighbors, my friend, be greatly benefited by a Farm Club of this kind? Wouldn't it put new zest and enthusiasm into the monotony of farm life for you? Will we be able to win the great fight ahead of us so long as farmers keep on drifting along in the old way? Again, could there be a finer method by which to get the young farmer boys of your community interested in the farm?

However, the reader should not come to the conclusion that this is all that the local Farm Clubs will take in hand. Back of this great new movement of course lies the great object of perfecting a powerful farmers' organization which, once it has gathered sufficient strength, will market the products of the farm direct to the consumer and thus throw off the strangle hold which the Packers and others now maintain upon the throat of producer and consumer alike—a situation which has placed the control of the Nation's foodstuffs in the hands of a few men and which is becoming more and more unbearable. But while we are gathering strength and girding up our loins for this greater struggle, there are many other lesser practical things which a County Farmers' Association can take in hand—and it is matters of this kind which President Polster of the Warren County Association is preparing to take up with the school district Farm Clubs as soon as they are formed.

For instance, Warren County farmers use a good deal of commercial fertilize and by ordering in carload lots for the members of a given club, it will be possible to save them several dollars per ton in the cost. Here alone is an item of no mean significance. Again, recently a carload of crushed limestone was shipped into Warrenton by Mr. Polster for use upon his farm —and the price paid, together with the freight, made the cost come close to $4 per ton which is practically prohibitive. In the meantime, there are millions of tons of fine limestone rock going to waste all over the county and the plan now under consideration is for a number of Farm Clubs to buy a rock crusher for their common use. Such a machine will cost around $700 and will crush the limestone at an expense, including labor, of about $1 per ton. The crusher can be kept in a community until its farms have been limed—and then it can be moved into the next community and not only will this plan cut the cost down tremendously but it will save a lot of long distance hauls from the railroad station. This is only another instance which will give the reader an idea of what this new plan of co-operation means.

So, also, President Polster has obtained carload prices on bran, shipstuff, oats, hay, corn and other feeds for farm club members—and the saving on every car will amount to a good many dollars. Had the Warren County Farmers' Association been doing business during the drouth years of 1913 and 1914, here is an item which would have saved many thousands of dollars to its members—and who knows but what similar conditions may prevail next year? During the above years the farmers of Colorado and other western states raised splendid crops of alfalfa and had the farmers of the average school district in Missouri been organized so they could have ordered by the car they could have saved $3 or $4 per ton—and do not such matters as these within themselves justify a County Farmers' Association in your county? Again, the binder twine manufactured at the State Penitentiary sells on an average for 5 cents per pound less than commercial twine—but it must be ordered in quantities and the authorities must also have advance notice. Then there are such items as tankage and cottonseed meal, on which buying in bulk will affect a saving worth while. Lastly, there is the feature of adding to the social life of the community—of bringing farmers and their friends, neighbors and wives together from time to time and putting more enjoyment into farm life generally.

Thus, when all the different phases of the matter are considered, is it not plain to any thinking, serious-minded farmer that indeed the "hour for action has come?" Here we have been talking about the disorganized state of farmers for years and now that a definite, practical plan has been worked out, isn't it time for you and your neighbors to get busy? Isn't it time for a little real action as well as everlasting talk! talk!! talk!!!? Again, we call upon every reader of The Missouri Farmer to pull off his coat and get to work. Call your neighbors up over the telephone and get them to promise to talk things over at the little school house without delay. Then if they mean business, begin to plan for a big county mass meeting—and either "Sam" Jordan of the State Board of Agriculture or the writer will help you agree upon a date when one or both of us will be glad to deliver addresses and aid in getting a County Farmers' Association upon its feet at the earliest possible moment. We are now standing on the threshold of the winter season—the ideal time for this kind of a movement. But there isn't a moment to lose. Every mail brings us letters from farmers scattered all over Missouri, saying, "we are ready for business"—but how about **you?** The chances are The Missouri Farmer raeches a good many of your neighbors and doubtless therefore they have also been reading these articles and are familiar with what we are trying to do. We would like to see a thousand school district Farm Clubs organized before January 15th. Will you help organize one in your? We will be glad to mail a suitable constitution and by-laws and further instructions to all who ask for them.

SALINE COUNTY'S SEED CORN AUCTION SALE

Saline County, Missouri, is fairly tingling with enthusiasm over the results of her First Annual Seed Corn Auction Sale which was sure a unique and successful co-operation enterprise and these results, without attempting to classify them according to their importance, may be enumerated as follows: 1st, An unprecedented amount of time and effort put into the selection of the seed corn which afterward found its way to the exhibit hall and auction ring; 2nd, A magnificent display of corn, "three times as big as any county show I have ever seen" in the words of Sam Jordan of the Missouri State Board of Agriculture, and, "far superior in quality to the World's Fair display at St. Louis" according to Hon. Matthew W. Hall who had charge of the St. Louis show; 3rd, 534 bushels of pure seed corn sold through the auction ring in two hours and thirty-five minutes time (by the watch) for a grand total of $1902.75, or an average of $3.54 per bushel; 4th, A whole county believing in and enthusiastic over the possibility of building up a great seed corn center where local farmers will find both a supply of and a market for seed corn; 5th, The establishment of a high standard of quality for the auction sale and a determination to maintain or improve that standard; 6th, Over a half hundred farmers already signed up as competitors in next year's contest and consignors to next year's sale.

These are not all the results. For instance, there are a number of farmers who are making preparations to start corn breeding plots following the half ear to the row method with remnants saved so that the best may be planted the following season to produce foundation seed stock; then again, there is a new sense of the possibility of co-operation among farmers that is worthy of mention.

We began by stating that Saline County is tingling with enthusiasm. So it is. The atmosphere in the county-seat town of Marshall is charged with it. It is felt in every country side and the stock in trade of the Saline County Farm Bureau, the organization behind the event and responsible for it, has gone up something like 200 per cent, according to the general impression.

This is all due to the size and impressiveness of the corn show and auction sale and program of popular and educational lectures held in connection with it. Naturally, the county feels just now that something important has taken place. For this

The prime mover in the Saline Cou Corn Show, Paul V. Maris

reason, we hastened to enumerate the very outset some of the substa tial, worth-while results that w abide after enthusiasm wanes.

A Community Enterprise

It is important to keep well in foreground the thought that this is accurate account of a commun undertaking. It represented the w of one hundred and three farmers a farmers' sons who, before the first of June last spring, signed the lowing agreement:

"I hereby make entry as a comp tor in Saline County's One Thous Dollar Corn Contest. I pledge my to comply with the rules govern the contest and to give and deliver the Saline County Farm Bureau bushels of pure, selected seed corn payment for the privilege of enter the contest. In the event of my f ure to grow corn that in the judgm of the committee in charge is p and suitable for sale for seed p poses, I then promise to pay to Saline County Farm Bureau $10 lieu of the ten bushels of corn, only on condition that my corn is such character that its sale would detrimental to the reputation of line County seed corn will I offer in substitute for corn.

Having entered the contest, I pr ise to pay my entrance pledge rega less of the yield or quantity or which I raise."

A County Agent Leads

It is not exactly correct to say the Saline County One Thousand lar Corn Contest and Auction were the work of 103 farmers. It really the work of the county ag Paul V. Maris. It was he who ceived the idea and then execute it with considreable energy and orga ing ability. He drafted the r made preliminary preparation by ting a thousand bushels of pure seed into the hands of prospective testants, did low-up work visiting the fields and der strating the per type of to select, a fa more than other respon for the exce quality and uniformity of corn in the and sale.

Mr. Maris officially ass by a comm

The two ten-bushel exhibits which tied for first place. The top lot is Boone County White from a field grown by J. E. Matheny, Marshall, yielding 94.5 bushels per acre. The bottom lot is Reid's Yellow Dent yielding 86.65 bushels per acre, raised by W. L. Smith, Napton. Watch Saline County in the future for good seed corn.

d the Farm Bureau made up of ominent farmers and cor n grow- of the county. J. M. Sphar, E. Matheny, M. W. Hall, Robert rr and Edw. Dankenbring consti- ed the committee. These men ced upon the rule book which was culated this significant statement: **ie Opportunity Awaits Some nty in the Corn Belt Region to ome Known as a Great Seed Corn ducing and Distributing Center."** s was and is the central idea und which the enterprise hinges.

However, it takes more than the re presentation of an idea, even ugh it be a good one, to get the lic, and especially the farming lic, to take hold of it. Therefore, idea was not merely tossed upon waters, so to speak, with an abid- faith that it would ultimately drift the proper harbor. It was made reat big part of the year's work of Saline County Farm Bureau and the effort seems justified. Such ements as, "The county agent has l for himself for ten years to come e does nothing else," may be heard the Farm Bureau believes that n improvement has been given an etus in a big way and that such lts could not have been gained by fetime of lecturing and writing.

The Plan

he general plan of the contest and tion is very simple. The two fea- s are combined and organized n a self-supporting basis. Each testant promises to give ten bush- of corn or ten dollars in lieu eof if his corn crop failed or if corn could not pass inspection. s pledge was necessary in order to rantee the prizes. It is note- thy that of the 103 contestants fifty e with their carefully selected l corn that passed the inspection mittee. It was an unfavorable son too for all low ground subject verflow and not well drained. Less n one week after the close of the e every contestant who did not g corn, with a dozen exceptions, paid his cash fee of ten dollars. refore, the gross receipts from the and contest approximate $2400. committee in charge expects that y pledge will be paid willingly. of this $2400 the committee has $1100 in cash prizes, purchased distributed 750 one-bushel corn es, paid advertising bills and met ental expenses and will have a nce of over $500 in the sinking . This will pay for some prelim- y advertising next year and serve sort of guarantee in case of bad her interfering with the success e sale.

ntestants were ranked according grade based 75% on the yield per and 25% on the quality of the bushels submitted as an entrance This ten bushels was selected the entire crop and not necessar- wholly or in part from the meas- acre. The idea was to bring the and purest corn on the place. e, interest in the contest and the that quality was a factor in de- ining awards were the incentives rd careful selection. The one sand dollars was divided into ten s ranging from $300 for first to $10 for tenth.

ch acre was measured by the measure, the corn was weighed, shelling per cent determined, the ture test made and yield com- l on the basis of dry, shelled corn cre.

e highest yielding acre was grown boy 17 years of age who obtained 103.8 bushels of dry shelled corn. His name was Charles Miller and his home is in the Fairville neighborhood of Saline county. A neighbor boy named Marion Miller, but not at all related, grew 102.5 bushels on his acre. Charles Miller won first in the contest and received prizes in all amounting to $335.

The Show

The 534 bushels of corn made an imposing exhibit. It surprised, pleased and even astonished both the home people and visitors. Prof. J. C. Hackelman, who acted as chairman of the committee of judges, expressed doubt if such a display of seed corn had ever before been made. It certainly was a greater showing than the corn department of state fair presents and, according to the writer's observations, there was more good corn and less poor corn than was to be seen at any one of the last three state corn shows at Columbia.

Large rows of ten-ear, pyramids extended across the commodious exhibit hall and in front of each one hundred were the ten crates containing the remainder of the ten bushels of corn. Prof. Hackelman was assisted by F. L. Duley and C. E. Carter in the work of judging. Every entry was conspicuously placarded with the judges' score and after the judges' work was completed, with the exhibitor's name so that the visitor could do what he cannot always do at a show or fair, namely: observe the exhibits understandingly.

The Sale

Fifteen hundred people, by count, mostly Saline county farmers, assembled at the auction ring. Cols. Jas. Sparks and C. J. Irvine officiated. Bids were received on one bushel with the privilege of taking the entire lot of ten bushels or any part of it. Every lot was sold on its merits. Mr. Maris announced the name of the grower, the score given by the judges, the source of the seed from which it was grown and the yield per acre obtained by the contestant. The buyers showed unusual discrimination in their bidding and paid prices harmonizing closely with the judges' score.

Two ten bushel lots tied for first place on score in the contest and they brought $138.50 and $120.00. Mr. J. E. Matheny's Boone County White yielding 94.5 bushels per acre brought the first named amount. The separate bushels went as follows: Rose & Buckner, 1 bu., $25; E. P. Dyer, 1 bu., $17; O. H. Madorie, 1 bu., $15; Azo Potter, 1 bu., $10; C. O. Walker, 1 bu., $10.50; F. M. McRoberts, 2 bu., $10 each; Houston Bros., 1 bu., $13, and C. J. Irvine, 1 bu., $14.

The entry tying Mr. Matheny's was Reid's Yellow Dent yielding 86.65 bushels and exhibited by W. L. Smith of Napton, Mo. The individual sales ranged between $10 and $15 per bushel.

Lots were sold to buyers in Indiana, Iowa, Kansas, Oklahoma and a few Missouri counties outside of Saline. However, the large part of the corn, and all the higher priced corn, went to those who expect to be heard from in next year's contest.

We repeat in closing that the greatest of all results of this unique co-operative enterprise fostered by the Farm Bureau organization of Saline County is that the farmers are behind it willing to dedicate their efforts toward building and maintaining a reputation for Saline County Seed Corn and toward making the Annual Sales of the future surpass the initial endeavor. Robert J. Howat.

SUPERIORITY OF THE JERSEYS

The demand for milk cows and good prices at which they are selling at the present time is a feature of the live stock market. The increasing population and realization of the fact that milk and milk products are about the cheapest and most wholesome foods we can buy are stimulating that demand. Along with this also comes the demand from the consumer for a product of quality. Of course if milk became so very scarce he would buy skim milk if he could buy no better but as long as he is able to buy real milk with good cream on it, that will be his choice and he will be willing to pay for it. This is where the Jersey cow horns into the argument.

If you are buying real Jersey milk with rich cream on it and that fine color, can a Holstein man come along with even the lower price and make you change? Not often. But reversing the proposition. You are buying Holstein milk and have good reason to know of the quality sold by the other fellow. How about it then? From the writer's personal experience the change is usually made at once.

In short, what the public really wants is quality, price is an after consideration.

Scarcity of milk makes a temporary demad among the dairymen for the Holstein cow but when milk is plentiful it takes a salesman with the elastic, persuasive, argumentative qualifications of a lightning rod agent, to sell it in competition with Jersey milk.

The writer speaks from experience on both sides of the fence. He did not have the necessary qualifications in the sale of Holstein milk, but customers "beat a path to his door" for the Jersey product. So long as people drink milk, eat butter and ice cream, just that long will the Jersey products outsell the others.

These are of course only a few of the many reasons of superiority, but as a dealer they are reasons which appeal to me most forcibly.

D. V. Vandiver, Columbia, Mo.

WHAT FERTILIZER SHALL I USE?

"How am I to find out what sort of fertilizers I need for my crops?" is a question very common now-a-days. Many think there is no way to find out except to have the soil analyzed or carry on a series of experiments. Since many farms have several soil types, as well as varying degrees of fertility to get at the answer by means of soil analyses would not seem feasible. Since it is expensive to make a chemical analysis, and also since local conditions would, of course, be unknown to the chemist, what he might find out might not just fit the case.

The farmer may be his own best judge by being familiar with only a few simple facts, which every one would do well to understand, and since these facts or principles are so simple, there should be no reason in the world why he may not understand them.

The answer to the question at the beginning of this article is always answered by the growing crops themselves, by the manner in which they "behave" through a series of seasons.

If one understands the following simple truths he should be able to readily read the story that the growing crops tell him.

There are three chief elements of fertility that concern us for the present, namely, nitrogen, phosphorus, and potassium. If we can arrive at what each one of these elements has to do in plant growth, and how each is indicated, it ought most certainly to put us on the "trail" of knowing what the soil may have in sufficient amounts. Also what ones it may lack.

A familiar example may make it clear. It is well known by every farmer that when he sows wheat or oats in an old feed lot he does not get as much grain in proportion to stalk or straw as he should get. He also notes that in the small grains growing in such soil that the grain does not only not fill well but lodges or "strawfalls" badly. There is most surely a cause for this condition. The cause is that the soil is "out of balance" as it were. Cake may be a "rich" food but it may not feed the body all over in the right proportions. This feed lot soil is the same.

For the present purpose let us say that nitrogen causes great growth of stalk or stem and gives to the foliage the dark green color we like so well to see. The feed lot then surely has the nitrogen. But phosphorus is chiefly concerned in filling the heads full of plump grains. This did not occur in the feed lot soil, hence it did not contain the right amount of phosphorus or the phosphorus was not available. It is potassium or potash that helps to give stiffness to the stem. We note the straws "fell" badly, hence the soil was likely to be short on potash.

Many times we note a soil produces potato "tops" splendidly, but no potatoes are produced. No, George, I do not think that is caused by planting in the wrong "sign of the moon," but is due usually to a lack of potash in the soil. Wood ashes will commonly correct this trouble. If the ashes cannot be cheaply secured buy muriate of potash on the market. The season, it should be remembered will have sometimes much to do in the case and one year's observations may not give trustworthy conclusions, but observations through four or five seasons or for one seasonable year should help one materially in learning his soil needs.

Many have feared to use commercial fertilizers believing that they "killed" the soil. The soil was not "dead" when it was first put to a crop, but constant cropping not only robbed the soil of its fertility but robbed it at the same time of humus or vegetable matter, and **no soil without humus or vegetable matter can be productive.** When we use commercial fertilizers we only return to the soil a part of what we took out by the crops. Commercial fertilizers do not presume to contain humus and unless we keep up the humus by manures or once in awhile feeding down crops or turn under green manure crops, the soil will lose its power to produce, no matter how fertile it may be. It is not commercial fertilizer that "kills" the soil but it is our neglect to keep up the supply of vegetable matter that renders the soil unproductive.

Some soils are also lacking in lime. Ground limestone applied from two to four tons per acre has often a gratifying effect, especially on root and tuber crops. Sam Jordan.

FARMERS MUST SOLVE THEIR OWN PROBLEMS

We are told that of the wealth produced in a given year, agriculture was to be credited for $9,000,000,000. Another feature of importance of this great occupation is that 36 per cent of the population is engaged in it or is supported by it. Despite this vast showing, agriculture taken as a whole in this country, has not prospered. It is agreed that there must be changes. These changes may be centered about three things: (1) better agriculture, (2) better markets, and (3) better financing. Better agriculture is fairly well taken care of through the work of the department of agriculture, in the activities of the many farming associations, by the training afforded in the schools and colleges. But, it has been clearly shown that better agriculture depends upon an adequate system of finance. The fact is that the markets and the financing of agriculture remain about as they have been for the past quarter of a century. Improvements, of course, have taken place in the quicker transportation of products and in prompter financial service. Yet these have not touched the real problem. The farmer is still compelled to rely upon the market machinery, with which he has had little or nothing to do in the matter of its organization, to take the product to the consumer. The problem of marketing, not only includes the proper standardizing of the product and the placing of it in satisfactory carriers and containers, but it has to do with the transportation, the display in cities, the sale of the product and the accounting for moneys received as well.

Between the farmer and the consumer there is a great commercial and financial gap. In the mercantile world this gap between the producer and the consumer is being bridged rapidly by the establishment of the necessary machinery of branches and agents. But, the farmer is playing the game alone and finds it increasingly difficult to protect himself against his own ignorance and his isolation in the commercial world.

The great industrial organizations have learned that co-operation between their different parts are absolutely necessary to their success. Thus, the producers of iron ore are organized for the transportation, melting, manufacture and sale of their product to the consumer. Many other industries have found it necessary to do the same thing. Necessarily, agriculture with its many individual producers, occupies a very different position, but the difference is not so great that the farmers cannot as a group profit by the lesson taught by the experience of these great industrial organizations. The farmer should come to a larger appreciation of the necessity of co-operation between the agricultural groups. It is not a question of socialism or individualism, or Democracy or Republicanism—it is a question of efficiency and social betterment.

Agricultural difficulties are so far reaching in their social effects that they must be worked at in a new light. It is time for a great agricultural society on a national basis to study and formulate the principles for the expansion of the nation's greatest business. How can individual farmers work with their neighbors? How can neighborhood groups work with other groups of a similar character? The confusion of the present cannot continue. This necessity of mutual understanding is not simply one confined alone to the agricultural group, but it has a far wider application, as shown in the experience of England and France in the present war. The organization of agricultural groups under co-operative systems would mean a more adequate and systematic supply of food products in times of distress. Such an organization, however, will have the good will of all so long as it deals in generalities about the existing situation. But so soon as it may agitate for changes in the economic methods of distribution it will have the hostility of some of the adherents of present methods. It, however, must be taken for granted that any change likely to modify situation will find obstacles in their path.

There is still a third element in this problem to be considered. 'Financing the farmer' has been discussed by everybody nearly everywhere. Many suggestions have been made as to methods, but only a few feeble steps have been taken. Without question, no great industry can progress unless it has an adequate system of finance. The commercial world long ago learned this and the farmer must come into a clearer appreciation of its meaning. As yet, no plan has been attempted and no details have been made clear. It is now time that both be done. It will therefore be seen that a great problem of vast extent and an enormous difficulty exists in the marketing and financing of agriculture.

In the final analysis, no one is going to solve the farmer's problem for him. He must do that for himself. Nor will he solve the great problems of marketing and farm credits by his clannish attitude of class spirit. The problems are fundamentally economic and must be based upon sound principles of business and finance. Hence co-operation becomes the key-note working, as it does, for results in the standardization of products and in the hopes for a syste mof finance that will do for farm business what the banks have done for commercial enterprises —Frank L. McVey, President National Conference on Marketing and Farm Credits.

Why not get busy right away and organize a farmers' club in your school district. There are three things you can discuss this winter that will help you keep the club moving: Better Farming, Better Marketing, Better Rural Credits. These are questions which mean much towards the success of all farmers and a study of them will help us arrive at the right conclusions.

BRINGING FARMERS TOGETHER

When you have surplus farm seeds, live stock, farm implements or any other farm necessity for sale—or when you want to buy any of these things—haven't you often wished for some agency which would bring you into immediate and direct touch with farmers who want to buy or sell them? Undoubtedly the demand for such an organization has long existed and The Missouri Farmer is now offering such a service to its thousands of readers through its newly established "Farmers' Market Club" of which we trust the majority of our subscribers will want to become members at once. On the first of each month a bulletin will be issued and mailed to all "Market Club" members and in these bulletins any member may list free of charge the things he has for sale or the things he wants to buy—and that it will soon become a great clearing house for all kinds of farm seeds, farm implements, live stock, etc., goes without saying. Likewise, if you want to sell or rent a farm or hire farm help it will be an invaluable medium—as well as for countless other things which some farmers have for sale and which others want to buy. Already the members of our "Farmers' Market Club" are listing a lot of fine seed corn, cowpea seed, Sudan grass, dairy cows and other similar things which they have for sale—while others are listing the things they want to buy. All members are required to give a bank reference so that other members can look up their standing before any money passes between them—for only farmers of integrity will be allowed to belong to this organization. Where members are in the market for hay, bran, ship-stuff, corn or oats, we are prepared to quote carload prices direct from the elevators, grain companies and from farmers who live in communities where a surplus has been produced—and in this way the "Market Club" will save hundreds of dollars for its members on feed. In short, by this new method, the buyer and seller of all kinds of farm necessities are brought into direct touch with each other through the bulletin which all "Market Club" members will receive on the first of each month.

For $1.50 we will mark up your subscription to The Missouri Farmer for two years and this will also entitle you to two years membership in the "Farmers' Market Club"—or at an extra cost of only 25c per year which is just intended to cover the cost of mailing the monthly bulletins. Already we have a nice bunch of members and the first bulletin is ready to be mailed. We have long felt that The Missouri Farmer owes this kind of a service to its readers for during the year we receive hundreds of letters from farmers who have things to sell and others who want to buy. Hence, when you send in your dollar to renew your subscription to the paper, be sure to add 50c extra for two years membership in the "Farmers' Market Club."

AUSTRALIAN PLAN OF RURAL CREDITS

Australian states and New Zealand countries which are leading the world in many humanitarian experiments, have the most highly organized and most successful rural credit system of any country. If the commission that went from America to study rural credit systems in Europe had visited Australia as well, there would have been no difference among them as to what should be done in the West. The British Columbian commission which visited both Europe and Australia has adopted the Australian system. It is an operation in the development of agriculture and the financing of farmers in German Poland and in the great territorial province of Germany in South Africa.

My belief in the Australian system is based on an acquaintance of eight years as a member of the commission that was entrusted with the management of state aid in irrigation settlement in Australian state of Victoria.

When I went to Australia conditions there were almost a direct counterpart of those now confronting irrigated agriculture in this country. Costly irrigation works had been built but the water was not being used. The number of farmers on irrigated areas was decreasing. Men who were without capital could not buy the land and those with capital did not care to. Irrigation works were unprofitable, because there were not people enough on the land to cultivate it as successful irrigation requires.

The government determined to change this, and it considered two plans. One was to further extend existing tenant farming which would not disturb the large estates. The other was to iaugurate through government purchases and subdivision of large farms a rural life where each man would own the house he lived in and the soil he tilled. The state began an investigation to find out how much money would be required to improve and equip that farm for intense culture. Then a study was made on the ground of the state land-purchase systems of New Zealand, Ireland, Denmark and Italy. A conference was had with officials of the German Empire in charge of state aided land settlements in German Poland and Southwest Africa. In all this study of what the state could safely and wisely attempt, land settlement was considered as a social and economic problem rather than, as in America, a means of making a profit out of land sales.

This preliminary study showed that the success of a settler largely depends on two things: First, obtaining a living income from his farm within a year; and second, getting the whole of his land into cultivation and production inside of two years. The state's plan of irrigation development included, therefore, building of houses for settlers, leveling and seeding a part of the farms, the placing of a practical farm instructor over every area of 20,000 acres or less and the lending of money to the settler to complete the development. In all this the state was amply protected. While the settler was only required to pay a deposit of 3 per cent on the land and was given 36½ years' time in which to complete payments, he paid a 40 per cent deposit of the cost of nearly all improvements and was only loaned up to 60 per cent of the value of permanent improvements made himself.

The state obtained money at 4 per cent and loaned it at 4½ per cent. The one-half per cent margin is intended to meet losses from bad debts and pay any expenses of management that may not be met by the increase in the price of subdivided land. The financial operations of the system have been satisfactory; the accumulated surplus due to the difference between the interest paid by the state and the interest paid by the settler amounted in the last report received to something over $500,000.

The adoption of this system by the state has not cost its taxpayers a cent. On the contrary, it has brought them a direct profit of a half million dollars. It has stopped the drift of the young men from the country and attracted to the land scores of young men from the cities. It has created opportunities for hundreds of poor men who without it would have never been landowners. Under its operations more than four thousand farmers, all starting with limited capital, now live in their own houses and are landed proprietors. It has given the people better houses at less cost, better live stock, better tools than they could have obtained without the financial aid and the expert knowledge and advice that went with the system.

There is an opposition in this country to state action of this character on the ground that the state is incompetent and that all this can be done by private enterprise. The conclusive answer to this is the success of state action in other countries with conditions like our own and the absence of a single successful system of either private or co-operative rural credit where the conditions are like those in the west, Germany, with that thoroughness and business sagacity so characteristic of the nation, did not attempt to extend the Landschaft or any other co-operative system in the development of Poland or Southwest Africa. Instead it adopted direct state action along the lines of the Australian states. The reason why the state can do this successfully and the reason why private or co-operative effort cannot is that the basis for this action is the general welfare and not profit. It is the creation of better conditions in rural life, the bringing into cultivation of unoccupied land, increase in production and taxes. All these things are gains to the public of which the state is the representative. They can not be shared in by any private undertaking.

In adopting this system we have abundant precedent to guide us. We do not have to break any new trails. It is entrusting the creation of new communities to the only authority which should exercise this power and the only one that has the resources, the continuity of existence and the disinterestedness needed to insure the results desired.—Dr. Elwood Mead, member California State Rural Credits Commission.

[One point of great importance brought out in the above address by Dr. Mead is that Australia working under a plan very much like the Missouri Land Bank and with the same margin of one-half of one per cent has piled up a net reserve of half a million dollars and the plan has not cost the state one cent. Furthermore, it has created opportunities for hundreds of poor men to become landowners.

We expect these things will be realized by the Gardner Land Bank Bill.]

Solution of the Trust Problem

The Missouri Farmer: You will find enclosed a check for one dollar to be placed to my credit on subscription to The Missouri Farmer. The Missouri Farmer is by far the best farm journal published so far as we farmers of Missouri are concerned. Keep it coming. I am very much interested in your articles on organization of farmers or farmers' clubs and have thought for several years that this was the only solution of the trust problem in regard to farm products.

I believe that an organization that is strong enough to enable us to sell direct to the consumer is the best plan to adopt.

We may organize a club in this vicinity after the holiday season is over.

I also like the articles on the front page written by the Author of After-Thoughts.

I wish that every farmer in Missouri could be induced to subscribe for and read your paper. I'm sure it would mean "Better Farming", "Better Farm Homes" and "Better Citizenship" for our state. W. W. Daily,
Chariton County.

Favors the Land Bank Bill

Editor The Missouri Farmer: I have been reading your most excellent paper for several years and think it gets better all the time. Your articles on farmers' organization strike the right spot. If every farmer in Missouri could read these articles and would take heed in a few short months we would see a change we never saw before. I think the Gardner Land Bank Bill would be a grand thing for the majority of the people in the state and they should see to it that it carries. Your suggestions on a farmers' packing plant looks good to me, and I would suggest that you try to organize a plant of this kind and as for a starter you can put me down as one of the one hundred thousand. If there is a plan any better I am in for what will be the most benefit to the general public. John H. Warford,
Pattonsburg, Mo.

[Let every farmer get busy and show that he is ready to help himself as Mr. Warford suggests. Let us begin this co-operation by forming clubs and buying our fertilizer, feed and binding twin in car lots. Co-operative elevators will help us market our grain and after a while we will be ready for the co-operative packing plant.

New Home for the Standard Poland China Record Association

The Standard Poland China Record Association will dedicate their splendid new office building at Maryville, Mo., January 5th, 1916, the date of the annual association meeting. The above is a good picture of the new building.

The building, which has just recently been completed, is a one-story structure of brick and stone, with a frontage of 46 feet and a depth of 56 feet. The construction throughout is as near fire-proof as possible. The building contains eight rooms which include a lobby, secretary's office, directors' room, general office, vault and cloak room. The floors are of oak and the other interior woodwork is done in a silver-gray finish. The building and fixtures represent an investment of $15,000.

So far as we know, with the exception of the American Jersey Cattle Club, the Standard is the only Record Association owning and occupying their own building. The affairs of the Standard are in a highly prosperous condition and the increased business the association is now handling made it necessary to provide larger and more satisfactory quarters. The Secretary, Ray Davis, who has been in direct charge of the building of the new office, extends a hearty invitation to all Poland China breeders to visit Maryville at the date of the annual meeting.

Why Not be Happy While Making Your Pile?

Read the same paper Millions of Farmers read; the only one that really helps country people think straight and live cheerful.

You are looking for happiness; every human being is. Try the Farm Journal method for getting it. 5 years $1.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII December 15, 1915 No. 24

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

DAIRYMEN SHOULD WAKE UP

For thirty years the greatest handicap to the deelopment of the dairy business in this country has been the powerful and dishonest methods of the oleomargarine interests. There may have been some honest manufacturers of oleomargarine who were satisfied to place their product on the market on its own merit and under its true name but we confess that we have never met up with them. Furthermore, the oleomargarine manufacturers have had the help, passive if not always active, of thousands of breeders and feeders of beef cattle and hogs who have been led to believe that an unrestricted sale of oleo products would enable packers to pay more for cattle and hogs. This fallacy has long since been refuted in the minds of men who have given the question any thought but had it not been what beef raiser is there who would want to profit by the fraudulent sale of his own product and at the expense of a brother farmer who was trying to make an honest living milking cows?

In the beginning of this fight there were some dairymen so extremely radical in their views that they would have prohibited by law the sale of oleomargarine altogether. But the saner view and the one held now by the organized dairy industry of the country is that oleomargarine should be permitted to be sold honestly for what it is but that every one who buys it must be protected from fraud. The present Federal law on the subject which places a regulation tax of ¼ of a cent a pound on uncolored oleomargarine and ten cents a pound on oleomargarine colored yellow in imitation of butter has gone a long ways toward stopping the unfair practice of selling the oleo product for butter.

The danger ahead we want to call attention to just now is that the packers will make a desperate effort during this session of Congress to repeal the 10-cent tax on colored oleomargarine. Every farmer should write his Congressman and Senator and protest against the repeal of this tax unless at the same time Congress amends the law so as to entirely prevent the coloring of oleomargarine in imitation of butter. Let both products sell on their own merits. That is all we ask.

In the interest of this fight against the packers we reproduce the following letter sent by the Secretary of the Missouri State Dairy Association, P. M. Brandt, to the members which should bring a thousand dairymen to the annual meeting of the association to be held in Columbia during Farmers' Week:

From recent developments it appears that during the Congress which has just convened another effort will be made by the manufacturers of oleomargarine to put through a law which will permit them to sell their product as butter.

It appears that the packing interests are purchasing the cotton seed oil and meal mills in the South. It looks as though before very long they will have complete control of this part of the cotton industry. This probably accounts for their unusual activity in conducting a publicity campaign in the South, in which an effort is being made to convince the people of the South that unless the packers are permitted to color oleomargarine in imitation of butter and use large quantities of cotton seed oil in its manufacture the cotton industr y is doomed. Packers are even carrying on a campaign in the northern sections of the country attempting to convince the consumer that dairy products are not wholesome and that they are unsafe to use, while oleomargarine, particularly colored oleomargarine, is exceedingly pure and wholesome. I merely mention these facts to show you what the dairy industry will probably have to face during this coming session of Congress.

The Missouri State Dairy Association will meet for its annual meeting at Columbia during Farmers' Week, January 3-7, 1916,. It is important that a large number of old members attend and that those who have not paid their membership dues do so at once. There are not sufficient funds in the treasury to carry on a campaign for the defense of the dairy industry that may be necessary.

This is but one phase of the great fight The Missouri Farmer has been making in the interest of its readers but it is a most important one. But the dairymen can not win the fight alone, it will take the combined effort of all the agricultural interests to win. Let every man resolve to do his part and do it now.

DO THE PACKERS CONTROL PRICES?

For a number of years live stock owners have been asking themselves the above question but recent developments seem to have convinced most meat producers that the packers absolutely control the price of live animals as well as the price of the dressed carcass. Feeders are just waking up to the fact that the packers have been piling up millions of dollars of profits while the growers and feeders of live stock have put up with barely a living. Recently the Cudahy Packing Company issued $2,000,000 new stock giving it free to the holders of $3,449,500 of common stock. This means that for every $100 of stock the owners will from now on draw dividends on $158. This shows why it is the packers have the money to control in addition to the meat business the fertilizer trade, hides, dairy products, oleomargarine, eggs and poultry, cold storage plants, cotton oil mills, millions of acres of land in South America and other things too numerous to mention. Only a few weeks ago one of the big packers was fined $5000 for a violation of the laws of Missouri but what good has it done? The thing to have done was to drive them out of the state. That is the way the Texas courts are handling them. According to press dispatches three Chicago packing companies, Swift & Co., Morris & Co. and Armour & Co., were fined $40,000 for infringement of the Texas Anti-Trust laws and the companies agreed to accept a perpetual judgment restraining them from owning cotton-oil mills and cotton gins in the state of Texas.

There is only one way so far as we can now see whereby farmers can get a fair market for their products. That method is co-operation in marketing. Co-operative marketing can be made effective with a strong organization behind it and in no other way.

Let the farmers of Missouri wake up to their danger and try to bring about the organization of every school district in the state.

WHO WILL PROFIT FROM BETTER RURAL CREDITS?

A subscriber writes to ask the above question and wants it answered through the paper. Well, the first man to be benefited by a good system of rural credits such as the Missouri Land Bank provides will be the man who is deeply in debt for his land. This plan will help the borrower because it will give him a lower rate of interest and because it will allow him to pay off his loan a little at a time. We consider the benefits to the borrower about as great on account of this small payment spread over a long period of years as it is on account of lowering the rate of interest.

Indirectly every farmer who owns his farm and operates it will be benefited by this law because of the increased prosperity of farmers as a class. There are men mean enough to want to make money off the poverty of others but I trust such men are not found among the readers of The Missouri Farmer. The man who occupies a farm expecting to make of it a life-time home will do more to improve it than the man who thinks he may possibly be "closed out" within five or ten years. There is a community value to every substantial improvement made on any farm. Every dollar spent on better barns, houses, fences, drainage, etc., helps the whole community and it is this larger benefit that is shared in by the man who owns a farm free from debt.

Briefly we would say every man in the state will be benefited by any system of farm finance that will encourage home ownership in place of tenantry and that will promote a better and more permanent system of farming.

A SUGGESTION TO OUR READERS

We believe the time is ripe to hold a great state meeting of farmers to consider the marketing of farm products and to lend an added impetus to the organizing of County Farmers' Associations with the idea of later joining them together in a powerful statewide organization. To this end, we hereby suggest a great farm conference in Columbia during the coming "Farmers' Week" which will meet from January 3 to 7. This will enable those in attendance to hear the "Farmers' Week" speakers—and many of them are men with a National reputation on farm subjects—and then one meeting can be given over to a big farmer conference which can take up the overshadowing question of marketing farm products and an address can be issued to the farmers of the state which is certain to prove a tremendous stimulus to the organizing of Farm Clubs.

Furthermore, we trust that farmers will act on this suggestion by communities. At a cost of $25 per day (on a three-day basis) a tourist sleeping car which will accommodate 28 persons—one to each berth—can be hired. If two persons occupy the same berth the car will accommodate twice the number. In this way there will be no changing of trains for the cars are switched straight through from one railroad to another and since the occupants can sleep in the car while they are in Columbia it does away with having to hunt for rooms or having to go to a hotel—and in the end it is cheaper and much more convenient. So why not make up a "carload" from your community? And why not bring the women folks along? What finer little outing could the farmers and their wives in your neighborhood have? Why not get busy at the telephone at once, make up a sleeping car full and then tell your railroad agent to get busy and have the car there on time? If there is a Farm Club in your neighborhood, why not bring the whole club? Why not have 5,000 farmers take part in a great farm conference at Columbia during "Farmers' Week?"

The women folks will have plenty to interest them because many of the lectures have to do with Domestic Science and other subjects which are of interest to farmers' wives. On the other hand, the men can listen to as many of the famous lecturers as they please and then participate in a great farmers' conference which can deal directly with those vital questions upon which depends the farm life of the future. Beyond the slightest question a ringing appeal issued to the farmers of the entire state from such a body of men would do much to arouse the farmers of Missouri as they must be aroused if they are to be rescued from conditions which are robbing farm life of its profit and pleasure. So get busy and make up a delegation from your neighborhood at once. There is no time to lose. If farmers will act on this suggestion promptly the side-tracks in Columbia should be full of sleeping cars.

THE MISSOURI FARMER, Columbia, Mo.

A VETERAN'S ENDORSEMENT

To The Missouri Farmer:

Enclosed find check to pay my subscription to The Missouri Farmer. You are getting out a most excellent paper and you deserve the thanks of every farmer in the state for the stand you have taken in their behalf.

I have just read your editorial in December 1 edition on "Is It a Hopeless Condition?" and it so aroused me that I thought I must write my approval of your stand. I was raised in Ralls County, Missouri, and educated at Westminster College and came to Saline County in 1857 where I now reside. Am now living on the farm I bought 55 years ago and if I were ten years younger (I am now 84) I would like to join you and organize a farmers' club to fight for farmers' rights. But the generation I have worked with in the Grange and other organizations has served its day and younger men must take up the work if it is to be done. But I would be glad to lend encouragement by my presence and counsel, for I believe with you that farmers are facing a crisis and should arouse themselves.

You have given the farmers sound advice and if they will act upon it rightly I believe we can free ourselves from those who would keep us in bondage.

Some of my neighbors have said they were ready to quit feeding stock for market. But what will we do with the fine crops of corn we have raised? Our land will lose its fertility if we quit the stock business. So, it is folly to talk about quitting.

Your editorial fits the situation exactly as I see it and I hope it will arouse the younger men to action.

J. C. Keithley, Saline Couty.

CORN SHOWS AND FARMERS' INSTITUTES

The corn show and farmers' institute at Platte City was well worth bragging about. This one held on November 29-30, as I understand, was their first effort. If they improve as fast as they do in some places in a year or two some big pasture or field will have to be the place for holding it in order to accommodate the crowd and the corn. Every lecture, they told me, was listened to by a crowded house. I was present on the 30th only. On that day there was more than a "crowded house," all standing room inside and a good deal outside was used as all entrances to the big circuit court room were filled with those desiring to hear. Maybe the reason they took the punishment I gave them for nearly two hours was because the crowd was so thick they could not get away. I have never seen more intense interest than was exhibited at Platte City.

The amount of corn on exhibition was fully as large as I have seen in the state, and the quality was also good. The weak point with those showing corn was in selection. There is a lot of good red blood about that place and it had surely been busy.

A gentleman from Whitesville where they have perhaps the greatest annual show in the state and open to the world, had some corn "not on exhibition" but just to advertise his seed, and the folks at Platte City caught the idea. They asked me to select 10 ears out of 110 ears in the show, and secured two most excellent samples, one of which could win in pretty warm competition.

When my "performance" was over they rushed me out of town fast as possible and headed me toward Kansas City. I did not tarry long in that town, but took train for Louisiana, where a corn, apple and poultry show is on at this writing. I have gone over a part of the corn and there are several samples very excellent. The finest sample, however, is one of Johnson County White from near Palmyra. The apple show is good but not up to several I have seen this season. The poultry show is also good, so far as I can tell.

My next stop is at Marshall, December 3 and Warrenton on the 4th. Then home for 22 hours and 10 minutes.

At Alton, in Oregon County, I saw a man whose life ought to put many of us who complain and whine to shame. His name is Henry B. King. Almost as soon as I reached town he hunted me up to make my further acquaintance. He said his son knew me and he had read a good deal that I had written and he wanted to meet me personally. I noted during my time there that he always seemed cheerful and when I saw him in my audience I could not refrain becoming sentimental. His misfortunes have been many, yet he is "on the job" every day doing his very best, and you may not wonder at my feelings running riot when I tell you that he has suffered two "burnouts, that were pretty bad, has had a leg broken a time or two, he cannot hear a sound and his 'good right arm' is gone."

What is your candid opinion of the greateness of that soul, now confined in that maimed and crippled body?

Marshall, Dec. 4.—Yes, Marshall and Saline County have done themselves proud. Don't let it take your mind away, but here is a corn exhibit I think equal to any three counties combined that I ever saw, and such corn! —all white or yellow; no scrub. The feature is a sale of the seed corn and all offered is in bushel crates.

Of course County Agent Maris did not do it by himself but he must be given credit for being the moving spirit, and the good to the county and its farmers by placing this high class seed in the hands of so many farmers of the county will more than compensate the county for all Mr. Maris would cost the county for the next ten years.

It might be argued that this could have been done without Mr. Maris, or any other county agent. That may be true but in Saline County it never was so done. In his work he has some as good helpers as can be found and many of them. Had the people not responded to his call, of course, nothing would have resulted. At least some "busy bodies" have been busy in Saline County. I know for the reason that I have been to Saline County several times in former years and I always hated to go. I could not get more than a dozen or two to attend and one occasion they took me around town to help "drum up" a crowd and maybe you think I do not hate a raw deal like that?

I knew something was wrong with me or with Saline County and I had made up my mind that Saline County was one of the "deadest" places on earth except the grave yard. But, oh, you Saline County! December 4th! I believe the biggest corn show ever "pulled off" in any county in Missouri and hundreds and hundreds of people to see it. And how glad they all seemed to be! Saline County, alive! Yes, sir, very much alive, indeed! and the big court room jammed full and standing around the walls to hear.

Another case of how much better a fellow or a county feels standing straight up in the first row of progress, doing for the common good, than to be lagging at the tail end ashamed of oneself and apologizing, with all sorts of excuses why you or your county or your town is never heard from.

Sam Jordan.

By Old Jim Riley

"This talk of them Europeans bein' "sore" at us because the Packers and others are makin' a lot of money by sellin' 'em pickled pig's feet and gunpowder is gittin' on my nerves. Just because the only fights we've had over here fur a long while have bin with hog cholery and the foot and mouth disease ain't sayin' that the American eagle has becum a turkey by a long shot.

BUCKSHOT BY THE PROFESSOR

Here's wishing the whole outfit of you a Merry Christmas.

Every time one of these old codgers who always swears that nobody is honest eats at my house I feel like counting the knves and forks after he gets away from the table.

Now here's a little quiet hunch old fellow. When you talk things over with Santa Claus, don't you forget "Mother." It doesn't have to be much —but just so she isn't forgotten.

Old Josh Simpson says the other fellows can eat turkey for Christmas if they want to—that so far as he's concerned he'll take " 'Possum, sweet pertaters and hoe cake for hisn."

Christmas week will be a mighty good time for you and your neighbors to get together and form a school district "Farm Club." Send in to this paper for a suitable Constitution and By-Laws. The time is here to get busy. Let's let the farmers of Missouri set the pace for the Nation.

The dry goods box whittlers and "long green squad" down at old "Hez" Brown's store are mightily "het up". One bunch headed by "Jep" Thompson are for a big Navy—but old "Chouce" Baker says, "It would just be wastin' money—cause I can take one of them submarine things and blow the stuffin' outen more battleships after supper than you can build in two years." The only thing "Jep" can say to refute this argument is, "Why you ain't got sense enuf to run a manure spreader —and if somebody told you there was a bottle of "pizen" floatin' around on the ocean somewhere, you'd go chasin' off after it and fergit all about the battleships." Then "Chouce" comes back and calls him a "liar."

Once more memory carries me back to when I was a boy on the farm at Christmas time. Once more I lay awake at night under the puffy old feather bed wondering what Santa Claus is going to bring me and speculating how his fleet-footed reindeer will manage to get around to all the little boys and girls that live in the World—and as I think back to those blessed old days I dare say there was more thankfulness in my heart for the little bag of candy and peanuts and possibly a french harp or jumping jack which I usually found in the old cotton sock than leaps up in the breasts of the pampered rich who have usually been indulged from cradlehood until there are few things new under the sun.

The old Dugas House, Atlanta, Ga., 101 years old. It is of Southern Yellow Pine construction throughout, and in a remarkable state of preservation today.

In Planning Your Building

not only the **Form** of the structure, but the **Material** to be used, should be given careful consideration.

Economical and satisfactory building, from a chicken coop to a new home, means the use of material that is workable, durable, strong, capable of giving maximum service under hard usage.

No other moderate priced material on the market today posesses the qualities of Strength, Rigidity, Durability and Workability to the degree found in

Southern Yellow Pine

"The Wood of Service"

That has been proved by Government test. So adaptable is it to every building need, inside the home and out, that more than 36 per cent of all the lumber used throughout the country is Southern Yellow Pine. Architects and Engineers everywhere universally specify it for hard, exacting service.

Whatever your building or repair needs, you will find honest, dependable Southern Yellow Pine fulfills every requirement. And you will find Southern Yellow Pine available everywhere, at prices far below any other structural material of anything like its high quality. It is inexpensive because it is plentiful.

Trust to the judgement of the leading architects and structural engineers—use Southern Yellow Pine for service and economy, for large needs or small.

If you have special building problems, we will gladly help you. Send for our **Free** plans for Houses, Barns and Miscellaneous Farm Structures, The Silo Book, etc.—fill out the attached coupon **Today.**

The Wheat Yield Tells the Story
of Western Canada's Rapid Progress

160 ACRE FARMS IN WESTERN CANADA FREE

The heavy crops in Western Canada have caused new records to be made in the handling of grains by railroads. For while the movement of these heavy shipments has been wonderfully rapid, the resources of the different roads, despite enlarged equipments and increased facilities, have been strained as never before, and previous records have thus been broken in all directions.
The largest Canadian wheat shipments through New York ever known are reported for the period up to October 15th,
upwards of four and a quarter million bushels being exported in less than six weeks,
and this was but the overflow of shipments to Montreal, through which point shipments were much larger than to New York.
Yields as high as 60 bushels of wheat per acre are reported from all parts of the country; while yields of 45 bushels per acre are common.
Thousands of American farmers have taken part in this wonderful production. Land prices are still low and free homestead lands are easily secured in good localities, convenient to churches, schools, markets, railways, etc.
There is no war tax on land and no conscription.

The Plunderer

By ROY NORTON

Author of "The Garden of Fate"

(Continued from last issue)

Once, in the night, they were awakened by the sounds of the men returning, as they discussed their situation and interjected copious curses for the instruments of the tragedy. Once again, later, Dick was awakened by a series of blasts, and turned restlessly in his bed, struck a match, and looked at his watch, wondering if it had all been a dream, and the morning shots of the Rattler had aroused him. It was but three o'clock, and he returned to his troubled sleep thinking that he must have been mistaken. Barely half-awake, he heard Bill climb out of his bed and don his clothing, the whistle pulled by the new hand, and the clang of hammer on steel in the blacksmith's shop. Then with a start, he was aroused from the dreamless slumber of the utterly exhausted by a heavy hand laid on his shoulder and a heavy voice: "Wake up, Dick! Wake up, boy! They've got us."

He sat up, rubbing his eyes and fumbling with the cordings of his pajamas. Bill was sitting on the edge of his bed, scowling and angry.

"Got us? Got us?" Dick repeated vaguely.

"Yes. Dynamited the Peltons, and I'm afraid that ain't all. We'll have to go up the pipe line to find out."

Dick rolled out and jumped for his clothing. He did not take time to follow his partner's kindly suggestion that he had better go to the mess-house and get the "cokie" to give him a cup of hot coffee. He was too much upset by the disaster, and walked rapidly over the trail. Not a man was in sight around the works and as he passed the smith's door, he saw that Smuts, too, had gone, without taking time to don his cap or doff his apron. The whole force appeared to have collected around the power-house at the foot of the hill, which was around a bend and shut off from view of the Cross. A jagged rent, scattered stone and mortar, and a tangle of twisted steel told the story; but that was not the most alarming damage he had to fear, for the heavy steel pipe, where it entered the plant, was twisted loose, gaping and dry.

He scrambled up the hill, seizing the manzanita brush here and there to drag himself up faster, and gained the brow where the pipe made its last abrupt descent. Far ahead, and walking sturdily, he recognized the stalwart figure of his partner, and knew that Bill was suffering the same anxiety. He ran when the ascent was less steep, and shouted to the grizzled miner ahead, who turned and waited for him.

"I'm afraid of it," Bill called as he approached; and Dick, breathless, made no reply, but hurried ahead with him to the reservoir. In all the journey, which seemed unduly long and hot that morning, they said nothing. Once, as they passed the familiar scene of his tryst with Miss Presby, now ages past, Dick bit his lips, and suppressed a moan like that of a hurt animal. Bitterly he thought that now she was more unattainable, and his dreams more idle than ever they had been. And the first sight of the reservoir confirmed it.

To a large extent, the reservoir of the Cross was artificial. It had been constructed by throwing a deep stone and concrete dam across a narrow canon through which there percolated, in summer, a small stream. Its cubic capacity was such, however, that when this reservoir was filled by spring freshets it contained water enough to run the full season round if sparingly used; and it was on this alone that the mill depended for its power, and the mine for its lights and train service, from hoist to breakers.

Where had stood the dam, gray with age and moss-covered, holding in check its tiny lake, was now nothing but ruins. The shots had been placed in the lower point, which was fifty feet down and conical as it struck and rested on the mother rock. Whoever had placed the charges knew well the explosive directions of his powder, and his work had been disastrously effective.

The whole lower part of the dam was out, and through it, in the night, had rushed the deluge of water so vital to the Croix d'Or. Small trees that had grown up since the dam had been built were uprooted in the bed of the canon, and great bowlders pulled from their sockets and sent resistlessly downward. Where, the day before, had been grassy beds and heavy growths of ferns, was now but a naked bed, stripped to the rock, down which flowed a small stream oozing from what had been the reservoir.

The partners stood, as if paralyzed, on the edge of the gulch, and looked down. The catastrophe, coming on top of all that had gone before, was a death blow, stupefying, stupendous, and hopelessly irremediable.

"Well, you were right," Dick said despairingly. "They've got us at last!"

Bill nodded, without shifting his eyes from the ruin below. They stood for another minute before scrambling down the canon's steep side to inspect more closely the way the vandalism had been effected. Slipping down the muddy bank, heedless of their clothing or bruised hands, they clambered over the broken pieces of wall, and looked upward through the great hole and into the daylight beyond. The blow was too great to permit of mere anger. It was disaster supreme, and they could find no words in that time of despondency.

"I'll give a hundred dollars toward a reward for the man who did that," shouted a voice, hoarse with indignation, above them; and they looked up to see the smith on the bank, shaking his smudged and clenched fist in the air.

"And I'll take a hundred more," growled one of the drill runners in the augmenting group behind him.

And then, as if the blow had fallen equally on all, the men of the Cross stormed and raved, and clambered over the ruins and anathematized their unknown enemy; all but one known as Jack Rogers, the boss millman, who silently, as if his business had rendered him mute as well as deaf, stood looking up and down the gulch. While the others continued their inspection of the damage, he drifted farther and farther away, intent on the ground about him, and the edge of the stream. Suddenly he stooped over and picked up something water-stained and white. He came back toward them.

"Whoever did the one job," he said tersely, "did both. Probably one man. Set the fuses at the power-house, then came on here and set these. Then he must have got away by going to the eastward."

"For heaven's sake, how do you figure that out?" Dick asked eagerly, while the others gathered closer around, with grim, inquiring faces, and leaned corded necks forward to catch the millman's words.

"I found a piece of fuse down at the power plant," he said. "See, here it is. It's a good long one. The fellow that did the job knew just how long it would take him to walk here; and he knew fuse, and he knew dynamite. The proof that he did it that way is shown by this short piece of fuse I found down there at the edge of the wash. He cut the fuse short when he shot the dam. He wanted the whole thing, both places, to go up at once. Now it's plain as a Digger Indian's trail that he didn't intend to go back the way he came, so he must have gone eastward. And if he went that way, it shows he didn't intend to hit it back toward Goldpan, but to keep on goin' over the ridge cut-off till he hit the railroad."

Dick was astonished at the persistent reasoning of the man whom hitherto he had regarded as a singularly taciturn old worker, wise in milling and nothing more.

"Now, if there's any of you boys here that know trails," he said, "come along with me, and we'll section the hillside up there and pick it up. If you don't, stay here, because I can get it in time, and don't want no one tramplin' over the ground. I was—a scout for five years, and—well, I worked in the Geronimo raid."

Dick and Bill looked at him with a new admiration, marveling that the man had never before betrayed that much of his variegated and hard career.

"You're right! I believe you're right," the superintendent exclaimed. "I can help you. So can Dick. We've lived where it came in handy sometimes."

But two other men joined them, one a white-headed old miner called Chloride and the other a stoker named Sinclair who had been at the Cross for but a few weeks, and admitted that he had been a packer in Arizona.

Slowly the men formed into a long line, and began working toward one another, examining the ground in a belt twenty feet wide and covering the upper eastward edge of the canon. Each had his own method of trailing. The white-headed man stooped over and passed slowly from side to side. Bill walked with slow deliberation, stopping every three or four feet and scanning the ground around him with his brilliant, keen eyes. The stoker worked like a pointer dog, methodically, and examining each bush clump for broken twigs.

But it was Rogers the millman, whose method was more like Bill's, who gave the gathering call. On a patch of earth, close by the side of the rampart and where the moisture had percolated sufficiently to soften the ground, was the plain imprint of a man's foot, shod in miner's brogans, and half-soled. Nor was that all. The half-soling had evidently been home work, and the supply of pegs had been exhausted. In lieu of them, three square-headed hobnails had been driven into the center of the seam holding the patch of leather to the under part of the instep, or palm of the foot. They were off like a pack of bloodhounds, with the old millman in the lead.

Dick started to follow, and then paused. He saw that Bill was standing aside, as if hesitating what to do.

"Bill, old partner," he said wearily, "if anything can be found they can find it. I think you and I had better go back and try to think some way out of this—try to see some opening. It looks pretty black."

The big fellow took four or five of his long, swinging steps, and threw an arm over the younger man's shoulder.

"Boy," he said, "they're a-givin' us a right fast run for our money; but we ain't whipped yet—not by a long way! And if they do, well, it's a mighty big world, with mighty big mountains, and we'll strike it yet; but they haven't cleaned us out of the Cross, and can't as long as you and me are both kickin.' They've got poor old Bells. They've tried to hand us a strike. They've blown our reservoir so's we can't work the mill until another spring passes over; and yet we're still here, and the Croix d'Or is still there, off under the peak that's holdin' it down."

He waved his arm above in a broad gesture, and Dick took heart as they turned back toward the mine, calculating whether they could find a means of opening it underground to pay; whether they would need as many men as they had, and other troublesome details.

CHAPTER XIII

THE DYNAMITER

The men of the Croix d'Or slowly made their way upward toward the higher crest of the range, spread out in an impatient fan whose narrow point was made up of the three experienced men. At times the trail was almost lost in the carpet of pine needles and heavy growths of mountain grass, and again it would show plainly over long stretches where the earth was exposed. It dipped down over a crest and sought a hollow in which ran a mountain stream, spread out over a rocky bed and running swiftly. At its bank they paused. It was plain that their man had taken to the water to retard pursuit, if such came. The millman threw up his hand and called the others around him.

"Before we go any farther," he said, "Let's find out how many shooting irons are in this crowd. We may need 'em."

The men looked blankly at one another, expressing by their actions the fact that in all the party there was not one who possessed a weapon.

"Then it seems to me the best thing to do is for one man to go back to the mine and get some," said Rogers, assuming leadership. "Who ever goes will find my gun hanging up at the head of my bunk in a holster. Bring that and the belt. There's cartridges in it."

One after another told where a weapon might be found, and two men volunteered to return for them. It was agreed that the others were to keep on and that after leaving the stream

men were to be posted at intervals to guide the messengers as they came up. Rogers proved something of a general in the disposition of his little army, and then, with Sinclair on one bank of the stream and Chloride on the other, he plunged into the water and began an up-stream course.

"It stands to reason," he argued "that our man didn't go down stream unless it was for a blind. He wouldn't double back because it would bring him out almost where he started. He will keep on up this way until she gets too small to travel in and then will hit off somewhere else. You other fellers keep behind."

They began a slow, painstaking course up the stream and began to fear they had been mistaken in their surmise, when Sinclair gave a shout. He had found the trail again, a telltale footprint with the patched sole. It broke upward on the other side of the canon, and now men were posted within shouting distance of one another and left behind to notify the two men bringing weapons which way to go. Across spots where the trail was difficult or entirely lost, and still higher until the timber line was passed and bare gray rocks were everywhere, the man-hunters made their way, and another watchman was left on the highest point. Down the other side and into the timber line again, directed only by a broken twig, a freshly turned bowlder, or now and then a faint suggestion of a footprint, they plunged as rapidly as they could and then through tangled brush until suddenly they picked up the footprints again, and now these indicated that the quarry had felt himself secure against pursuit and made no further attempt at concealment.

"He is heading out to the east, just as you said he would," the smith declared, as he sat down with the others to await the coming of the messengers. They were certain now that henceforth they would travel rapidly. They talked in low, angry voices among themselves, while Rogers, silent and grim, sat quietly on a bowlder and smoked. A shout from the hilltop attracted their attention and they looked up to see a group beginning to descend. The men with guns had returned and the outposts doubled back on themselves as they came, adding a man at intervals, until they joined those waiting for them. Without delay the men strung out in single file along the path, with the old millman in the lead. For the most part they went as quietly as would Indians on the war-path, loping along now and then down declivities, or panting upward when the trail climbed to higher altitudes. There was no doubt at all that the man who had dynamited the dam was certain of his having evaded all followers, and indeed he would have done so with men less trained and astute.

"Does any one know this country here?" demanded Rogers, suddenly halting his little band.

"I do," declared one of the drill runners. "I worked over here on this side one time about two years ago. Why?"

"Well, where does this trail go?"

"To an old logging camp, first, then from there there is a road leading over to Malapi."

Rogers lowered his hand from his ear and looked thoughtful for a moment.

"Many men at the camp?"

"No, I think it's been abandoned for two or three years," replied the drill runner. Rogers slapped his hand on his leg, and seemed confident again.

"Then that's where we'll find him. In that old, abandoned camp," he exclaimed. "It's a ten-to-one bet that he got some supplies up there some time within the last few days, when he made up his mind to do this job, and that he plans to lay quiet there until it is safe for him to get out of the country."

The others nodded their heads sagely.

"If you're sure of that," the drill runner said, "the best thing to do is for us to leave the trail over here a ways and come up to the old camp from behind it. He might be on the watch for this trail."

"Good again!" asserted the millman. "Here, you take the lead now and we'll follow."

For another hour they plugged along the trail with an increasing alertness, and wondering how soon the drill runner would turn off. At last he looked back and gestured to them. They understood. He slipped off the trail into the brush and began going slowly. Once he stopped to whisper to them to be cautious, inasmuch as within a few hundred yards they would reach their goal. Now they began to exercise the utmost caution of movement, spreading out according to individual judgment to avoid windfalls and thickets. Again the lead man stopped and signaled them. He beckoned with his arm, and they closed up and peered where he indicated.

Out in the center of a clearing stood a big rambling structure that had done service and been abandoned. A slow wisp of smoke, gray and thin, floated upward from the rough chimney, a part of whose top rocks had been dislodged by winter storms. They dropped to the ground and held a whispered consultation. They argued heatedly over the best course to pursue. The millman favored surrounding the cabin, and then permitting him with two others to advance bodly to the door and endeavor to capture their man.

The packer, Sinclair, suggested another course, which was nothing less valorous than a straight rush for the doors and windows; but Chloride fought that plan.

"It ain't that I'm afraid to take my chances," he declared; "but if we do that, some of us, with such a crowd, is sure to get shot. We don't want to lose no lives on a skunk of a dynamiter like this feller must be. I'm for surroundin' the house, then callin' him out. If he's an honest man, he'll come. If he ain't, he'll fight. Then we'll get him in the long run if we have to fire the cabin tonight."

"And maybe burn a couple of million dollars worth of timber with it at the same time," growled the drill runner. "That's a fine idea! I'm for Jack's plan. First, line out around the cabin, out of sight of course, then two men walk up and get him. I'm one of 'em."

"And I the other," declared Rogers. "Let's lose no time."

Silently, as before, the party spread out until it had completed the ring around the cabin and then, when all was in readiness, the millman and the runner, with pistols loosened, stepped out into the open and walked around to the door. There was a moment's tensity as they made that march, neither they nor the watchers knowing when a shot might sound and bring one of them to the ground. The runner rapped on the door, insistently. It creaked and gave back a sodden, hollow sound, but at first there was no response. He rapped again, and at the same time tried to open it; but it was barred. A voice from inside called, "Hello! What do you want out there?"

"Want to see you," the runner answered. "Open the door, can't you?"

There was an instant's hesitation and then again the voice, "Well, what do you want? Who are you?"

"Two men that ain't familiar with these parts," was the wary reply of the runner. "Want to talk it over with you."

There was the creaking of a bar, and the door was opened cautiously. One eye applied to a crack scanned the runner, who stood there alert. Rogers was out of sight Apparently the man in the cabin did not recognize the runner, for now he flung the door wide and stepped out. As he did so he saw the millman, whom he recognized, and swiftly pulled a gun and shot at him. Even as he did so the younger man leaped upon him, caught his wrist and wrenched the weapon from his hand. He did the unexpected thing. Instead of fighting, or attempting to regain the cabin, he deftly threw out a foot, tripped the runner against Rogers, leaped over both as they fell, and dashed headlong for the forest. Suddenly, as he gained the edge, several shots cracked viciously, but none of them seemed to have taken effect. He snarled loudly with excitement and plunged into the edge of the timber. Quite as quickly as he gained it a man arose straight in his path, leaped forward, caught him around the waist, and brought him to the ground. Men came rushing forward, almost falling over one another, but arrived too late to assist in the capture. Lying under and pinned to the earth by the huge blacksmith, struggling for release, and cursing between shut teeth, was the man who had been the watchman at the Croix d'Or when its new proprietor arrived, the man Wolff, whose past had been exposed by The Lily in the presence of some of those who were now his captors.

"Might have gussed it," growled the smith. "It's like him, anyhow."

Two others reached over and assisted him. They caught Wolff by his arms and lifted him to his feet, where they held him. Another man ran his hand over his clothes and took out a big hunting knife, sheathed. A further search revealed nothing save a small sum of money and a few dynamite caps. The prisoner attempted to brazen it out.

"What do you mean by this, anyhow?" he demanded. "Bein' held up am I?"

No one replied to him directly, but it was Rogers who said, "Lift his feet up there until we get a look at the shoes. Unceremoniously they hoisted him clear of the ground, although in a sudden panic he kicked and struggled. There was no doubt of it. The shoes were identical with those worn by the man who had dynamited the reservoir dam. The hobnails had betrayed him. For the first time he seemed to lose courage and whined a protest.

"Where were you last night?" demanded the smith, frowning in his face.

"Right here in this cabin. Been here two days now."

They walked him between them back to the door and Chloride and Sinclair went in. They inspected it closely. They dropped to their knees and examined the deposit of dust. They walked over to the fireplace and inspected the ash surrounding the little blaze, which had been started less than an hour before, as far as they could decide. Below was a heap of mouldy ash that had been beaten down by winter snows and summer rains falling through the broken chimney. The others watched the two inquisitors curiously through the open door.

"If he has been here two days he has moved around the room scarcely at all," Sinclair declared, "because the dust isn't disturbed by more than one or two trails. And, what's more, that fire is the first one that has been built here in many a long month, and it wasn't started very long ago. It's too thin. He just got here! He's the man!"

The prisoner was ringed round by accusing, scowling eyes. He shoved a dry tongue out and wet his lips as if the nervous strain were beginning to tell. He started to speak, but apparently decided to say nothing and stood looking at the ground.

"Well," demanded Rogers, "what have you to say for yourself?" You've plainly lied about being here in the cabin. What did you do that for?"

"I didn't say that I was in the cabin. I slept outside," Wolff growled.

"Then take us to the place where you camped," suggested one of the drill runners. A chorus of approving shouts seconded his request; but Wolff began to appear more confused than ever and did not answer. He took refuge in a fierce burst of anger.

"What do you fellows mean, anyhow?" he demanded. "I ain't done nothin.' What right have you to come up here and grab a man that way? Who are you lookin' for, anyhow?"

Prince Albert puts the whole smoke world at ease!

Gets down to trick-taking on the first-few-fire-ups, extracting smiles of satisfaction and peaceful content where frowns once grew thick! For, men find a bunch of jimmy-pipe-joy and cigarette-makin's-happiness in Prince Albert! Because, the harder they smoke it, *the truer it proves!* The patented process fixes that—and *removes* bite and parch!

PRINCE ALBERT

the national joy smoke

certainly makes it worth your while to get pipe-broke or cigarette-broke! *It's so kindly to your tongue;* it has such a smokable-way-about-it!

Life's too short and time's too speedy to worry with the tobacco question. You get going down the trail for a supply of P. A. You'll locate it at any store that sells tobacco. It awaits your howdy in toppy red bags, 5c; tidy red tins, 10c; handsome pound and half-pound tin humidors and in that joy'us crystal-glass pound humidor with sponge-moistener top that keeps P. A. fit-like-a-thoroughbred!

THE TOUR OF A SMILE

My Papa smiled this morning when
He came downstairs, you see,
At Mamma; and when he smiled then
She turned and smiled at me;
And when she smiled at me I went
And smiled at Mary Ann
Out in the kitchen, and she lent
It to the hired man.

So then he smiled at some one who
He saw when going by
Who also smiled and ere he knew
Had twinkles in his eyes;
So he went to his office then
And smiled right at his clerk,
Who put some more ink on his pen
And smiled back from his work.

So when his clerk went home he smiled
Right at his wife, and she
Smiled over at their little child
As happy as could be;
And then their little child, she took
The smile to school, and when
She smiled at Teacher from her book
Teacher smiled back again.

And then the teacher passed one on
To little James McBride,
Who couldn't get his lessons done
No matter how he tried;
And Jamesy took it home and told
How Teacher smiled at him
When he was tired, and didn't scold,
But said: "Don't worry, Jim!"

And when I happened to be there
That very night to play
His mother had a smile to spare
Which came across my way;
And then I took it after awhile
Back home, and Mamma said:
"Here is that very selfsame smile
Come back with us to bed!"

—Woman's Home Companion.

CHRISTMAS GIVING

"Christmas that comes every day of the year" enthusiastically exclaimed one dear little house-mother, in her unbounded joy over her utilitarian tokens of the day from loving friends. Her gifts were to renew this pleasure every day in the year. They were to be such ready assistance in her daily domestic work and would help solve shorter and better methods with quicker results.

Gifts, like friendship, should stand for usefulness and goodwill, thus in selecting these joy reminders let them be of such a nature that its pleasure will outlive the passing hour.

If possible, let the article in its fitting qualities, suggest to the recipient the personal touch—in a gift that conveys their individual taste or habits—one that reaches the deepest expression of approval.

To a reader or a young person in whom we wish to cultivate the habit and pleasure of reading, a book would be uppermost in our minds as the one article to express our appreciation of their distinct personality.

However, try as we may there are many whose natures do not call out any special power of selection and yet we wish to cater to the general goodwill in some material form. We wander aimlessly through the shops and streets hoping for some suggestion, after a time select some token whole value is in its outward appearance, without any relation whatever to the individual's taste, thus we are often guilty of burdening our friends with gifts that to us suggest utter folly to purchase or produce, and yet it may be a conceit that will please the fancy for a short time.

We recall a minister who felt that a gift at this season should not be the necessary articles of daily life, but rather an indulgence in a thing of beauty and in consequence the daughter received one Christmas, when she had been making every effort to obtain a much needed winter coat, a pair of toilet bottles, beautiful in themselves but the lack of judgment and appreciation of things useful brought only regrets rather than the anticipated pleasure.

To those who can not always give either the useful or the beautiful, there does remain the joys that are ours to give when we will stop and think that—

"The thing that goes the farthest,
Toward making life worth while,
That costs the least and does the most
Is just a pleasant smile."

Friendship's Garden

Have you planted your flower garden? If not, it is high time that you get your seed in before the ground freezes; these sleeping seeds, buds and blossoms will patiently await the awaking of spring sunshine and be ready to start long before one can get the soil into proper condition for early sowing, besides many hardy flowers will thus give us blooms the first season, otherwise we must wait for the second summer to get them.

Larkspurs, verbenas, poppies, foxgloves and many other familiar old flowers that we love because around our childhood days there centers the memory of our mother as she tended and loved these same good friends.

How many of the field flowers that greet you on your rambles, do you know? It is with regret that we confess to very few that we can familiarlly call by name—but how fondly these few acquaitances are cherished.

This past summer it was our good fortune to find two new to us wayside flowers, one a beautiful blue that closely resembles the larkspur and bloomed from early summer 'till late fall. I have since learned that it is Venus Looking Glass. The other had beautiful golden bells, like a buttercup, it flowers in August but is most queenly in her golden glow. The seeds of these two have been carefully saved and sown in one corner of Friendship's Garden.

Perhaps we have not told you about this garden at Rivercene Farm, wherein are many bulbs, flowers, shrubs and trees, the gifts of dear friends—many of whom have passed to the other side. Each season as the flowers open their lovely blossoms we renew our friendship with the donor of that special plant.

Some are the same shrubs that our mother loved and we live again with her in the blessoms of "burning bush" of moses, lilacs, snowballs and all the early flowers.

In the middle of this garden grows a stately Ginkgo tree, which to us, seems a fitting memorial to a young brother who passed away in early manhood, for his hand had planted and trained this tree.

All of this may suggest sadness and living in the past, but in memory's garden sweetness and sadness intermingle so harmoniously that only the flower of love clings to our souls.

The border is always aglow with blossoms, the early jonquils and narcissus have hardly lost their freshness ere the glorious iris demands the way and for weeks keep all filled with admiration of their beauty, then all at once the way seems in a blaze of brilliancy as the poppies make their bows, a little later comes an acknowledged belle and the flox with her calm dignity holds the border for the rest of the summer, only here and there a holyhock dare assert its rights and followed by that frost daring cosmos.

How many of our little readers have a corner all their own in mother's garden, where they can plant and gather at their own sweet will? It would be a very bright Christmas if you would write to this department during the holidays telling how much you love flowers and perhaps my nameless wild flower is a friend of yours and you can tell me what to call her next summer when she comes again; if you have saved seeds we may be able to exchange some and then you would let me have a tiny little spot in your friendship's garden and you shall have one in return at Rivercene.

Just the Book for Christmas

Everybody's laughing at "Reuben: His Book," by Hon. Morton H. Pemberton, "Reuben" humorist of Chautauqua and Lyceum companies. A handsomely bound volume of 300 pages, containing Reuben's humorous lectures and all of Reuben's European travels.

The following are some of the many endorsements:

"I read "Reuben: His Book" with intense delight. I have not laughed so much since I first read Mark Twain."—Champ Clark.

"I know of no better substitute for a trip to Europe than "Reuben: His Book."—Herbert S. Hadley, Ex-Governor of Missouri.

"It is indeed a relish, and deserves a place in any library."—Elliott W. Major, Governor of Missouri.

"Keep Reuben busy."—Robert J. Burdette.

"Those who have read "Reuben" will wish to read more from his graceful pen. He has a most attractive style."—Walter Williams, Dean, School of Journalism, University of Missouri.

"Reuben is deservedly called another Mark Twain."—Williamsburg, Kansas, Star.

For sale only by the author. 3rd edition, 17,000. Price, $1 postpaid. Address, Morton H. Pemberton, Jr., Columbia, Mo.—Adv.

A Splendid Christmas Gift: The above picture represents a beautiful enlarged photograph, 13 by 17 inches in size which would ordinarily cost you three or four dollars if purchased through the usual channels. For the next ten days only we offer one of these splendid photographs to any reader who sends us a check or money order for $1.65, which will also renew your subscription for three years. You couldn't find a more suitable Christmas present to give to your loved ones than one of these beautiful enlarged pictures of some one who is dear to them. Wrap your photograph carefully and write your name and address on the back. You will be surprised at the beauty and elegance of this work. **The Missouri Farmer, Columbia, Mo.**

LYON'S PRACTICAL FARM PAPERS

The morning of November 27 was as fine as you ever saw in October, mercury at 60 degrees, clear and bright, and at 6 p. m. the thermometer said 36, with a hard snow storm. This morning, December 1, there is two inches of snow on the ground, mercury at 30 degrees, with promise of heavy snow before night.

We hauled two loads of hogs yesterday at $6.25 per cwt., on a city market of $6.85, and the boys said the shipper would get more than a carload at that price.

Corn is selling at 55 cents per bushel, or rather it is not selling, as farmers think it will be higher and are storing it. We may sell 500 bushels or so, but I have been reading all crop reports, especially those from Nebraska, Northern Kansas, Western Iowa, the Dakotas and Minnesota, and from what is said about the large percetnage of soft, unmerchantable corn in these states, I am inclined to look for higher corn prices before June.

The weather has been so fine and pastures so good that but little roughage has been fed, but still hay goes up in price, owing to the war, it is said.

Noting market changes, I see that both clover and timothy seed are down, near $1 per bushel lower than a month ago.

Several years' experience, tells me that early January is the best time to buy clover seed, as the price nearly always goes up a dollar to two dollars per bushel about February 1, when seeding begins.

December 4, 4 p. m. Our big snow did not come and we have had two beautiful days, which have been spent in getting in more corn and fodder.

The wood and coal were in several weeks ago, and three more days will see all the corn in the cribs, the best crop ever made on the farm.

Tobacco stripping is away behind and the warehouses will not have enough for a sale on the usual date of opening, December 7.

Personally, we are fairly well along having an early crop, and having gon to work on it as soon as possible.

Black leg has appeared among cattle some thirty miles east and is proving very fatal, but I hear that the outbreak is now under control.

C. D. Lyon.

NATIONAL EGG LAYING CONTEST AT MOUNTAIN GROVE

In order to succeed in breeding any animal, it is necessary for the breeder to have an ideal and his efforts must be for the production of that ideal.

Different breeders have different ideals. One man strives to produce the high scoring prize winning hen, paying little or no attention to egg production, while another tries to produce the high laying hen and ignores fancy or show qualities. All will agree, however, that the highest ideal is the hen which scores high, lays a great many eggs, and lives a long time.

Of the many lessons learned in the egg laying contests, one which stands out most prominently is that color has nothing to do with egg production and that high scoring birds are often high producers.

In order to get an idea of the standing in the show room of the exhibitors who have had high producing hens in the contest at Mountain Grove, a letter was sent to each contestant who has had hens in the contests which produced 200 eggs or over.

Sixty contestants were heard from, giving the prize winning records while their hens were making the high record at Mountain Grove. One thousand eight hundred twenty-three prizes were won by these contestants which were as follows: 653 firsts, 477 seconds, 243 thirds, 198 fourths, 92 fifths, 142 specials, 18 sweepstakes.

Eight contestants had not entered any shows, therefore had won no prizes.

Many of the hens which won in the egg laying contest won prizes before and after the contest. These prizes were won in San Francisco, New York and Chicago shows, ten State Shows, eighteen State Fairs, and many district, county and local poultry shows. This would indicate that many breeders are reaching the high ideal.

These records together with observations made during the contests indicate that color of bird, color of eye, kind of comb, etc., have nothing whatever to do with egg production, and that the fine show bird which scores high is just as sure to be a good egg producer as the low scoring bird, and as the bird which scores high usually carries herself like she thought "life is worth living. She has high vitality which indicates long life.

Summarizing the fancy and utility question, we find some contestants who win in egg production, but not in the show room.. Others win in the show room but not in egg production. While others win in both shows and egg production. This leads us to believe that it is possible to go to either extreme by breeding, or to combine the two.

The man who has never had his birds in a show has no right to claim they are high scoring birds, and the man who has never tested his birds for egg production should not boast of high producers, but the man who can win in both deserves the highest honors.

C. T. Patterson,
Missouri State Poultry Experiment Station, Mountain Grove.

For Fattening Chickens

The following ration has been recommended by the poultry husbandman of the Nebraska College of Agriculture as being most economical for this state and giving satisfactory results in fattening chickens: 60 per cent corn meal, 40 per cent low grade flour, 20 per cent wheat middlings. Mix with skim milk to the consistency of a batter, and feed morning and night. Starve the birds 12 hours previous to their first feeding. This will sharpen their appetite. Fatten for two weeks in a small pen or crate until ready for killing. This will deprive the fowls of exercise, and the muscles will become soft. Fatty tissue will be taken on between muscle fibres, which will greatly aid in the cooking process.

Don't kill the bird when the crop is full. Starve for 24 hours and provide all the water they will drink. If the chicken is to be roasted, remove the crop either with the viscera or by making an incision next to the spinal column where it will not show when the bird is served. The cords or tendons of the thigh may be easily removed by partly severing the shank at the hock joint. Then, after locating the cords by making a lengthwise incision in the scaly portion of the leg, fasten the leg securely and pull steadily until the cords tear loose.

Some high scoring, high laying hens and the yards where they made the records at the Missouri State Poultry Experiment Station, Mountain Grove, Mo.
No. 1. Contest yards showing relation of sunshine, shade and green food.
No. 2. Highest laying pen of White Plymouth Rocks in the Fourth Contest.
No. 3. Highest laying pen of White Orpingtons in the Fourth Contest.

Alfalfa Troubles.

A season like this one has been is one of the worst on alfalfa. While it may not drown out on many occasions the wet weather is so favorable to the growth of foxtail and crab grass that these grasses crowd out the alfalfa. The first best treatment that I know of is as soon as a crop is cut give the field a thorough renovating, and the best tool that I know of for the purpose is a spring-tooth harrow with a special tooth made by The Bucher & Gibbs Plow Co., of Canton, Ohio. This harrow is good for so many other purposes also that it is a good tool to have on the farm.

Renovating may be done after the hay is taken off after each cutting, but it is sometimes not best to use after a late fall cutting.

About eight Pettis County farmers have secured these harrows and all are loud in praise of the work they do.

No sharp-edged tool should be used in renovating alfalfa.

Sam Jordan.

Chevrolet

Say CHEV-RO-LAY

CONCEIVED by W. C. Durant, the man who developed five well-known cars and organized the General Motors Co., and A. B. C. Hardy, a pioneer builder.

POWERED by Arthur Mason, the originator of valve-in-head motors and the father of the new detachable head Chevrolet valve-in-head type---the last word in Power, Performance, Endurance and Economy.

PRODUCED by Russell E. Gardner and Sons, whose business principles are gauge and guarantee of efficiency and service.

DISTRIBUTED by the Chevrolet Motor Car Company of St. Louis, John Brodhead, Manager.

Dowden & Partridge, Maryville, Mo., February 11.

Brockman's Good Durocs

One of the very best herds of Durocs owned in Missouri will be found on the farm of A. C. Brockman, Centralia, Mo. Mr. Brockman, who has been engaged in breeding Durocs for a number of years, has constantly endeavored to combine extreme size, bone, and prolificacy with quality. That he has succeeded there can be slight question. as his winnings at the State Fair testify, and further, the satisfaction that he has rendered his many customers is additional proof.

Mr. Brockman has used a number of choice boars on his sows, which represent largely the blood of old B. & C's Col. one of the acknowledged great sires of the breed. Just now Mr. Brockman is using an Illustrator boar, also a son of Top Inventor, and a splendid son of select Col. II. He is therefore in a position to furnish our readers with a variety of breeding. Besides a number of desirable spring boars, this herd offers an unusually attractive lot of gilts bred to farrow early next spring. These gilts are easily the best Mr. Brockman has ever offered and they are priced in keeping with the quality offered. When writing in regard to any of this stock kindly mention this paper.

Cooke & Son's Holsteins

S. W. Cooke & Sons, Maysville, Mo., report that their herd of Holsteins is in fine shape and add that they have a number of choice bull calves for sale. These calves are sired by one of the best bred bulls owned in Missouri and a number of them are out of A. R. O. dams. Our readers will find Messrs. Cooke to be thoroughly reliable in every way.

Hill Offers Duroc Gilts

R. L. Hill, Columbia, Mo., is offering five gilts, bred to farrow early next spring. Four of the gilts were sired by Col. Wonder IV, 3rd prize boar at Missouri State Fair, 1913. The fifth gilt was sired by Tatarrax Again. They are all bred to Merry Chief, the boar that headed the first prize herd in the Missouri Duroc Futurity. Merry Chief is by Red Chief, a popular Iowa sire. Red Chief is by the great Cherry Chief. Here is a chance for Missouri breeders to get some new blood. The gilts are being priced worth the money. Mention this paper.

The Williams Dispersion Sale

The dispersion sale of Poland Chinas held by W. E. Williams of Silex, Mo., November 18th, resulted in a general average of $31.04 on 72 head. With the closing out of this herd the state as well as the breed lost one of the choicest collections of Poland China breeding animals ever owned in Missouri.

Several years ago Mr. Williams, who is a banker in Silex, felt the necessity of outdoor exercise and he decided to enter the ranks of the Poland China breeders. Gifted with high ability as a judge of live stock, and backed with sufficient means, his early purchases were of a character that put his herd to the front at once. The sow selections represented superior animals that were bred deep in the most fashionable and proven bloodlines. But perhaps the success of this herd was due, more than any other factor, to the influence of the boar, Longfellow Sampson. This boar was purchased as a pig and was developed by Mr. Williams into a boar that was conceded by all to be one of the top herd headers of the state. That Longfellow Sampson was a breeder of first water ability, was attested to by the great lot of spring gilts that were sold on the above date. It is doubtful if a better lot has passed through any sale ring this year. The top was $120. That price being paid by W. H. Rough of Riverside, California, for No. 9. Mr. Rough also secured several other choice numbers.

One of the rare bargains of the year was secured by J. F. Richards & Son, Bevier, Mo., when they paid $100 for Longfellow Sampson.

Both Messrs. Richards and Mr. Williams are to be congratulated upon this transfer. The buyers should consider themselves fortunate to secure such a satisfactory successor to their former herd boar, Pawnee Price, and Mr. Williams should feel particularly pleased that his favorite boar goes to such a high class herd.

Among the heaviest buyers were, E. E. Marlow & Sons, Wellsville, Mo., H. O. Linhardt, Lohman, Mo., H. C. Carroll, Clarksville, Mo., J. M. Besterfelt, Bonne Terre, Mo., Guy Fisher, Frankfort, Mo., Geo. Alberts, Corso, Mo., A. L. Burke, Sweetwater, Tenn., and L. J. Long, Peru, Ind.

Col. R. L. Harriman did the selling and handled the sale in his usual high class manner.

Bruns & Sons' Jerseys

Wm. H. Bruns & Sons, Concordia, Mo., offer splendid values in Jersey bulls and heifers. Messrs. Bruns have built up a high class herd of producing Jerseys and are in a position to offer our readers some real bargains.

Duroc Herd Boar for Sale

The Buckeye Stock Farm, Olean, Mo., desires to sell the herd boar King Chieftain 145717 for the reason that a number of gilts by him are being retained, and the boar can no longer be used to advantage.

King Chieftain was farrowed February 10, 1913, and is sired by Crimson Col. I Am, Junior Champion at the American Royal in 1912. His dam is the great producing sow Belle of Chiefs 325048, a prize winning sow at the State Fair and the Royal in 1911 and 1912. Here is a splendid opportunity to buy a useful herd boar, bred as well as any, at a price decidedly attractive. Write at once if you want a bargain. Mention this paper.

R. L. Hill's Junior Champion Duroc Gilt. The above gilt is a litter mate to the boar, Merry Chief, referred to above

Powell & Son's Duroc Jerseys

E. P. Powell & Son, Maryville, Mo., who advertise Durocs in this paper, can furnish excellent spring boars and gilts of choice breeding and individuality at prices that should prove attractive to our readers. Messrs Powell are high class breeders in every way and we are glad to recommend them to our readers. Besides the above stock, a number of desirable gilts and sows, bred to farrow early next spring are in offer.

Clydesdale Horses, Jacks and Jennets

Clydesdale Stallions, Mares and Colts, with quality and breeding, for sale at lowest prices. We also breed Jacks and Jennets and sell them as low as the lowest.

HIGHVIEW FARM F. L. CROSBY, Prop., Mexico, Mo.

C. H. BROWN, - - BOLIVAR, MO.

Chester White Boars and Bred Gilts

H. Rauscher & Son, Kahoka, Mo., offer our readers exception values in Chester White breeding stock. For over 50 years the name of Rauscher has been linked with pure bred Chester White swine and today the name of Rauscher is a guarantee of quality and fair dealing. The young stuff now offered is bred along the best blood lines know to the breed, and it has been handled intelligently with a view to future usefulness in the hands of the buyer. We would suggest that any of our readers who are planning to purchase Chester White breeding stock get in communication with this firm. The prices are extremely reasonable.

Durocs With Unusual Size

J. E. McPherson, Columbia, Mo., is advertising a splendid lot of spring boars and gilts, the latter are offered either open or bred. The above stock is of early spring farrow and because of careful handling and feeding is presented to the buying public with a considerable more size than one usually finds. The blood lines offered are right in every way and the prices are extremely reasonable.

College of Agriculture Offers Livestock for Sale

A rare chance to secure pure bred livestock from the different herds maintained by the College of Agriculture is presented to our readers in the advertisement elsewhere in this paper.

Just now choice Poland China and Duroc boars and gilts, and Percheron mares are in offer. The prices on all this stock make them very attractive buys. Only a limited number are for sale and if you want livestock of proven merit, we would urge that you write at once. The pair of registered Percheron mares will make any one money. They are good individuals and are safe in foal to Honorable, one of the best Percheron stallions in Missouri.

Red Polled Cattle and Spotted Poland China Hogs

M. L. Snyder, Polo, Mo., is advertising a nice lot of young Red Polled bulls. Mr. Snyder has bred these cattle for years and he has at all times kept in mind the development of a useful type of cattle for the farmer. The milking qualities have been carefully developed as well as the fleshing qualities.

Spotted Poland China spring boars and gilts are also for sale at moderate prices.

Rockwood Farm Durocs

Rockwood Farm, Iberia, Mo., offers the readers of this paper some high class values in Duroc spring boars and gilts. The Rockwood herd was establishde by purchases from some of the leading herds in the country and the young stock now for sale carries an unusual amount of grand champion blood. The prices are very reasonable and satisfaction is guaranteed the purchaser.

Linhardt's Polands

One of the most attractive offers ever made our readers who are interested in Poland Chinas is made by H. O. Linhardt, Lohman, Mo. Mr. Linhardt has an exceptionally high class herd and he sells his stock at farmer's prices. The fact that breeding stock from this herd has been shipped to half the states in the Union should convince our readers that the Linhardt kind please.

Shropshire Ewes

C. W. Chandler, Kellerton, Iowa, is offering an attractive lot of Shropshire ewes bred to lamb in March and April, to the service of a son of Ludlow King (04699R) 234744, a sire of two state fair champions. Mr. Chandler also offers rams. Mention this paper when you write.

Milking Shorthorn Herd Bull

J. Al Slifer, Chilhowee, Mo., is advertising for sale the 5 year old Shorthorn bull, Clay Lord 343002. This bull was bred in New York state, and comes from a strain of Shorthorns long noted for their ability at the pail. If interested we would urge that you write at once.

Jersey Heifers for Sale

D. V. Vandiver, Columbia, Mo., is offering 10 Jersey heifers, 14 to 18 months old. The heifers are sired by Imm's Signal 110996, out of extra high grade Jersey cows. The above heifers are bred to Kinloch Granville Lad 91520, a grandson of Golden Fern's Lad. Eight three-year-old cows are also priced. This stock will be sold worth the money. Please mention this paper when you write.

DUROC JERSEYS

Durocs With Size and Bone

I am offering a choice lot of early spring pigs with unusual size, bone and quality. Bred right and priced right. Visitors welcome.

A. C. BROCKMAN, R. F. D. 2, Centralia, Mo.

Duroc Boars For Sale

Anything from a 50-lb. weanling to a 500-lb. herd and show boar. We offer some first-class herd header prospects. Good strong boned farmers stock boars. Also gilts. I also have one 16-months and one weanling Shorthorn bulls. Write me your wants. Will try to please you—the price will be right. Over forty old customers are buying here because both prices and stock have been right. Write today for that boar. I have got him. J. E. WELLER, FAUCETT, MO.

A. NO. 1 DUROC SPRING BOARS

I am offering a few extra choice spring boars sired by ILLUSTRATOR and out of TATTLETALE 39th, junior champion International 1912. A few by CRIMSON CHIEF AGAIN. Write or come.

Eighty miles north of St. Joseph, Mo.

Pure Bred Business Attractive

The young man who is hesitating about taking up the pure-bred live stock business may get inspiration by reading the following by Dean J. H. Skinner of the Indiana Experiment Station, one of our best authorities on this subject:

As the country develops and time goes on, the demand for pure-bred animals in this country should undoubtedly increase. New conditions will require the elimination of animals of inferior breeding and quality and necessitate better feeding and management. Even though our live stock population may not be destined to increase rapidly in the near future, the demand for more efficient animals in all parts of the country, due to a better appreciation of good stock, is bound to create a strong demand for purebred animals, not only for the establishment of new herds and flocks of breeding stock but to supply pure-bred males of superior quality for use in herds and flocks maintained primarily for the production of animals for the market.

The farmers in a vast territory south of the Ohio and east of the Mississippi River, a country which has many advantages in the way of cheap land, excellent forage and pasture crops and favorable climatic conditions, in which but little attention has been given to live stock are just beginning to awaken to the importance and possibility of live stock. True it is that this territory has its handicaps in the lack of live stock instinct and knowledge on the part of its farmers, the scrub and the cattle tick, but these will all be overcome once the people are thoroughly aroused to the advantages of good stock in the maintenance of crop yields and diversified farming. In this sunny south land today many pure-bred herds of cattle and hogs are being started and with better appreciation and improved conditions this number is bound to multiply rapidly, thus creating a market for breeding stock such as has not been known in this country in recent years. That this fact is recognized by various breed associations is shown by their support of Southern Fairs, Stock Shows and Public Sales.

Bridges Brothers' Big Bob. This great young boar will be strongly represented in the sale

The effect of the war is likely to result in a demand upon the herds and flocks of America to supply the breeding stock of South America and other foreign countries. It has taken a long time to establish the fact that we can and do breed just as good horses, cattle, sheep and hogs as our foreign cousins. Nevertheless, there can no longer be any doubt in regard to it.

As a result of the war, we will learn that we can breed and develop just as good Belgian and Percheron horses in America as were ever brought over the water and if all reports are true, it will not be surprising to find our studs of these horses called upon to restock Belgium and France, in addition to supplying a rapidly growing home demand for pure-bred draft horses of the highest type and quality. To offset this some think the use of the tractor, which is bound to increase, may seriously interfere with the production of draft horses. On the other hand it seems to the writer that the introduction of the tractor on our Corn Belt farms will more than likely increase the demand for pure-bred mares as it will take much of the slavish work off of these patient animals and make their use on the American farm more common since the possibility of operating the farm and at the same time successfully producing colts of superior weight and quality will be greatly increased.

Holsteins and Guernseys

Look up the advertisement of the Edgewater Stock Farm in which grade Holstein and Guernsey cows are offered. This farm has 125 head of these high grade dairy cows. The advertisement also states that they offer a few very choice registered heifers and bulls of the two breeds. Grade calves are priced $18 each. In writing please mention this paper.

Adenhill Duroc Sale

In a resent letter from R. L. Hill, he reports the following sales from his Adenhill herd of Durocs: Five big yearling gilts to S. R. Greer, White Hall Ranch, Louisiana. These gilts were sired by Col. Wonder II and Col. Wonder IV and were bred to Rexall Col. for spring farrow.

Kampschmidt & Shepherd, Columbia, Mo., secured two choice bred yearlings. Dr. H. C. Tuck, deputy state veterinarian, bought one yearling gilt and one spring gilt, and a boar. Dr. Tuck is establishing a herd in Southwest Missouri.

Mr. Hill now offers 12 bred sows and gilts of choice blood lines and nice individuality for sale at reasonable prices.

Bridges Bros.' Poland Sale

In a recent letter from Bridges Bros., Slater, Mo., they state that they are sold out of spring boars. They are now bending every effort toward getting their sale offering ready. This firm will offer a very superior lot of strictly big type Poland Chinas in their sale February 11th, and as most of the offering will be bred to Bridges Col. Bob, the boar shown herewith, the sale is bound to prove attractive. The writer regards this young boar as one of the most promising herd boars he has seen this year.

Taylor's Great Duroc Sale

The attention of our readers is directed to the advertisement, on this page, announcing that on Friday, January 21, Chas. L. Taylor, will hold his second annual bred sow sale. This sale promises to be one of the most attractive offerings ever cataloged in Missouri. In the first place, the Taylor herd has come to be recognized as one of the best collection of Durocs of the breed. This recognition has been earned by the actual performance of the herd. Since 1912 the blood of Col. Wonder, the champion senior herd boar, has figured in the list of awards at the State Fair. In 1913 he was made grand champion at that show, in 1914, a daughter of Col. Wonder, Belle of Missouri 3rd, was grand champion sow at the above show, and in 1915 another daughter, Col. Wonder's Dream, was made grand champion. This record alone is sufficient to establish Col. Wonder as a great sire, but when one reads the entire list of winnings of his get, there is little room for argument left. Backed up by a long line of champions, a champion himself, and a sire of champions, our readers can appreciate the value of this blood.

In the approaching sale, Mr. Taylor has selected 50 head of sows and gilts, every one of which represents in some way the blood of Col. Wonder. The offering will include three mature sows, twelve spring gilts and the balance will be spring, summer and fall yearlings. Few sales will offer as many yearlings.

To give our readers an idea of the quality of the offering, it will be well to note that the entire herd of show sows with the exception of the grand champion sow, are listed. Many very special attractions will be found, for instance, Col. Wonder's Dream II, a litter mate to the 1915 champion sow, is cataloged. She is by Col. Wonder, and is out of Nona Princess, by Prince Albert, second dam, by Defender, and third dam was Mc's Dream, grand champion sow at the International for two successive years.

From a breeder's standpoint, one of the most attractive sows is Miss Crimson Wonder, litter mate to Col. Wonder. This sow was 2nd in class at Sedalia in 1912 and 1913, and was only defeated by the sow that was made grand champion each year. Miss Crimson Wonder sells bred to Show Me, the junior champion boar at Sedalia and St. Louis in 1915. There is also a full sister to Show Me in the offering.. This young sow is easily one of the fanciest in the sale. Space prevents further details at this time, but we will have more to say in subsequent issues. A point to bear in mind is this, at the sale last year we know of several men who bought bred gilts, that later proved to be litter mates to champions and other prizewinners and the prices paid made them look mighty cheap. The same opportunity will obtain in this sale. Breeders, farmers, and beginners should write at once for the catalog. Address, Chas. L. Taylor, Box 6, Olean, Mo. Kindly mention this paper.

Announcing a Great Event

TAYLOR'S 2nd DUROC SOW SALE

To Be Held at

Olean, Mo., Friday, Jan. 21.

50 HEAD of COL. WONDER DUROCS

The Taylor Kind. 1st Prize, aged herd, at Sadalia and St. Louis, 1915. Two grand champions and a junior champion, all by Col. Wonder

I have selected for this event 50 head of bred sows and gilts, every one representing the blood of Col. Wonder, grand champion Missouri State Fair, 1913, and sire of the grand champion sow at the same fair in 1914 and again in 1915. No better blood exists than Col. Wonder breeding. Included in the sale are daughters and grand daughters of Col. Wonder, and sows bred to him.

SPECIAL ATTRACTIONS

As special attractions I am putting in my entire show herd of sows except the grand champion. There is a litter mate to the champion sow, and also a litter mate to Col. Wonder cataloged.

Remember the date and watch this paper for further announcement.

Getting Down to Business

That the great fight which The Missouri Farmer is making for a powerful state-wide organization of farmers is bearing fruit is evidenced by the hundreds of letters which are pouring into this office from every section of Missouri and we believe we are safe in saying that not less than a thousand school district Farm Clubs will have been formed and be in fighting trim before the end of January. Assuming that these clubs will have an average membership of twenty, it will mean that 20,000 determined Missouri farmers will have "shelled off their coats" in this great new movement which has for its object the compelling of a "square deal" for the farm from this time forward. But why should we be content with merely one thousand clubs? Why not make it 2500 and enlist not less than 50,000 farmers in this great crusade during the next 30 days? We are satisfied that there are this many districts in the state where all the movement lacks at this time is a little leadership on the part of two or three aggressive farmers—and here goes a personal appeal to every reader of this paper to get busy at once. Remember we will gladly supply you with a suitable Constitution and By-Laws and a complete program which will enable you and your neighbors to get down to business without waiting for outside assistance. We have already prepared a splendid discussion of the Land Bank Bill and a number of other great questions which we can supply and which will enable you to get to work without delay. The thing to do therefore is to call your neighbors together at the school house at once, perfect a Farm Club and name a good President and Secretary. Then get in touch with us immediately when we will gladly co-operate with you all along the line. As soon as a dozen or more Farm Clubs have been formed in your county, plans for a big county farmers mass meeting should be set in motion and at that time a County Farmers' Association should be formed and with this larger machinery the work should be pushed until the county has been organized from end to end.

This is the first time that a definite program for a powerful, state-wide farm organization has ever been submitted to the farmers of this state and it should therefore not be classed with the feeble and scattered efforts of this kind in the past. Unquestionably the hour for action has arrived—for present conditions are intolerable and if the Agriculture of the Nation is to be saved from the Packers' Combine, the gambling in grain futures and other deadening influences which, like some huge industrial Devil Fish are sucking out its very life blood at this time, farmers must shake off the indifference which has so long characterized them—and, standing shoulder to shoulder in every school district in the state, give battle to the industrial vampires who so gravely menace them at this time. Under this system, farm mortgages and land tenancy are increasing by leaps and bounds and the price of continued inactivity will be a condition little better than Agricultural bondage. The stakes we are playing for amount to untold millions of dollars. In this state alone farmers will have sacrificed not less than $15,000,000 on the price of cattle and hogs alone during the last year—and if we would escape from the payment of this tremendous tribute in the future, farmers must arise as one man and shake off the strangling monopolies which now grip at their throats. There is no other way out. At last we are face to face with a battle for the preservation of our farm homes—and upon the outcome of this issue depends the reward you will get for your future sweat and toil, whether you will be able to pay off your mortgage during your life-time, whether the children who come after you shall have a "square deal" as well as the future well-being of the millions who toil in shop and factory.

Truly, therefore, this is no time to hesitate. Let us show the World that the farmer has the brains and the manhood to take care of himself—once he is driven in a corner. Let's give the average farmer real cause to be proud of the great business of Agriculture—and I leave it to you whether this is true at the present time? The best of the winter lies ahead of us. So let's "shell off our coats" and get to work.

FAVORS A FARMERS' CO-OPERATIVE PACKING PLANT

To The Missouri Farmer:

In the December number of The Missouri Farmer you ask for expressions from your readers regarding your article, "What Can We Do?" Replying I wish to say I think we can do a great deal and I think you have hit the nail squarely on the head.

Let us farmers organize a $1,000,000 stock company and put up a packing plant. Let it be on the co-operative order, about as follows: Let one share be $10 and let 10 shares be a normal unit for full membership and let 100 shares be a normal limit for one member's holdings and let 1000 shares be the extreme limit of holdings.

Let no member draw a cash dividend on less than 10 shares but let dividends to members who hold less than 10 shares be cumulative and payable in stock until such members have 10 shares, after which they may draw cash dividends.

Let 100 shares be the limit of voting strength for any one member. If a member holds more than 100 shares let him draw dividends on his full amount of investment but let him not be empowered to vote the shares in excess of 100 and let 1000 shares be the limit of his holdings in any case; and let all shares in excess of 100 be subject to recall and reissue by the company.

Let the company organize with $500,000 paid up capital, that is to say when one half the shares are sold and the money paid in, let them organize and obtain charter with the membership holding one-half the shares and the company holding the other half blank to issue to new members as occasion may require and when these are exhausted and all excessive holdings of members about exhausted let some provision be made to increase the capital stock to perpetuate the scheme of increasing membership.

When a dividend is declared let the first payments be made to shareholders to the amount of 6% upon their investments. Then let the remaining portion of the dividend be appropriated about as follows: Say 90% be prorated to the patronage and 10% to the shareholders or some similar method which will recognize both patronage and capital stock on an equitable basis.

In apportioning dividends to patronage let outside patronage come in for a part equal to one-half as much as if said patrons were members of the company but let them not be paid in cash, let their dividend be cumulative and payable in stock. When their dividend amounts to $10 they will receive one share of stock and become members after which their dividend will be the same as other members but still cumulative and payable in stock until they have 10 shares which will give them full membership upon a normal unit of membership.

Let us provide for a maintenance fund against opposition in business as follows: Whenever a member sells anything to our company or to any other company that belongs in our line of business, let said member be assessed 1% of the proceeds of such sales for a maintenance fund. This will enable our company to advance the price a little to the membership to hold their trade, then if we fail in any case to get their patronage we will have their support any way and the competing firm that beats our prices will pay for the fiddling.

Let us be organized for wholesale and retail trade and have middlemen of our own to take the place of commission houses and retail and wholesale meat dealers.

I submit the above as my idea for the general feature of a packing company for farmers to organize. Of course you would not expect 100,000 farmers out of 277,000 to subscribe $10 each but you will find lots of them will subscribe $100 and may be a few that will subscribe $1000 or more, and I think in this way you will find it not a very difficult matter to raise the required amount.

Now you say, "Some of the ablest and most careful students of this problem believe it wise to establish a number of small packing plants in different parts of the state rather than one large plant." Very well. Just cut out the last five words of the above sentence and I will agree with that also. The farmers ought to have lots of small plants, in size all the way from a 16-foot slaughter house up to any size and capacity they may find it expedient and wise to build. But why should one idea conflict with the other? Why not puth both ideas? If farmers own the big plant and farmers own the little plants they should co-operate and strengthen the whole cause. But let us begin with one plant. Let us have concentration of power and concerted action on one plant and make that one plant a hummer. Then when that one plant proves a success and is all paid for and humming with business it will without doubt become the daddy of similar plants in other parts of the state and perhaps in other states, at least by example if not by extension of business.

Now, Mr. Hirth, you may take this little paper for whatever you may think it is worth and do whatever you think proper with it. You will no doubt get many good points from wiser heads all over the state and I trust you will develop the proper solution of these problems. And when you start to organize the farmers' packing company count on me for a subscriber. I am a poor man but I think I will chance $100 in it anyway if I can raise the money without embarrassment and I know of at least one nearby neighbor who says he will take a $10 share and I believe he will take $100 stock quite readily.

W. T. Cary, Carroll County

If you are for the great fight which The Missouri Farmer is making for a statewide farmers' organization which will be strong enough to shake off the strangle hold of the Packers, send us a dollar to renew your subscription at once—and if this reaches us promptly we will date you three years ahead and cancel all back subscription. The same offer applies to the "Farmers' Market Club" except that in this case we will date you two years ahead.

Just after the holidays now is a splendid time to organize a farmers' club. You will find plenty of work to keep the club going this winter and be ready to join the state association.

Anticipating Telephone Needs

When a new subscriber is handed his telephone, there is given over to his use a share in the pole lines, underground conduits and cables, switchboards, exchange buildings, and in every other part of the complex mechanism of the telephone plant.

It is obvious that this equipment could not be installed for each new connection. It would mean constantly rebuilding the plant, with enormous expense and delay. Therefore, practically everything but the telephone instrument must be in place at the time service is demanded.

Consider what this involves. The telephone company must forecast the needs of the public. It must calculate increases in population in city and country. It must figure the growth of business districts. It must estimate the number of possible telephone users and their approximate location everywhere.

The plant must be so designed that it may be added to in order to meet the estimated requirements of five, ten and even twenty years. And these additions must be ready in advance of the demand for them — as far in advance as it is economical to make them.

Thus, by constantly planning for the future and making expenditures for far-ahead requirements when they can be most advantageously made, the Bell System conserves the economic interest of the whole country while furnishing a telephone service which in its perfection is the model for all the world.

The Missouri Farmer

VOLUME VIII JANUARY 1, 1916 NUMBER 1

Courage---The Need of the Hour

By William Hirth, Publisher

Since The Missouri Farmer inaugu-rated its present campaign against the giant Packers' Combine—and it stands alone among the farm papers of the Corn Belt in this great fight at this time—three things stand out very dis-tinctly. In the first place, the fight has attracted the attention of a num-ber of men who, in years past, have had a close insight into the methods of the Packers and without exception these men are agreed not only that the time has come when something must be done but what is more im-portant still, all are agreed that something can be done if farmers will rouse themselves and organize. It goes without saying that these expres-sions have come, not from farmers but from business men who, in years gone by have had a close view of the great Packers' machine and who know from personal contact and experience how it works. When the real test of strength comes—when the big battle is once on—the advice and counsel of some of these men will be invaluable.

Secondly, we have received hundreds of letters from our subscribers who, without a discordant note, unite in saying that present conditions are in-tolerable—that the "hour for action has come"—that they are ready to pull off their coats and get into the fight" and in many instances these farmers have already succeeded in getting their neighbors to form a school district Farm Club or are en-deavoring to do so at this time.

The third and last feature of the fight which stands out plainly is the disposition on the part of many far-mers to say, "I don't believe farmers will ever hang together"—or words to that effect—and it is with this deaden-ing influence we wish to deal specific-ally in this article for, until farmers are aroused from the stupor which is responsible for this indifferent atti-tude we will not be able to get any-where in this great new movement to the success of which The Missouri Farmer is bending all its energies.

To recapitulate therefore some of the things we have said in recent is-sues, let us find out just where the average farmer stands at this time.

To begin with, statistics show that farm mortgages and farm tenants are constantly increasing. On the other hand, they also show that rural popu-lation is decreasing and that the al-ready overcrowded cities are levying a constantly growing toll on the youth of our farms—so that beyond question the majority of farmers are going backward rather than forward at this time and that this state of affairs will bring about a reduction in present land values is only a question of time. In many sections it has already done so and when this readjustment be-comes widespread there will be an end of the profit which thousands of farmers have made in recent years out of increased land values rather than out of their farming operations. That this condition of affairs has at last become acute—that we are at last face to face with a real crisis—that we are confronted by a situation which gravely menaces every farm home in the land—these things are surely ap-parent to every farmer who has the capacity to think clearly and they should challenge the manhood and self respect of every man who is anxious to clear his farm home of debt and guarantee to the children who are to come after him that freedom of oppor-tunity which was promised to all citi-zens by the Constitution of the Re-public when the fathers framed it years ago.

Packers Chiefly Responsible

The chief responsbility for this state of affairs centers, as we have said be-fore, around the great Packers' Com-bine and other interests closely allied with them. At a time when we are in the midst of the greatest foreign demand for American meats we have ever known, they are compelling the farmers of every Corn Belt state to lose millions of dollars on hogs and cattle. In the meantime, the millions of consumers in our great cities are equally helpless and at this moment are compelled to pay as high or a higher price over the butchers' coun-ter than they paid before the recent brutal assault of the Combine was in-augurated. Likewise, as we have stated before, the Packers constitute the most powerful factors in the "Wheat Pit." With untold millions of dollars of credit at their disposal and owning as they do the greatest line of elevators in the United States they ex-ercise more power in manipulating the price of American wheat than any other influence. So too, they are in control of the leather situation and in positon to levy their tribute upon the shoes of rich and poor alike—and from this source comes the marked advance in the price of footwear which the masses have felt so keenly during the last few years. Through the manu-facture of oleomargarine on the one hand and large centralized creameries on the other, they dictate the price of butter—while it has long been an open secret that their thousands of buyers of poultry products fix the price of every dozen eggs, chickens, turkeys, ducks and geese which the farmer's wife brings to market and that coun-try merchants and small independent buyers are powerless against them. Their dominance in the cottonseed situation by virtue of their ownership of scores of the big cottonseed mills of the south, we have also referred to previously. Likewise their power in the fertilizer market, their ownership of great soap and other by-product concerns, coal fields, salt mines, the grape juice industry and their great banks which hold mortgages on the cattle in half the feed lots of the Country—all these things are matters of common knowledge and this doesn't take into consideration the hundreds of millions of dollars they have in-vested in South America, Australia and other parts of the World where they are crushing all opposition out that stands in their way.

In Control of Nation's Food

In other words, this gang of con-spirators are in absolute control of the great essential food products of the Nation today and the farmers of the United States must choose and choose quickly between Agricultural bondage on the one hand—or upon the other, arising in their might and shak-ng off the strangle hold of this giant Devil fish which is sucking the very life blood out of the myriad farms of the Nation. These are the two courses of action which knock at every farmer's door at this hour. There is no middle ground—for there can be no honorable compromise with a gang of thieves. Again, deliverance must come from the farmer alone—for the consumer has no alternative but to pay the price asked. If he would live, he must eat—and hence he has no other choice but to pay the

---

A PERSONAL APPEAL TO YOU

If The Missouri Farmer is to succeed in the great fight it has undertaken on behalf of the farmers of this state it must have the active support of every reader of the paper. There is no one else to whom we can look for help. To this end, I make this personal appeal to you, kind reader, to send us a check for a dollar or a dollar bill (at our risk) by return mail for three years renewal—and if this is done at once we will cancel your back subscription and date you three years ahead from this time. The occasional privilege granted to banks and commercial clubs a couple of years ago to send the paper to farmers complimentary has been definitely discontinued—and no more sub-scriptions will be sent out in this way, for the privilege was granted only for the purpose of introduction. If you want to take advantage of our great new "Farmers' Market Club," send us a check for $1.50 when you will also be dated ahead as indicated above. But only promptness will secure this "dating" privilege for you.

On the other hand, if you really want to "put your shoulder to the wheel," take advantage of our "Special Club Proposition" and get three of your neighbors to give you $1.50 each for the "Market Club Plan" and send us a check for $4.50—thus getting your own "Market Club" subscription free. The "Special Club" offer will apply to farmers who are getting the paper now as well as to new subscribers—and the old ones will be dated ahead from the present time. It isn't because we think you will care so much to get your own subscription free as that we need your kindly help in getting your good neighbors to perma-nently join our list of readers. If we are to succeed in our effort to perfect a great statewide organization of farmers, The Missouri Farmer must become a vital, living force in every good farm home in Missouri—and this we cannot do without the help of men like YOU. In fact, the great movement we have undertaken is entirely in your hands. If every reader of the paper will "shell off his coat and get into the fight" we will soon set the state on fire with militant Farm Clubs from end to end—and then results will come thick and fast. So won't you please help? Won't you at least send us your own renewal at once—or join our "Roll of Honor" by sending in a "Special Club?"

The Missouri Farmer has, from the beginning, stood for your best interests. Four years ago it led the fight against the Single Tax and for the last two years it has led the fight for the Land Bank Bill which certain other farm papers are at this moment trying to stab in the back—while in the great movement for a powerful Missouri Farmers' Asso-ciation it stands single handed and alone. It is trying to rescue the farm homes of this state from the interests which are bleeding them to death—which are trying to make it impossible for you to pay off your mortgage—which hang like a dark pall over the future of your children—and I repeat that whatever we shall be able to accomplish in the great struggle we have undertaken depends on the support we receive from the farmers of this state—FROM YOU! If every farmer who reads The Missouri Farmer would send us a dollar—or better still, a "Special Club"—it would so strengthen us financially that we could give you the finest farm paper you have ever seen.

William Hirth, Publisher,
THE MISSOURI FARMER.

tribute which the System demands. In the past we chafed at these conditions —but I repeat once more that at last we have reached a crisis which we must either meet bravely and master —or, failing in this, bend our servile necks to the yoke for all time and when we fall by the wayside it will be adjusted to the necks of our children.

I have thought over the conditions which confront us dispassionately and soberly. I am not an alarmist and the few opinions I have expressed in these columns during the last five or six years will, I think, bear out this statement—but I say to the readers of The Missouri Farmer that a condition of affairs which permits a few men to set an arbitrary price on what the American farmer produces upon the one hand and upon the other an equally arbitrary price on what the millions must eat to keep body and soul together—that this is an impossible situation—that it menaces most gravely the very economic life of the Nation and that the hour has come when farmers must arise as one man and throw off this industrial vampire which is converting a land of natural peace and plenty into a realm where farmers and the millions of toilers in shop and factory are compelled to struggle for a mere existence.

No Time for "Doubting Thomases"

And now, my friend, what are YOU individually going to do about it? Don't you want what you are entitled to have for your year's sweat and toil? If there is a mortgage on your farm, wouldn't you like to have a fair chance to pay it off—or even if you happen to be out of debt, don't you think you owe something to the children who are to come after you? As a man and citizen, don't these pitiful conditions challenge your manhood and your self respect? Are you going to "pull off your coat and get into the fight"—or will you stand around like a "Doubting Thomas" and whine "What's the use?"—and thus dampen the ardor of your neighbors? Two or three of this kind of farmers can stop or at least seriously cripple the organization of a Farm Club in any school district in the state. In fact, if I had to name the greatest danger next to the Packers at this time I would unhesitatingly say, the spineless, indifferent, sleeping farmer who thinks that "nothing can be done."

Who knows that "nothing can be done?" On what is such a statement based? I have been making some investigations on this score lately and on the contrary I can find no instance in which a concerted organization of farmers has not accomplished in a large measure the things it started out to do. Conspicuous is the recent fight of the Tobacco growers of Kentucky and Tennessee who, by united action, compelled the Tobacco Trust to increase the price of their product from $3.50 to $9.00 per hundred—and yet when this movement first started there were a lot of farmers who said "nothing can be done" and it was the indifferent attitude of these men which later led to the unfortunate and lawless exploits of the "Night Riders." But once standing shoulder to shoulder, results came fast—and hence the Tobacco raising industry of these states is once more on a profitable basis. Again, there is the Fruit Growers Association of California which has also been a distinct success from the beginning and which has rescued the growing of oranges and other fruits from a precarious adventure to a dependable and money-making enterprise. In Wisconsin and Minnesota the hundreds of co-operative creameries which have been owned and successfully conducted by thousands of farmers for years have developed into the chief industry in those states—and the Packers' Combine has been powerless against them. Even so, free rural mail delivery and the Parcels Post were, as Mr. Ellis pointed out recently, the direct achievements of the old Grange and Farmers' Alliance which demanded these facilities so persistently that Congress finally yielded to their enactment.

Organization—the Crying Need.

As we have said before, the farmers of the United States resemble a sleeping Hercules. They are powerless only because they are not acting together. The Packers and the grain speculators are organized and move and act through power concentrated in the hands of a few men—and until farmers adopt the same tactics they will continue to resemble a disorganized, leaderless aggregation—but once we employ the same methods as do our adversaries there is no power on Earth which can prevail against us.

Of one thing I am absolutely convinced and that is that the future freedom of American Agriculture and the well-being of the millions who dwell in our great cities demands that some powerful system be developed as speedily as possible which will enable the farmer to market his products direct to the consumer in order that the two may equitably divide between each other the tremendous tribute which is now being poured into the coffers of the Food Combine. For years the government has tried to regulate them without success. They care nothing for occasional fines which represent but a mere bagatelle of their annual ill-gotten tribute—and they simply charge them up to the year's "profit and loss" and again, as we have hereinbefore stated, there is no honorable compromise possible with a gang of thieves. As Judge Bedford well says in his splendid article which appears elsewhere in this issue, we are paying an annual tribute of millions under the present system—so instead of continuing to pay this money into the bulging vaults of the Packers, why not use it in equipping plants of our own? The farmers of Missouri market on an average 4,000,000 hogs per year—and at $2 per head this would mean $8,000,000. Assuming also that we are selling 750,000 head of cattle at $10 per head less than the normal law of supply and demand justifies, this would amount to an additional $7,500,000. Here we have then at a most conservative estimate a fund of $15,000,000 which the farmers of this state will contribute this year to the Meat Combine under present conditions—and such a sum would give us twice the money necessary to equip plants of our own and free ourselves for all time from these great parasites which control the food products of the Nation. Mind you, I am not advocating the raising of money for this specific purpose at this time. What I am pleading for above everything else at this juncture is a powerful, statewide organization of farmers reaching into as nearly as possible every school district in the state in order that we may be in position to take in hand this great question intelligently and to the end that we may provide the machinery through which we can attempt its solution. Once powerfully organized we can thresh out the best methods of procedure. Beyond question, we must go forward cautiously. Not a dollar must be wasted or an impractical idea adopted when once we are ready for action—and so the overwhelming need of the hour is the organization of school district Farm Clubs and County Farmers' Associations, later to be amalgamated into a great Missouri Farmers' Association.

The Overshadowing Issue

Only of one thing I am becoming more and more convinced as I study this great question—and that is that, once thoroughly organized, we must provide the permament machinery through which the products of the farm can be sold direct to the consumer for then the problem will be settled for all time to come and a new era of security and prosperity will have dawned for the farm homes of the Nation as well as for the toilers in the cities. This, in my humble judgment, is the overshadowing issue before the American people and upon its successful solution depends the future well-being of the Republic and the conditions which your children and mine will face in the years to come when we are no longer upon Earth to help them fight their battles.

In the meantime, while we are girding up our loins for this great final struggle, there are many things, as was pointed out in our recent article describing the Warren County Farmers' Association, which your school district Farm Clubs can do and which will save your members a lot of money through co-operative action—such as the buying of farm seeds, feed in carload shipments, fertilizers, coal, the crushing of limestone and other similar things which bear too great a tribute under existing conditions. We have prepared a complete program for Farm Clubs, a suitable Constitution and By-Laws and methods of procedure which will make it possible for the farmers of any school district to organize without outside help—and it is free for the asking.

In conclusion, let me once more appeal to YOU, my friend, to "pull off your coat and get into the fight" without delay. Quit saying that "nothing can be done"—and thus dampen the ardor of your more enthusiastic neighbors. Surely nothing can be accomplished unless we try—and when we have tried in the past success has almost invariably crowned our efforts. Remember that next to the industrial highwaymen whom we are opposing the greatest menace of the present hour is the indifference, and the "don't care" attitude of farmers themselves. This is no time for the throwing of cold water or for pessimism. We are

Three Hundred Million Bushel Crop in 1915

Farmers pay for their land with one year's crop and prosperity was never so great.

Regarding Western Canada as a grain producer, a prominent business man says: "Canada's position today is sounder than ever. There is more wheat, more oats, more grain for feed, 20% more cattle than last year and more hogs. The war market in Europe needs our surplus. As for the wheat crop, it is marvelous and a monument of strength for business confidence to build upon, exceeding the most optimistic predictions."

Wheat averaged in 1915 over 25 bushels per acre
Oats averaged in 1915 over 45 bushels per acre
Barley averaged in 1915 over 40 bushels per acre

Prices are high, markets convenient, excellent land low in price either improved or otherwise, ranging from $12 to $30 per acre. Free homestead lands are plentiful and not far from railway lines and convenient to good schools and churches. The climate is healthful. **There is no war tax on land, nor is there any conscription.** For complete information as to best locations for settlement, reduced railroad rates and descriptive illustrated pamphlet, address

GEO. A. COOK,

engaged in a struggle in which is involved the future of our farm homes—and if you can't help, at least don't make the task more difficult for your more courageous neighbors. But just as certain as you are living the Band Wagon is coming and a little bit later on you will be glad to scramble on board—and then you will lustily join in the grand chorus and shout "We killed the bear" along with the best of them. Throughout the length and breadth of the land farmers are aroused as never before—but there is still time for Missouri to set the pace. So call up your neighbors, "light up the little school house" and be a leader rather than a "camp follower" after braver hearts have blazed the way—for "we are coming Father Abraham" and don't you forget it.

THE TOLL OF THE PACKERS

I am glad The Missouri Farmer is bringing out the importance of the Land Bank which is bound to be of incalculable benefit to farmers. But in my opinion the injury from high interest does not compare with the toll we pay the beef trust. I feel sure I speak the truth in saying that four out of ten feeders have lost money for three years and five more have barely missed loosing money. About six men constitute the beef trust; the same six men own the stock yards at most if not all the big centers. They furnish the moldy hay we are charged a dollar per 100 for. They furnish more cattle paper than is furnished from any other source and are thereby able to create a run and lower the price whenever they desire. They have crushed out nearly all opposition. There are many living today who remember when every big market had hundreds of small slaughterers bidding for stock but today six men fix the price at all the markets. It has been but a few years since the beef consumed in every small town was slaughtered there but these six men forced them to quit by underselling and then raising the price after they had been forced to quit. These same six men control the price for your hogs, your mutton, your poultry, your eggs. Today the bulk of cattle and hogs are 2 to 3 cents lower than three months ago and yet meat to the consumer is not lowered. I asked men while in Chicago recently who told me the price on no kind of meat had been lowered. These men have robbed the feeders out of enough money to own the stockyards, all of the big killing plants, much of the stock of railroads, many of the largest banks, the terminal companies, immense cattle ranches both in this country and South America, enabling them to flood the markets with their own cattle to depress prices They also own the largest elevators for holding grain in the United States, thereby controlling the price of bread.

Now, my fellow farmers, is there nothing we can do to stop these fellows? I believe there is enough brains among the farmers to formulate some plan if we would but meet and discuss such things. I know we could have choked the life out of them years ago when they were not so strong, and remember they are growing bolder and stronger every day. What we do must be done quickly. The thing we need is competition. Your heavy sows always bring one dollar or more less than lighter hogs, because eastern butchers compete with the packer for the lights and because they are more suitable for the fresh meat trade. And yet the packer charges the same for the lard from the old sow that he does from the young hog. His mess pork is all one price, his dry salt pork is all quoted at one price. As a sample of the immense profits made by the packers; by killing 30 hogs I have been able to sell enough meat and lard to clear 40 hams and enough lard and bacon to supply my family for a year.

What do you think of the plan suggetsed by The Missouri Farmer, to issue capital at $10 a share value and raise one or two million dollars? You are now contributing to the pockets of the packer at least $2 for every hog you sell and $10 for every steer. This means that if you sell ten hogs you give the packer $20 and if you sell 100 hogs you give him $200. A $2,000,000 plant located in St. Louis would save for the state many millions and make money for the stockholders.

If there was a condition of stagnation the present price of cattle and hogs would be excusable. This lowering of the price of the live carcass at a time when their exports are more than double what they were one year ago is absolutely inexcusable.

To substantiate what I have said about prices being too low this year as compared with last year, I give below the amount of exports of meat products for the first ten months of both years. The first or left hand column shows the amount and value of the various products for 1915 and the right hand column the corresponding amounts for the same ten months in 1914. In every single item there is a very large increase of exports for this year and certainly there has been an equally large home consumption of meat products. So if prices were based on supply and demand surely prices would be higher now than a year ago.

Exports of meat products for ten months, January to October:

	1915	1914
Canned beef, lbs.	63,937,461	16,668,970
Value	$ 9,976,630	$ 2,878,959
Fresh beef lbs.	218,168,774	12,494,769
Value	$ 28,073,197	$ 1,647,714
Pickled beef, lbs.	37,634,638	18,407,761
Value	$ 4,075,104	$ 1,815,626
Oleo oil, lbs.	87,183,468	74,349,059
Value	$ 10,358,393	$ 7,656,880
Bacon, lbs.	420,451,068	143,313,752

John S. Bedford,
Boone County.

IS WORTH ONE DOLLAR AN ACRE

Carthage, Mo., Dec 20, 1915.

My Dear Mr. Hirth: Your very kind favor of the 17th inst to hand. Don't worry on account of my offer of five subscriptions as prizes at our Jasper County Corn Show. When I subscribed some time ago for my tenant I wrote that I thought it the best investment I could make and it has turned out as I thought. The boys on my farm have studied every article on soil improvement, selection of seed corn, preparation of ground, time of planting, and manner of cultivation, and as a result two of them have unaided raised 3600 bushels of corn as fine and solid as ever went into the crib. The yield was 55 bushels per acre. One of them, W. R. Nichols, took first money for the best 10 ears of yellow corn and the sweepstakes prize for the best 10 ears of any color. My subscriptions to your excellent farm paper has brought me at least one dollar per acre increased rent on my land planted to corn. Don't you think you are entitled to at least a small per cent of this increased rental brought about by your paper?

Wishing you success in the coming year, a Merry Christmas and Happy New Year, I remain, Your friend,

A. L. Thomas.

Editor's Comment: We appreciate this very complimentary letter from so able an authority as Judge Thomas and we are just wondering if a lawyer who farms only for the money there is in it can get a return of one dollar an acre by having his tenants read The Missouri Farmer, what ought it be worth to the man who owns the land he tills? But Judge Thomas does not stop with subscribing for the paper or his tenants with just reading it—they study it—study the special articles that may suit their conditions from time to time and that is why they get so much profit out of it. Judge Thomas is near the four score mile post but he has time as the above letter shows to direct his farming so that it pays.

Have you any seed corn, cowpea seed, soybeans or other farm seeds for sale? Or do you want to sell some live stock, farm implements, rent, sell or buy a farm—or are you in the market for any of these things? If so, you should by all means belong to our "Farmers' Market Club." Then you will be entitled to list free of charge the things you want to sell or buy in our Monthly Bulletins which will be mailed free to all members. The time has come when farmers must deal more directly with each other and save marketing expenses.

Have a "warm-all-over" house

In cold weather do you hate to go upstairs or from one room to another? Do you huddle up in one or two rooms and often suffer from chill or drafts? If you are comfortable in only, say, 3 of the 8 rooms of your house, you are getting the use of only *three-eighths* of what your house costs—a poor investment! Make a warm, cheerful *home* out of your *whole house* by putting in an outfit of

Do not live like this five months every year!

AMERICAN RADIATORS & IDEAL BOILERS

IDEAL Boilers and AMERICAN Radiators enable you to enjoy every room, hallway, nook and corner of the house. Not only do you get the full use and enjoyment of the home, but IDEAL Boilers and AMERICAN Radiators will actually pay for themselves in the fuel savings.

They are so simple to run, and so thoroughly rid the house of ash dust (giving long life to furniture and decorations) that house-cleaning is reduced one-half. IDEAL Boilers are the only heaters so made that all the coal-gases and soot are kept inside the boiler — burned there — thus protecting the family health. No other heating apparatus in any way competes with IDEAL Boilers and AMERICAN Radiators, hence their rapid and wide use in farm houses and other buildings—more than a million installations at home and abroad.

Phone your local dealer but specify and insist on IDEAL Boilers and AMERICAN Radiators. Do not take any other. In so important a matter you can not afford to run any risks, especially when IDEAL Boilers and AMERICAN Radiators are so fully *guaranteed* and cost no more than inferior makes. They protect the farm house against fire risk and run independently of water works supply or mains, as same water is used over and over again for years.

The smallest farm cottage or largest house is equipped at very reasonable cost. At present low iron market the cost will surprise you. The IDEAL Boiler is put in cellar, side room or lean-to and will burn any local fuel—wood, oil, gas, lignite, hard or soft coal (even cheap grades of pea coal, slack, run of mine, screenings, etc.) If warm cellar spoils vegetables, boiler and pipes may be covered and all heat then goes to upper floors.

A No. 4-19-W IDEAL Boiler and 270 ft. of 38-in. AMERICAN Radiators, costing the owner $200, were used to heat this farm house. At this price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions.

Our catalogue (free) is a volume of concise heating and ventilating information which every owner or tenant—small or large—in country or town—ought to have. Write us today. All inquiries cordially welcomed.

No obligation to buy.

AMERICAN Radiators and IDEAL Boilers change any house into a *home*.

Showrooms in all large cities

WITTE ENGINES

BEFORE you buy any kind of a gasoline or kerosene engine, write for my offer, under which I send an engine to earn its own cost while you pay for it. Stationary Engines at **less than $17.50 per horse-power**—2 H-P, $34.95; 3 H-P, $52.45; 4 H-P, $69.75; 6 H-P, $97.75; 8 H-P, $139.65; 12 H-P, $197.00; 16 H-P, $279.70; 22 H-P, $359.80. (*F. O. B. Factory*). Portable Engines and Saw-Rig outfits proportionally low. **Guaranteed high quality**—thoroughly proven during 29 years by many thousands in use at all kinds of work in every state.

Guaranteed 5 Years

Cash or Easy Terms

For my low prices, and under my easy terms of payment during a whole year, you can now, more easily, and better, afford to own an engine, than to do without one.

Fine Book Free My free book, "How to Judge Engines," will show you how to select the right engine, and it will save you money that you want to save, whether you buy now or later. Write me, now.

THE TRAIL OF THE INSTITUTE MAN

December 6 and 7 found me at Elsberry. I had never stopped off at that town before but just presumed it a typical river town with many huts and much rubbish and filth along the banks of the river, but not so do you find Elsberry.

The first thing that pleased me was to be met at the train by Mr. Crank who showed me to their fine hotel so well conducted by Bill Bailey. That town and Bill Bailey know the value of a good, comfortable, clean hotel to any town. A good hotel readily spreads its good name and all the grip luggers know where they are.

I was then taken to the show and lecture room where they had assembled a fine lot of corn, cakes, fancy work and folks—all of which reflects splendidly for Elsberry and surrounding country. Of course not all the folks there could be called really good looking, especially after my arrival, but anybody would surely be pleased with that bunch. The corn was good and lots of it on exhibit.

After supper I took a stroll up town and was again well pleased to see well stocked stores, neatly kept, and the daylight next day revealed the fact the town is kept nice and clean. "Rah" for Elsberry.

The next stop was in the good town of Carrollton to attend County Agent Cook's "Round Up," and it was sure some round up. The corn show was not large but most of the corn was very good. The displays in the courthouse were excellent and the poultry show was high class so far as I am able to tell anything about chickens. The lectures were well attended and the crowds at the roundup were simply so large and in so many places that it would be difficult to estimate them. The people are surely "talking" over there and "that feller Cook" can be blamed for a lot of it.

Next the Agricultural Congress at St. Joseph was to be "taken in." The corn and apple shows were strictly high class. So far as I could observe the greatest stress was placed on the lecture work. I did not get to hear many lectures except my own, which, of course, were good. You see I have to brag on myself some since nobody else will do it for me. The program and show were worthy of a great attendance, but this was to some extent interfered with by bad weather. Even though the attendance was not all that could be wished for it was good and enthusiasm is high for a repetition of the congress next year.

Sam Jordan.

THE KENTUCKY-OHIO TOBACCO ORGANIZATION

The editor has asked me to tell his readers how we, the tobacco growers of Ohio and Kentucky, in 1906-1910, organized in behalf of better prices.

You will pardon me if at various times during this article I digress from the main theme and give some reasons why the organization failed to stand the test of long time, for while it was very successful in bringing better prices for a few years, it is now inactive.

Throughout the White Burley tobacco district, comprising forty counties in Kentucky and four each in Ohio and Indiana, it costs about seven cents per pound, in actual labor at current rates, to produce and market a crop of tobacco, and in 1906 the price paid growers did not average more than 5½ cents per pound. The American Tobacco Company, or its predecessor, the Continental, manufactured 82 per cent of all the tobacco in the United States, so it may be seen that it was in a position to pay just what it chose for the raw leaf.

The growers of export tobacco, in what is known as the Black Patch of Kentucky, had made a pool of their crops in 1905, and had been successful in obtaining better prices, and so much better prices that we who operated a much larger district began the herculean task of organizing our forces.

It was done as Mr. Hirth suggests. "A light in every school house," and within three months' time we formed an organization which put millions of dollars into the pockets of our members. We first organized local unions at the school houses, then county unions at the county seats, and finally, a general organization was formed by sending representatives from the county unions. Our local membership fee was one dollar, and at the county meetings the expenses of the representatives to the general meeting were met by subscription.

As a factor in building the organization, the country press was invaluable, as with but few exceptions the publishers opened their columns freely to us, and some took the field to assist in the work.

Here let me emphasize one thing and that is the importance of regular meetings of all local clubs or unions and these regular meetings attended by every member who can possibly be there. When we allowed our local meetings to fail, from that time on our work began to lose its effect.

The plan finally decided upon was the renting of warehouses and the packing of all the tobacco of the members as a pool, each man's tobacco being graded by experts as it was weighed from the wagons, and a warehouse receipt being given him. It was supposed that the banks would advance at least 50 per cent on these certificates, but just as we were ready to work, bank officials discovered something in the banking laws to prevent it. The county mass meetings were held and in some countes as much as $50,000 was pledged as capital for a new bank, when the bankers "saw a new light" on banking laws and decided that they could advance the 50 per cent on the certificates.

It was eighteen months from the day we put our tobacco into the warehouses until a sale was made, but that sale brought more money into the farmer's hands than the sale of the two previous crops entire had done.

In the meantime a crop had been grown and packed under the same plan as the first, and in addition to this a cut out of the 1908 crop had been effected, but of this and other matters will have something to say in another article.

Georgetown, O. C. D. Lyon.

ABOUT SERUM AND VIRUS FOR CONTROL OF HOG CHOLERA

The state veterinarian of Indiana makes explanation of his position on the use of serum and virus for the control of hog cholera in the following letter addressed to The Missouri Farmer under date of December 17, 1915:

Dear Sir: I am writing you in regard to an article that appeared in your journal written by Dr. J. W. Connaway of the Agricultural Experiment Station of your state, as I believe that this article may appear misleading to the public as regarding my attitude on the serum simultaneous method.

In the issue of June the 1st of "The Swine World" appeared the article by me from which Dr. Connaway quotes. In this article I tried to make plain to the public the trouble that this department has experienced following light dosage and serum of low potency among healthy herds in this state. This referred to herds visited after vaccination by the simultaneous method by local veterinarians and also by farmers themselves. It was the careless methods and light dosage, as well as serum weak in potency, that made me make the statement that I regretted to see virus used in localities that were free from hog cholera.

In localities where hog cholera is prevalent we advise the simultaneous method, as after infection is in the herd results are never as favorable as in healthy herds. In sick herds we always advise the simultaneous treatment of all that are large enough to double treat that do not show clinical or physical symptoms and the treatment by serum alone of those that have high temperatures that are not showing physical symptoms; also serum alone on all small pigs weighing under fifty pounds.

I believe that if all persons that administer serum use caution, and the owner of the animals will observe all precautions that are necessary to prevent the spread of the disease to other swine by isolating those vaccinated for a period of thirty days so that they will not roam all over the premises, that the dangers of using the simultaneous method can be minimized. What I have been trying to do is to impress upon the farmer and breeder the necessity of observing all precautions to prevent the spread of hog cholera and not get careless about cleaning and disinfecting his premises after the disease is on his farm; also to use every precaution when other swine are brought on the premises by washing them, as well as the crate in which they are shipped, in a disinfectant, and isolating them for a period of at least two weeks. I believe that strict quarantine methods and disinfection of premises are always absolutely necessary, but I do not discard serum as a means of helping to save the hogs, as the two are inseparable. Much better work is now being done than has been in the past, as evidenced by our field reports.

The serum companies of this state are with only one exception complying with the Indiana law, and this one person, who served an apprenticeship in the West, seems to be imbued with the idea that he is not amenable to the Indiana law and that a cheap proposition will appeal to the farmer, regardless of whether the product is a tested and approved one or one made to sell regardless of sanitary surrounding or testing for potency.

As long as this continues, and some persons outside this state do not comply with the state law, there is bound to be either bad results or swine that are left without any permanent immunity, as some of these persons are treating hogs for less than it costs to produce the serum if the proper surrounding and tests were made to insure its potency and freedom from septic organisms. I might add for the information of the public also that the majority of the losses which I mentioned in the article from which Dr. Connaway quotes were from a serum and virus not made in the state, and used in violation of the Indiana law.

I am inclosing a copy of a form letter which was sent out to the different veterinarians within the State of Indiana:

Dear Doctor: Hog cholera is probably more prevalent at the present time than ever before within this state. Vaccination of healthy hogs has in many cases started new centers of infection and invariably we find on investigation that light dosage is responsible. Dr. Paul Fischer, Ex-State Veternarian of the state of Ohio, gave as his opinion in an article that appeared in the Swine World, "That twice the test dosage used in serum plants is necessary in the field due to lack of proper feeding and sanitary conditions, which can not equal those at serum plants where every precaution is used in care and also in feeding after vaccination."

Veterinarians employed by the United States Department of Agriculture do not give less than thirty-five cc's. of anti-hog-cholera serum to shoats weighing fifty pounds where the simultaneous method is used against one cc. of virus. They state that on account of treating only infected herds that any animal that has a normal temperature may get infection from exposure also, and that five cc's. more is given than would be given in healthy herds.

Many Western serum companies are labeling their product, recommending as low as twenty cc's. for a hog weighing one hundred pounds; also many recommend the simultaneous method for small pigs. Both of these propositions are causing trouble, as the small pigs will not hold their immunity, and those receiving the small dose of serum will, if the virus is active, develop hog cholera often about the fourth week.

Our recommendations are:

Never double treat animals weighing less than forty pounds, and if in non-infected localities less than fifty.

Never give less than thirty cc's. of serum to any pig when the simultaneous method is used.

Take the temperature of every animal and do not give virus to those whose temperatures are above 104° Fahrenheit.

See that animals are placed in clean pasture where there are no wallows, or in a building with cement floor that has been disinfected and bedded with clean straw.

Be sure that syringes are sterilized by boiling before using, and that the skin over the site of injection is cleaned with an antiseptic before injection is made. You should paint the surface with tincture of iodine after injection.

Never use less than one cc. of virus if you wish to produce immunity.

Advise owners to burn promptly all animals that die, and destroy all that are hopelessly sick, then to clean up premises and disinfect, using a three per cent (3%) solution of Liquor Creosolis Compound, U. S. P. Also have him kill all pigeons and prevent as far as possible carrying of disease to non-infected herds.

Never try to do a cheap job. Results are what the stockman wants, and you can easily demonstrate this

FRIENDSHIP THAT COUNTS

The other day we received two letters and two checks amounting to $7.50 from Mr Oscar Royse of Kewanee, Mo. First, Mr. Royse had written out a check for $1.50 to cover his own subscription and membership in the "Farmers' Market Club." Then there was a second check for $6.00 and a second letter in which he said: "After I wrote my check I got to thinking about the great fight The Missouri Farmer is making for us farmers and what a fine thing your new "Farmers' Market Club" is—so I concluded to call up some of my neighbors and tell them about it. The first four I called said, "Sure, count me in"—so I am sending their money and names and expect to get a lot of others for you soon." The reason we mention this incident is because Mr. Royse is the kind of friend The Missouri Farmer needs at this time and if we had one like him in every school district in the state we could soon set Missouri "on fire" with a great statewide farmers' organization and soon the movement would spread to Iowa, Kansas, Illinois and other states. There are two kinds of friends in the World. The first kind offer to come over and "sit up" when you or your family are sick. The other kind say they are "sorry to hear you've been sick"—after you are well or dead.

1916 STATE FAIR CHAMPION

I BUILD BREED CHAMPIONS

1916 SEPARATOR ENGINE SPREADER

D-27

JUST LOOK AT THESE WINNERS!

The illustrations in this ad represent winners! I believe in breeding winners, manufacturing winners and selling winners. I would not breed from a poor cow, nor would I manufacture a poor cream separator, gasoline engine or manure spreader.

Fay Jewel Beauty, Holstein cow, twice Grand Champion at National Dairy Show 1911-12; Grand Champion Minnesota State Fair, Waterloo Dairy Show, St. Louis Fair; Senior Champion Iowa State Fair, 1915.

GALLOWAY SANITARY BATH-IN-OIL CREAM SEPARATORS

The best separator on the market today and I have seen them all. For beauty, simplicity of design, workmanship and mechanical perfection, and years of service built into it, positively it can not be equalled. If you knew all there is to know about building cream separators and built one for yourself, it would not be a better machine, would not run any easier, nor skim any closer, and could not be built of better material, nor have more long wear and satisfaction built into it, nor would it be more perfectly sanitary. If you built as good a machine you could not build it at a lower price than my new, low 1916 figures. Not built down to a price, but built up to a high standard and sold to you at one small factory profit based on tremendous quantity. My new catalog is free for the asking.

34.50

New 1916 Galloway Sanitary Bath-in-Oil Separator. A champion for simplicity, beauty, skimming efficiency. In every community one of them sells many more.

THE NEW 1916 MODEL GALLOWAY MASTERPIECE 6 H. P. ENGINE

is taking the gasoline engine field by storm. My other masterpiece models from 4 h. p. to 16 h. p. moguls are power kings of their kind. My 1¾ to 2¼ h. p. pumping and light work engines have never been equalled. When you buy an engine insist on heavy weight (because it costs more to build a big, heavy, long-life engine) insist on large bore, long stroke and low speed. These Galloway features mean lifetime service at hard, tough, power-eating jobs. **Do not get fooled.** One cylinder, high speed, light weight engines **won't** give you the satisfaction that heavy weight, long stroke and large bore engines will give you. My new 160-page four-color catalog will tell you in detail about every style and size Galloway engine from 1¾ h. p. up to these giants that tackle any and every job.

Nona Spencer, Ayrshire heifer, Grand Champion over all females Iowa, Minnesota State Fair, Waterloo Dairy Show; Junior Champion St. Louis, 1915.

NEW 1916 MODEL NO. 8 LOW DOWN MANURE SPREADER

When I started in the manufacturing business years ago I determined that I would manufacture the leading article of its kind. The thousands upon thousands of manure spreaders that I put out the first year or two built my reputation They were the best spreaders offered to the farmers of America. My new No. 8 Low Down is positively the best spreader I ever built and thousands of customers say it's the best in the world, and they ought to know. My spreader factory is running full blast, turning out my new 1916, No. 8 Low Down spreader with the cut under front wheels, steel beater and new V-shaped rake. Its equal has never been produced for light draft, ease of operation, simplicity and sound mechanical construction. Catalog describes it fully.

WILLIAM GALLOWAY COMPANY, 597 Galloway Station, Waterloo, Iowa

Auchenbrain Good Gift, Ayrshire bull, Grand Champion Iowa State Fair, Waterloo Dairy Show; St. Louis 1915.

King Segis Pontiac Ormsby my $10,000 Holstein bull 23 months old, winner of Grand Champion Ia. and St. Louis fairs. Junior Champion at Minn. fair and Waterloo Dairy Show 1915.

98.75

Galloway 6 h. p. Masterpiece engine, with 1916 improvements. A champion on every farm where used.

Galloway 16 h. p. portable. Handles biggest, toughest, hardest jobs anywhere. A champion of power, simplicity and design.

64.75 UP

Galloway No. 8 Low Down Spreader, the machine to make champion corn crops on every farm.

1916 PRICES LOWER 1916 QUALITY HIGHER

by careful work. When you have good results with a serum made by persons that are complying with the Indiana law, do not listen to propositions based on a cheaper cost.

Discourage the handling or shipping of diseased hogs, and impress upon every stockman the necessity of co-operation with yourself and the state and federal officials that are trying to assist in eradicating hog cholera.

A. F. Nelson,
Indiana State Veterinarian.

Editorial Comment: We are very glad to give space to Dr. Nelson's reply because we think it contains some excellent advice on the value of sanitation in the control of hog cholera. We do not think any of our readers have been misled very much since reading the above because the main facts set forth in the above reply are in entire harmony with the articles of Dr. Connaway which have appeared in The Missouri Farmer, and with the editorial position we have maintained on the practicability of using the simultaneous method for the control or possible eradication of hog cholera. We have maintained all the time (1) that hog cholera is causing much greater loss today than at any time before serum was discovered; (2) that granting that it is possible to finally eradicate cholera by the use of the simultaneous method its general or universal use would make the cost so high that the swine industry can not afford it. Now just for the sake of emphasis let us repeat what Dr. Nelson says above: "Hog cholera is probably more prevalent at the present time than ever before within this state. Vaccination of healthy hogs has in many cases started new centers of infection and invariably we find that light dosage is responsible." There is no disputing the fact that the losses from cholera are greater because statistics prove that the number of hogs condemned at the big packing plants have increased every year for the last five years. The U. S. Secretary of Agriculture in his report for 1914 estimates the loss from cholera throughout the whole country at approximately $60,000,000 and the 1915 report places the loss at $75,000,000. That is a pretty big increase for one year but if we go back only two years to Secretary Wilson's report we find that the estimated loss from hog cholera was placed at only $18,000,000. Now granting that the spread of the desease from new centers is all due to light dosage and we increase the dosage as Dr. Nelson advises we impose a tax upon swine raisers, if it is universally enforced, as it must be if we get cholera under control that will take the orpfits all out of the business. And then even Dr. Nelson makes no further claim than that it will minimize the danger.

Counting the cost of serum and virus, the cost of vaccination, the average losses from the use of virus, the loss of condition and weight of hogs while treating the hogs it will amount to a tax of $2 a head at the most conservative estimate and when this is applied to all the hogs of the country as it must be if we get rid of cholera, so far as Missouri is concerned we do not believe there is enough profit in raising hogs to pay the cost. And that is sufficient reason to be against it.

WINTER CARE OF SHEEP

Most all of our sheepmen are taking better care of their flocks during the winter time than was formerly the rule and of course it pays. Tightly enclosed shelters are neither necessary nor advisable. The sheds or barns need first of all to be kept dry underfoot and there should be sufficient room under shelter or in outside yards for exercise. During the fine days of winter it is a good plan to compel the ewes to walk a reasonable distance to a field or another yard for their hay. For shed room fifteen square feet to each sheep is generally allotted. The fleece keeps the body warm and the overhead protection needed is such as will keep off storms and prevent drafts. In quite cold weather if the nights are dry, sheep often prefer the open air to enclosed sheds. When the flock varies as to size and some are much more timid than others, better results are obtained from dividing them into uniform bunches. The rams must be kept separate, of course, and in no more than good condition. Alfalfa or pea hay and one-half pound of bran and oats daily for each ram is ordinarily sufficient while in the beet district they are allowed to graze on the lops and tops occasionally.—Denver Field and Farm.

Four years ago The Missouri Farmer led the fight against the Single Tax just as during the last two years it has led the fight for the Land Bank Bill—the greatest measure ever passed in the interest of farmers in the history of this state—and the question is, brother, don't you think that this kind of a farm paper is entitled to your support?

ACTION OF PLANT FOODS

In considering the part played by the plant foods, nitrogen, phosphoric acid and potash in the growth of the plant it must be kept in mind that the effect of any element is largely dependent on the other elements necessary to plant growth being present in normal amounts, that all the elements working together are essential to maximum crop production and that even when these are present the results obtained by their use are often very materially affected by cultural and climatic conditions.

Considered from a broad standpoint it is generally conceded that:

Nitrogen exerts its greatest influence on the amount of foliage, the flowering process, maturing, color, growth, quality and disease resisting power of the plant.

If insufficient available nitrogen is present there will be a lack of foliage, stalks or stems will be short, leaves or blades small, color yellowish, weight of foliage, straw and grain or fruit less than when required amount of nitrogen is available.

If excessive amounts of nitrogen are used the growth of foliage will be out of proportion to the grain or fruit, the growth, development, and maturity of the crop retarded, a tendency to softness of the tissues and apparently less power to resist attacks of fungous diseases.

Potash is apparently essential to the formation and transference of starch and other carbohydrates, has an important part in the development of leaves and woody parts of stems, stiffens the stem, stalk and straw, assists in the development of the fleshy parts of fruits and makes the plants more resistant to the attacks of fungous diseases.

Lack of potash results in weak plants while excessive amounts delay the maturing of the crop.

Phosphoric acid in available form favors rapid development of the young plant, hastens maturity, increases the proportion of grain to straw, assists in developing the grain and is necessary to the development of protoplasm without which there could be no plant growth.— Indiana Experiment Station.

What difference does it make whether you originally subscribed for The Missouri Farmer or whether some bank or commercial club sent it to you? Should that keep you from becoming a subscriber in your own right? The question is whether you believe in the fight we are making to compel a "square deal" for farmers and whether you are willing to contribute your mite to its success. We don't want to force the paper onto anybody—but we are fighting **your** battles and believe we are entitled to **your** support.

THE MISSOURI FARMER

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

IS THERE ANY DOUBT ABOUT IT?

With all the facts and arguments we have given in The Missouri Farmer for the past few weeks to show that the packers fix prices of fat cattle, hogs, sheep and other food products if there is any doubt about it in the minds of our readers we have still further evidence to convict them of the charge. At a conference held a few weeks since in Chicago, held on the call of the United States Department of Agriculture, a large body of delegates assembled to consider what could be done to improve the present methods of marketing live stock and distributing live stock products. The conference was managed by the chief of the division of markets, Mr. Brand. Delegates represented most all industries interested, farmers, ranchmen, U. S. officials, colleges of agriculture, railroads, packers, shippers and commission men. Perhaps the strongest and most positive evidence against the packers was made in a paper read by A. E. De Ricqles of Colorado, who has had large experiences as a Western live stock shipper. From official and undisputed sources, Mr. De Ricqles showed that during the first ten months of 1915 the receipts of both cattle and hogs at the big markets including Chicago, Kansas City, Omaha, St. Louis, St. Joseph and Sioux City, were very much less than for any year except one during the last five. Here are the figures showing the receipts of these six markets for the last five years:

Year	Cattle	Hogs
1911	7,071,000	15,496,000
1912	6,365,000	15,751,000
1913	6,366,000	15,175,000
1914	5,614,000	13,258,000
1915	5,844,000	14,690,000

Now what about prices the packers paid to live stock producers? The average Chicago price paid for native beef steers during the first ten months of 1914 was $8.79 per cwt., as compared with only $8.12 paid in 1915. The average price for fat cows and heifers was $6.63 in 1914 and only $6.12 in 1915. For fat hogs the 1914 price was $8.49 and only $7.19 for 1915. Now as to the demand for meats we know that there were more people at work in 1915 than in 1914 and consequently a better home demand for meats and exports were larger by hundreds of millions of pounds. "During the nine months ending September 30, 1915, there was exported from the United States, 266,551,702 pounds more beef than during the same period for 1914. This enormous amount is equivalent to about 533,000 head of cattle. So you see this would absorb the increase of 230,000 head shown above and leave an actual decreae of 303,000 cattle as compared with 1914. In addition to this exportation of beef and its products, the exportation of pork products, etc., during the same period as compared with last year, increased 400,804,000 pounds." Estimating the weight of hogs at 200 pounds the increase of exports represent more than 2,000,000 hogs, whereas there were only 432,000 more hogs received.

Here are the itemized figures of exports of beef and pork for the same nine months, January to September, for 1914 and 1915:

Beef	1915	1914
Canned	61,016,625	7,707,834
Fresh	207,255,532	11,707,893
Pickled	35,032,726	17,337,454
Total	303,304,883	36,753,181
Increase	266,551,702	

Pork	1915	1914
Bacon	368,308,000	129,727,000
Hams and Shoulders	207,808,000	110,720,000
Lard	344,263,000	308,804,000
Pickle Pork	48,261,000	30,256,000
Lard comp'ds	49,797,000	38,126,000
Total	1,018,437,000	617,633,000
Increase	400,804,000	

The packers not only control the facilities for marketing meat animals but they control almost absolutely the retail butcher trade and that is why the consumer gets no benefit of the lower prices paid the farmers. As an actual fact we have only to go into any local butcher shop to find out that retail prices of meats are no lower than a year ago and in some instances we have found them to be actually higher.

But what are we farmers going to do about it as we have so often asked in the columns of The Missouri Farmer?

FARM CLUBS FORMING EVERYWHERE

Every mail brings letters to The Missouri Farmer telling about Farm Clubs which have been formed or which are in the process of formation and we believe we are safe in saying that not less than one thousand such organizations will be perfected in different parts of the state before the end of January. In the meantime, more than a dozen big county farmers' mass meetings have been planned in as many different counties for the purpose of organizing a County Farmers' Association. Perhaps Warren County has more Farm Clubs at this time than any other county in the state—but the interest is very keen in Livingston, Macon, Lafayette, Bates, Audrain, Henry, Sullivan, Atchison and a number of others. This is also true of Boone in which perhaps a dozen clubs have been formed within the last two weeks—the latest one being in the Wade district which starts in with 25 members. Thus this great new movement is thoroughly launched and before long Missouri should be "on fire" from end to end.

MONEY FOR FARM LOANS

In the discussion of the Missouri Land Bank provision for which was made by the last Legislature of the state the question is frequently asked "Where will the money come from to make the loans?" Some seem to think that it will be difficult to find buyers for the bonds which are to draw only 4 3-10 per cent interest. As an example of what may be done with the sale of bonds of the State of Missouri we have the recent state capitol bonds which found ready sale to capitalists at approximately 4 per cent. The bonds were drawn at 3½ per cent but a commission was paid for their placement which made them net the purchasers about 4 per cent. The capitol bonds are exempt from taxation which makes them a desirable investment at that rate. In like manner the bonds of the Land Bank will be free from taxes of any kind and drawing 4 3-10 per cent ought to find ready sale in large amounts.

But we have a class of investors within our own state who ought to take a large share of these bonds just as soon as they are made acquainted with the safety, desirability, and negotiability which they will possess. In most every school district in the state a few farmers may be found who have a few hundred or thousands of dollars to loan. Considerable of this money is invested in farm mortgages through loan agencies but recent disclosures of the frauds practiced by these agents as were made known during the last few months in St. Louis, Kansas City and Chillicothe show how unsafe it is for the ordinary man or woman to buy such securities. As soon as the bonds of the Missouri Land Bank are placed on the market backed up as they will be first, by first liens on farm lands double the face value of the bonds; second, by the capital of the bank of $1,000,000; third, by the accumulated reserve saved from the one-half of one per cent annually paid on all loans; and fourth, by the fact that the bonds are issued by a board of the highest officers of the state: these are good and sufficient reasons for believing that farmers, school teachers, laborers, old people and all others who have money to loan or who now have it hid away for safe keeping will be quick to buy these Land Bank bonds.

To show that others take somewhat the same view we reproduce herewith an editorial in a recent number of The Rural New-Yorker, one of the old established papers in this country:

"The French people have raised more than $4,000,000,000 and loaned it to their government. This did not come from bankers and rich men entirely, or even largely. It was raised by people of the thrifty middle class out of comparatively small savings. These Frenchmen have such confidence in their own country that they put up their money and willingly accept government paper in return. At the end of the war with Germany, 35 years ago, the latter country demanded of France a sum of money which seemed far beyond the power of the government to raise. Without question the thrifty Frenchmen of the middle class went to their hiding places and produced the needed money, cheerfully accepting their government's promise to pay. Now they come forward once more with a much larger sum. The people of this country have a great lesson to learn from this. While this nation is still comparatively new, we are already face to face with great needs of capital on the part of farmers. Rural credits are greatly needed in order that deserving men may obtain possession of land and fair equipment. In practically every community, large and small, there is sufficient combined cash and credit to finance the deserving farmers and put them on their feet without going outside to banks and money-lenders. Every year some $300,000,000 is wasted in this country on foolish and wildcat investments. If this money with the millions more tucked away in stockings and clocks and other hiding places could be invested in a liberal and safe system of rural credits the benefit to farmers and to the nation would be beyond calculation. We need more of the thrift and patriotism of the French people. We must learn to combine our capital and credit as farmers, and make it available for other farmers, instead of waiting for the government to do it for us."

A YEAR'S MEAT SUPPLY

If the reader has not already looked over the article on page 5, "The Toll of the Packers" by Judge J. S. Bedford of Boone County, we suggest that he do so right now. Judge Bedford has had many years experience as a feeder and shipper of hogs and cattle and when he tells you the packers are taking a toll of $2 on every hog they buy and $10 on every teer it is about time the farmers should sit up and take notice. One way farmers can save a part of this toll is to follow Judge Bedford's advice and kill more of their hogs on the farm and try to find a market in the nearby towns. A year's meat supply for a whole family and 40 hams to sell for extra profit which Judge Bedford tells you he made by killing 30 hogs, would mean a snug little sum for the state if every farmer would follow this plan. While we are waiting for the organization of packing plants let us begin with these smaller savings right at home.

If organization is a good thing for politicians and packers why not try it out for farmers? There has never been a better time than right now to begin.

Let us begin the New Year right by organizing a farmers' club in every school district in the state.

To the Farmer and Consumer; Isn't it about time you "ditched" your driver?

MISSOURI'S FARM MORTGAGE ACT

There are seven states which have passed comprehensive laws relating to the improvement of farm-mortgage credit. These states are Massachusetts, Missouri, Montana, New York, Oklahoma, Utah and Wisconsin. The laws, however, are of two distinct types. Those of Massachusettes, Utah and Wisconsin seek to reduce the waste in their land-credit systems by improving the methods of making loans and by giving greater mobility to funds seeking safe investment. The laws of Missouri, Montana, New York and Oklahoma, in addition to the above-mentioned aims, seek to make a material reduction in the farmer's rate of interest on mortgage loans. The method proposed for bringing this about is either through the organization of a central land bank or by means of definite state aid.

If the laws of the four last-mentioned states succeed in accomplishing their objects, the farmer's rate of interest on long-time mortgage loans will be about 6 per cent in Montana and Oklahoma, and 5 per cent or a little less in Missouri and New York. Since these interest rates are one or two per cent lower than current mortgage rates in the respective states, it can readily be seen it means something to farmers to have these laws in operation. The question is: What are Missouri's farmers going to do about it?

The Act of Missouri can not under any circumstances become effective until December 1, 1916. In the meantime the Act itself is being carefully scrutinized for any possible defects. Should these appear in the course of time, the constitutional amendment which the people of Missouri are to pass upon next fall provides for their correction. The amendment, if adopted, authorizes the creation of the Missouri State Land Bank, a state loan of one million dollars to the bank, and the exemption from "state, county and municipal taxes the assets of said Missouri State Land Bank and all debenture bonds issued by it." For the improvement of the Act, in case this may be necessary in the future, the amendment also provides that the Missouri Legislature may at any time enact a law or laws "to amend and improve the said act, or to supply omissions or correct errors or defects therein."

Evidently, then, with these wise provisions for the future of farm-mortgage legislation in Missouri, the first thing to be done is to bend every effort to pass the constitutional amendment. Should this amedment be voted down, the possibility of enacting a law to improve farm lands and encourage agriculture in Missouri will not be very encouraging for a long time to come. If there is need to improve farm-mortgage credit conditions—and this need is now quite generally recognized—the Gardner Land Bank offers to farmers the first practical opportunity of a lifetime to bring this about.

Through this bank loans are to be made to farmers at 4 3-10 per cent interest. To this must be added a charge of ½ of 1 per cent for the reserve fund. This latter charge may, at the option of the bank, be refunded to the borrower on the full payment of his debt. Loans are to be made on the amortization plan—that is, the farmer who borrows selects how long a time his loan shall run and he pays in to the bank on his debt a certain sum every year as interest and part of the principal. When the time has been accomplished the debt is removed without the farmer hardly realizing it. The fear of foreclosure is practically removed; the charge on the first farm loans will not be more than 4 4-5 per cent; and the payments are not burdensome. These are the great advantages to the farmers of Missouri if this Act should become operative. It is my conviction no greater good can come to the State of Missouri as a whole than would come by passing this amendment.—James B. Morman, Author of "The Principles of Rural Credits."

Editor's Comment: The above statement comes from a recognized authority on rural credits and we commend what Mr. Morman has to say to our readers. We have probably covered the same ground a number of times within the several months we have been discussing this subject but when such authorities as Mr. Morman and Mr. Mead, whose article appeared in our last issue, substantiate our position we are assured that the fight The Missouri Farmer has made for the Gardner Land Bank Bill is along sound and conservative lines. Farmers had better wake up and help put into operation a real farmers' measure or we may wake up to the fact some day that Congress or the Legislature has put into effect some Act more in the interest of the lender than of the borrower.

BUCKSHOT BY THE PROFESSOR

Here goes a Happy New Year to the whole bunuch of you. May the good Lord bless you and yours with good health and a few little chunks of prosperity is the ardent wish of the "fool professer feller."

My wife has asked me to get a divorce from my old cob pipe and I suppose I'll have to do it. You never can tell where or when these womans suffrage symptoms are going to break out.

The trouble with a lot of people in this World is that they are just trying to "get by." That's why we have so many shiftless farmers, so many poor rural schools, so many "bum" doctors and lawyers, so many out of date merchants—and it's because there are so many "bum" preachers that our "rural churches are decayin" and no longer a power in the community.

Did you notice how that fellow, "Old Jim Riley" busted into this paper in the last issue? And what made me still more sore is that he was perched right on top of my stuff. I didn't think the editor would let him do it. He's been jealous of my writing for the paper for a long while and I knew he'd try to break in sooner or later. He belongs in the "long green squad" down at old "Hez" Brown's store—not in a respectable farm paper like this. There are a lot of things I know about him and if he ever gets on top of my stuff again, I'll speak right out in meetin'. There are some things I wont stand for—so let him watch out.

Here's hoping, brother, that you will remember the main thing in that little "Christmas Prayer" which appeared on the front page of the last issue—and that is to "be a little more thoughtful of the health and welfare of your wife and to speak more gently and kindly to her in the year to come." "Getting right down to brass tacks, it is your duty and mine to make the lot of the woman who is fighting life's battles with us hand in hand just as happy as possible. Now don't you think so? I would rather be any kind of a coward in the World than a coward who is unkind to his wife—for of all the measly, underhanded cowards on Earth such a man is the worst.

Why not start the new year by organizing a Farm Club in your school district? Why not "light up the little school house" and you and your neighbors contribute your share in the great fight to lick the Packers and a lot of other horsethieves who are robbing the farmer? I believe in doing something—even if I can't do better than to jump straight up and down.

There are a pile of farmers who are "not dead but only sleeping." They are the kind who don't believe "farmers will ever stick together"—and they get their "hunch" from the fact that they have hardly got energy enough to stick together themselves. If the good Lord hadn't joined them together in the first place they would put in three-fourths of the time hunting for their legs and hands.

Here's hoping you will sort of square things up with your conscience by sending this paper a dollar to renew your subscription and thus contribute your share toward the great fight it is making in the interest of the farmers of this state. Don't say "I never subscribed for the paper in the first place," etc. What difference does that make? While other farm papers are trying to knife the Land Bank Bill which will give the farmers of this state cheaper and longer time money than they have ever had before, this paper is working "teeth and toe nail" to carry the necessary amendment at the coming election—but it must have money to live and when it offers you three whole years subscription—and also to wipe out all the past due subscription—for the small sum of one dollar, don't you think all of us ought to "chalk up" and show that we are willing to stand by our real friends? I don't want to make you "sore" and yet I mean every word I say. Too many of us are thoughtless. We don't stick by the men who offer to help us—and then we wonder why it is so hard to pay off the mortgage. As a rule, men of ability—men who know how to fight—are on the other side because the other side is willing to pay them and doesn't make them starve to death. This is the big reason why so few men are fighting the battles of the farmer.

The "long green squad" and the "dry goods box brigade" down at "Hez" Brown's store switched from the Navy over to the Mexican situation the other day because "Jep" Thompson allowed that "we kin take that up again along in March or April and then beat Congress in gettin at the propper solvin' of the problem." At this stage of the game old "Chouce" Baker broke in with, "Congruss nuthin. Congruss don't solve nuthin. What them senators and congrussmen will do is to find out first what 'Possum Holler and Coon Gulch think about it. If 'Possum Holler and Coon Gulch want a lot o' dreadnaughts, why that's what we'll git. If they want a lot of skiffs and canoes and bows and arrows, why that's what we'll git. Congruss nuthin. Why if I wanted to start out to hunt genyewine opinions and backbones I'd dig up a lot of fishin' worms. I wouldn't expect to find either one in a congrussman." Well, anyhow," said "Jep," tired like, "what's that got to do with this Mexican business? You remind me of an old coon dog I've got that always goes away pell mell after a rabbit just about the time I tree a coon. Now I am for this feller Carranzy because he looks to me like a feller that's got a lot of statesmanship to him." "You mean a lot of whiskers" broke in "Chouce" disgustedly. "If that old greaser was to ever go an' git a hair cut an' a shave there wouldn't be as much of him left as a good sized medder lark. Who ever heard of a fellow with that kind of a crop of Alfalfy growin' out of his face bein' a statesman?"—and at this old "Hump" Jones, who has a long billy goat beard of his own, got so excited he almost swallowed his long green and shouted. "Now if your aimin' that whisker stuff at me I'll mop up the middle of the street with you,'" when old "Hez" interfered and said, "Now be cam genlmen, be cam."

By Old Jim Riley

Well, Woodrow has been off on his honeymoon, the congressmen have been home repairin' their fences, the Potomac is froze up, old Carranza is quietly writin' about Constitutional guvment, the boys have been havin' Crismus trees in the trenches and if it hadn't a bin for that fight among the delegates on Henry Ford's "Peace Ship" there wouldn't have bin anything much stirrin' durin' the holidays. Talkin' about automobiles, I see where another one of them concerns has declared a dividend of 100 per cent—and the more I think of it the better I like my old gray mule.

Biggest Hatches

Bad luck and side or end heating plants go hand-in-hand. X-Ray Duplex Central Heating Plant—directly underneath—where it ought to be—chases bad luck and gives *biggest hatches.*

X-Ray Incubators

and Brooders too are scientifically correct in every detail. *One gallon of oil—only one filling*—for the entire hatch. X-Ray Hinged Glass Top—X-Ray Ventilating System—X-Ray Automatic Trip (heat regulator)—are some of the X-Ray fifteen special features. *Express prepaid* to practically all points. Send postal for free book No. 81.

Box 81, Des Moines, Iowa

90 bu. per acre from stump land!

When David Bennison of Iowa bought a sixty acre tract of Cypress covered land near New Madrid, in

Southeast Missouri along the Cotton Belt Route

the neighbors laughed at him. But Bennison knew **good** corn land. He cleared that tract, planted corn, and the first yield—grown among stumps—brought 90 bu. per acre. The wonderful depth and fertility of soil there is amazing. 90 bu. per acre there is better than average but not uncommon. Mr. Mahoney of Dexter, Mo. says "Last year our corn yielded 75 bu. per acre. We have made 90 bu. and it will run above 60 bu. an acre year in and year out". Mr. Hunter of New Madrid says many of his fields of corn average 80, 90 and 100 bu. per acre. There isn't a richer soil in America than that in Southeast Missouri.

There isn't a section anywhere where you can buy rich land so cheap that the first **staple, field** crop will pay for its cost and clearing (if you buy unimproved). And that rich soil makes wonderful yields of **anything.** C. D. DeField of East Prairie says "We cut our alfalfa every 28 days; five times a season. It averages a ton per cutting. Clover does well; in fact any kind of feed or pasture, I raised 40 mules last year without doing **any winter feeding** at all. Cattle and hogs go through winter here without feeding." 90 bu. per acre corn land at $35 will go quick; act!

Free book—illustrated!

A farmer wrote it; and he knows what you want to know about a section new to you. Tells about character and cost of lands, climate crops raised, etc., and about schools, churches, towns, social conditions. Brimful of actual photograph pictures "taken on the ground." The Plunderer

By ROY NORTON

Author of "The Garden of Fate"

(Continued from last issue)

"Wolff," said the old millman, steadily, "we are looking for the man that blew up the Croix d'Or powerhouse and dam last night. And what's more, we think we've got him. You're the man, all right!"

His attempts to pretend ignorance and innocence were pitiful. This impromptu court was trying him there in the open beside the cabin, and he knew that its verdict would be a speedy one. He started to run the gamut of appeal, denial, and anger; but his hearers were inflexible. They silenced him at last.

"We need just one thing more, boys," said Rogers, "and that is to be sure that these are the same boots that made the tracks there by the dam. All we have to do to prove that is to take this fellow back with us. The tracks will still be there. If they are the same we can be sure."

"That's right," added the blacksmith. "That'd be proof enough. Let's move out."

They knotted their huge handkerchiefs and bound his arms at the elbows and then his hands at the wrists, and started him forward. He fought at first, but on being prodded sharply with the muzzle of a gun moved sullenly in their midst along the trail he had so lately come over. They trudged in a harsh silence, save now and then when he tried to persuade them of his innocence, only to convince them further that he lied. Their return was made much faster than their coming, for now they had no need to seek a trail, nor to walk in a mountain stream. They forged ahead rapidly under the direction of the runner who had been in that part of the mountains before, and yet it was almost dusk when they came down the hill above the great wreck. They led him to the big heap of broken masonry and then ordered him to sit down. He had to be thrown from his feet, after which they removed his shoes, and while two of them stood guard over him the others descended to the edge of the wall and found the clear-cut prints which had been first noted that morning and which, trailed, had led to his capture. They struck matches to be certain that there was no mistake and bent over while Rogers carefully pressed one of the shoes into the mud beside that first imprint. They were undoubtedly the same. He then fitted the shoe into that track, and all further proof was unnecessary. Grimly they passed back to where Wolff was being guarded.

"Well, boys," said Rogers, gravely. "this is the man! There isn't a doubt of it. Now you all know who he is, what his past has been, what he has done here, and I want to get your ideas what should be done with him."

The smith stepped forward and took off his hat. It was as if he knew that he were the one to impose a death sentence.

"There ain't but one thing for the likes of him. That's hangin'," he declared, steadily. "I vote to hang him. Here and now, across the end of the dam he shot out."

He stepped back into the closely drawn circle. Rogers faced man after man, calling the name of each. There was no dissenting voice. The verdict was unanimous. So certain had been the outcome that one of their number had started along the pipe line to the wreck of the powerhouse for a rope before ever they compared the imprints of the tell tale shoes, and now, almost by the time they had cast their ballot, this man returned.

"Wolff, you've heard," said the old millman, with solemnity. "If you've got any messages you want sent, we'll send them. If you want time to pray, this is your chance. There's nothing you can say is going to change it. You are as good as dead. Boys, some of you get one of those beams that's tore loose there at the side, fasten the rope around the end, and shove it over the edge of the wall above the cannon there for a few feet. He shall hang above the dam he dynamited."

Wolff knew that they were in earnest. There was something more inexorable in their actions than in a court of law. At the last he showed some courage of a brute kind, reviling them all, sputtering forth his hatred, and interlarding it with a confession and threats of what he wanted to do. They silenced him by leading him to the wall and adjusting the noose. Once more Rogers besought him to pray and then, when he again burst into oaths, they thrust him off. The fall was as effective as ever hangman devised.

"In the morning, boys," said the smith, "a half-dozen of us must be up early and come back here. The hound is at least entitled to a half-way descent burial. I'll call some of you to come with me."

That was their sole comment. They had neither regrets, compunctions, nor rancor. They had finished their task according to their own ideas of justice, without hesitation.

At the Croix d'Or the partners, worried over their problems, and somewhat astonished at the non-appearance of the force, sat on the bench by the mess-house, smoking and silent.

In soft cadence they heard, as from the opposite side of the gulch, the tramping of feet. Swinging along in the dusk the men came, shadowy, unhalting, and homeward bound, like so many tired hounds returning after the day's hunt. Their march led them past the bench; but they did not look up. There was an unusual gravity in their silence, a pronounced earnestness in their attitude.

"Well," called Dick, "what did you learn?"

It was the smith who answered, but the others never halted, continuing that slow march to the bunk-house.

"We got him."

"Where is he, then?"

"Hanging to a beam across the dam he blew up," was the remorseless response.

He started as if to proceed after the others, then paused long enough to add: "It was that feller that used to be watchman here; the feller that tried to shoot Bill that night. Found him in that old, deserted cabin near the Potlach. Had the shoe on him, and at last said he did it, and was sorry for just one thing, that he didn't get all of us. Said he'd 'a' blown the bunkhouse and the office up in a week more, and that he'd tried to get you two with a bowlder and had killed your burros—well, when we swung him off, he was still cursing every one and everything connected with the Croix d'Or."

He paused for an instant, then came closer, and lowered his voice.

"And that ain't all. He said just before he went off—just like this—mind you: 'I'd 'a' got Bully Presby, too, because he didn't treat me fair, after me doin' my best and a-keepin' my mouth shut about what I know of the big lead.' Now, what in hell do you suppose he meant by that?"

CHAPTER XIV

"THOUGH LOVE SAY NAY"

"Of one thing I am sure," said Dick on the following day, when they began to readjust themselves for a decision, "and that is that if we can find work for them, there isn't a man on the works that I don't want to keep. They are too true and loyal to lose."

"We could drive into the blacksmith's tunnel," Bill said; "and I've an idea we might strike something when we pass under that hard cone just above—well, just about under where Bells is. I saw it yesterday when we were up there for the first time. That would give the millman and his gang something to do. Some of 'em can take out the rest of the green lead, and after that drift see if it comes in again. And the others that can't do anything underground, can turn to and build up the dam, with a few masons to help, and, when a new wheel comes, the millman will know how to set that all right again. So, you see, we don't have to lose any of them that has stood by us, so long as Sloan is ready to take his gamble and the hundred thousand lasts. Before that's gone, we'll just have to make good. And somehow I feel we will."

As if to add to the mental trials of the half-owner of the Croix d'Or, but another day elapsed after this decision and adjustment before he received a letter from a Seattle broker offering him a price for his interest in the mine. Thus wrote the agent:

"My client has the timber and water rights of your property in view more than anything underground, which, on the advice of experts who have visited the property in previous years, he seems to regard as worthless. He informs me that you are, to all intents, representing not only your own interest, but that of the other partner, who places implicit confidence in you. I presume that you will therefore be amenable to doing all you can to save from the wreckage of the dead property all that is possible in behalf of that partner as well as yourself, and I am authorized to make you the extremely liberal offer of sixty thousand dollars for the full title to the property."

The price was ridiculously low, and Dick knew it; yet if the mine produced nothing more, and was, as the experts were supposed to have reported, worthless, the amount was extremely liberal. But for Bill he would have hesitated to decline such an offer. That worthy, however, threw his head back and roared derisively.

"Sixty thousand? Sixty thousand? What does that idiot think men who have dropped a quarter of a million in a property would quit for? Does he think that sixty thousand is any saving from the wreck that this has been? Tell him to chase himself—that the tail goes with the hide, and you'll quit clean whipped, or not at all."

But Dick was loath to refuse any offer without consulting his superior in New York, and accordingly wandered off into the hills to think. It was late in the afternoon, and he mechanically tramped over the trail to the pipe line, where, when hope ran higher, he had dared to dream.

The whole situation had become a nerve-racking tragedy of mind and action. His desperate desire for success after his self-acknowledment that he loved Miss Presby, and then the blows that had been rained on him and the mine, the failure of the green lead to hold out when it had at least promised and justified operation—all cumulated into a disheartening climax which was testing his fortitude as it had never been tried before. He was not of those who lack either persistence, determination, or moral bravery; and it was this last characteristic, coupled with a certain maturing caution, which made him question the honesty of proceeding to lay out, perhaps, the entire hundred thousand volunteered by Sloan, with such little certainty of returns. Had the money been his own, he would have taken the chances uncomplainingly; but his judgment told him that, had he been sent to the Croix d'Or as an expert to pass an opinion on the justification of putting a hundred thousand into the ground, under present conditions, he would have advised agaist it.

He went as far as the reservoir. Its wreckage seemed to mock his efforts. To rebuild it alone meant big expense in a country where every barrel of cement had to be brought in on the backs of pack mules, and where stone masons received unduly high wages The repairs to the plant would not prove so heavy; but after that? None knew better than he the trials of expensive prospecting underground, the long drives to end in nothing, the drifts that tapped no ore, the ledges that promised to come in strongly, and led the worker on with hope deferred until his purse was exhausted. The cruelty of nature itself flaunting the golden will-o'-the-wisp in the blackness of the earth.

He stood on a timber thrown carelessly on the brink of the gorge, and suddenly thought how it happened to be there, and for what tragic purpose it had served—a gallows. He shuddered, thinking of the mentally distorted wretch who had died at its end, cursing as the men of the Cross pushed him over to gasp and wrench his life away fifty feet above the ruin he had wrought. He wondered where the man had been buried, and hurried back along the pipe line to try and forget that episode.

A little flutter of white from a clump of brush attracted his eyes, and he extracted from the brambles a dainty handkerchief still fragrant with the personality of the girl he loved. He lifted it to his lips tightly, and, with a heart that was almost in pain, dropped to the line, and sat on the pipe, bent, and utterly dejected. He sat there for some minutes, and then a sound caused him to straighten himself with a jerk. The black horse was thundering down the hill as he had seen it on those other mornings when, looking backward, the "world was young."

"I saw you, Mr. Townsend," Miss Presby said as he assisted her to alight; and her voice was sympathetic and grave. "You are unhappy. I don't blame you. I have heard all about it, and—well, I have had to fight an hourly impulse to come to you ever since I heard the news. Oh, my friend, believe me, I am so sorry! So sorry!"

He could not reply, lest his voice betray the emotions aroused by her kindly sympathy. All his yearnings were fanned to flame by the cadence of her voice and the softness of her eyes. Mechanically he resumed his place on the pipe, and she seated herself by his side, half-facing him. Her slender foot, booted, braced against the ground, and almost touching his heavy miner's boot, tapped its toe on the sward as if she were impatient to find words.

"It has been a little tough," he said; "but it seems less hard to me now that I know you care."

He had blundered in his first words to the beginning of dangerous heights, and his pulses gave a wild throb when he glanced up at her and saw a light in her face, in her eyes, in her whole attitude, that he had never surprised there before. Words, unuttered, leaped hotly from his heart; a mad desire to tell of his love, of the visions he had seen in the air, on the blue of the peaks, in the cool shadows of the forests, in the black depths hundreds of feet under the ground. Of how the Croix d'Or had come to represent, not financial success, but a battle for her, and her love.

His face went white, and he bit his dry, twisted lips, and clenched his hands until they hurt.

"Not now!" he savagely commanded himself. "Not now!"

She appeared to be thinking of something she had to say, and her first words rendered him thankful that he had held his tongue, otherwise he might never have known the depths o the girl seated there by his side.

"I don't want you to think me forward," she said quietly; "but I have wanted for the last two days to ask you something. It makes it easier now that I know you know, that—that I care for it. What are your—your—how are your finances?"

She had stammered it out at last, and, now that the conversation had been led in that direction he could speak. He sat there quietly, as if by a comrade, and told her all. Told her of his boyhood, his father's death, and that he, in his own rigt, had nothing in the world but youth and a half-ownership in the Croix d'Or, which threatened to prove worthless. He voiced that dread of wasting his backer's money when he had none of his own to put with it, meeting dollar for dollar as it was thrown into the crucibles of fate. He stopped at last, a little ashamed of having so completely unbosomed himself, for he was by habit and nature reticent.

"You have made it a great deal easier for me," she said, with an assumption of gayety. "I can say what I've been thinking of for two days without spludging all over my words."

She laughed as if in recollection of her previous embarrassment, and again became seriously grave, and went on:

"They say my father is a hard man. At times I have been led to believe it; but he has been a good father to me, and I appreciate it and his worries more, after a four years' absence in an Eastern school, and—well, perhaps because I am so much older now, and better able to judge leniently. I have never known much of his business from his lips. It is one subject on which he is not exactly loquacious, as probably you know."

Again she laughed a little, grim

laugh. Dick had opened his lips to say that he had never met her father, when she continued:

"On the day I met you first, up here by your pipe line, the day you almost ended my bright young career by starting a half-ton bowlder down the hill—don't interrupt with repeated apologies, please—I had my birth anniversary. I was twenty-one, and—my own boss."

"Congratulations, belated, but fervent."

"Thank you; but you again interrupt. On that day when I went home, my father, in his customary gruff way, turned back just as he was going to the office where he lives at least eighteen hours out of every twenty-four, and threw in my lap a bank-book. 'Joan,' he said, "you're of age now. That's for you. It's all yours, to do just what you dam' please with. I have nothing to do with it. If you make a fool use of it, it'll be your fault, not mine. I'm giving it to you so that if anything happened to me, or the Rattler, you'd not be helplessly busted.'"

He jumped to his feet with an exclamation.

"The Rattler! The Rattler! And—and your name is Joan and not Dorothy, and you are Bully Presby's daughter?"

He was bewildered by surprise.

"Why, yes. Certainly! Didn't you know that—all this time?"

"No!" he blurted. "There is a Dorothy Presby, and a——"

"Dorothy Presby!" She doubled over in a gust of mirth. "The daughter of the lumberman over on the other side. Oh, this is too good to keep! I must tell her the next time I see her. After all these months, you still thought——"

Again her laughter overwhelmed her; but it was not shared by Dick, who stood above her on the slope, frowning in perplexity, thinking of the strange blunder into which he had been led by the words of poor old Bells, his acceptance of her identity, his ignorance that Bully Presby had kith or kin, and of the mine owner's sarcastic references and veiled antagonism throughout all those troubled months preceding.

If she were Bully Presby's daughter, he might never gain her father's consent, though the Croix d'Or were in the list of producers. He thought of that harsh encounter on the trail, and his assertion that he was capable of attending to his own business and asked neither friendship nor favor from any man under the skies; of Bully Presby's gruff reply, and of their passing each other a second time in the streets of Goldpan, without recognition. The girl in front of him, so unlike her father save for the firm chin and capable brow, did not appear to sense his perturbation.

"Well," she said, "it doesn't matter. I am not jeal—— I'm not any different—just the same. Come back here and sit down, please, while I go ahead with what I wish to say."

The interlude appeared to have rendered her more self-possessed.

"So, on that day I met you, I became quite rich. That money has rested in a bank, doing neither me nor any one else any benefit. I think I have drawn one check, for twenty-five dollars, just to convince myself that it was all reality. And I am, in some ways, the daughter of my father. I want my money to work. I'm quite a greedy young person, you see. I want to lend you as much of that money as you need."

"Impossible!"

"Not at all. I have as much faith in you, perhaps more, than this Mister Sloan, of whom I'm a trifle jealous. I want to have a share in your success. I want to make you feel that, even if I'm not the daughter of a lumberman, I am, and shall have a right to be, interested in—in—the Croix d'Or."

"Impossible!"

"It isn't any such thing. I mean it!"

"Then it's because I haven't made it plain to you—haven't made you understand that even now I am thinking, to preserve my honor, of telling Mr. Sloan that it is too much of a venture. If I should decline to venture his money, why should I——?"

"Refuse mine? That's just it. His money you could decline. He isn't on the ground. He doesn't know mines, mining, or miners. I know them all. I am here. I know the history of the Cross from the day it made its first mill run. I went five hundred feet under ground in a California mine when I was a month old. I've run from the lowest level to the top of the hoist, and from the grillies to the tables, for at least ten years of my life. I've absorbed it. I've lived in it. Had I the strength, there isn't a place in this, or any mine, that I could fill. I'm backing my judgment. The Croix d'Or will prove good with depth. It may never pay until you get it. The blowing of your dam, the loss of your green lead, and all of those troubles, don't amount to that."

She snapped a thumb and forefinger derisively, and went on before he could interject a word, so intent was she on assisting him and encouraging him, and proving to him that her judgment, through knowledge, was better than his.

The name came so easily to her lips! It was the first time he had ever heard her utter it. It swept away his flying restraint even as the flame of powder snaps through a fuse to explosion; and he made a sudden, swinging step toward her, and caught her in his arms savagely, greedily, tenderly fierce. All his love was bursting, molten, to speech; but she lifted both hands and thrust herself away from him.

"Oh, not that!" she said. "Not that! I wish you had not. It robs me of my wish. I wanted you to take my money as a comrade, not as my—— Oh, Dick! Dick! Don't say anything to me now, or do anything now! Please let me have my way. You will win. I know it! The Cross must pay. It shall pay! And when it does, then—then——"

She stood, trembling, and abashed by her own words, before him. Slowly the delicacy of her mind, the romanticism of her dreams, the great, unselfish love within her, fluttering yet valiant, overwhelmed him with a sense of infinite unworthiness and weakness. He took his hat from his head, leaned over, and caught one of the palpitant hands in both his own, and raised it reverently to his lips. It was as if he were paying homage to heaven devoutly.

"I understand," he said softly, still clinging to the fingers, every throb of which struck appealingly on his heartstrings. "Forgive me, and—yet—don't. Joan, little Joan, I can't take your money. It would make me a weakling. But I can make the Cross win. If it never had a chance before, it will have now. It must! God would not let it be otherwise!"

Help me to my horse," she said faintly. "We mustn't talk any more. Let us keep our hopes as they are."

He lifted her lightly to the saddle and the big black, with comprehending eyes, seemed to stand as a statue after she was in her seat. The purple shadows of the mountain twilight were, with a soft and tender haze, tinting the splendid peak above them. Everything was still and hushed, as if attuned to their parting. She leaned low over her saddle to where, as before something sacred, he stood with parted lips, and upturned face, bareheaded, in adoration. Quite slowly she bent down and kissed him full on the lips, and whispered: "God bless you, dear, and keep you—for me!"

The abrupt crashing of a horse's hoofs awoke the echoes and the world again. She was gone; and, for a full minute after the gray old rocks and the shadows had encompassed her, there stood in the purple twilight a man too overcome with happiness to move, to think, to comprehend, to breathe!

Continued in next issue)

After the first of the year we expect to mail out a letter to all delinquent subscribers asking them to kindly renew their subscriptions—and we hope you will renew yours at once so we can save the postage. It takes thousands of dollars every year to run a publication like The Missouri Farmer—and we must either get it from our subscribers or go in debt. Here's hoping, my friend, that you will be willing to "put your shoulder to the wheel" and help out your mite.

Home Makers Conference

This Department is Edited by Miss Alice Kinney, New Franklin, Mo.

STATE OFFICERS

President, Mrs. Harry Sneed, Sedalia.
First V. P., Miss Louise Stanley, Columbia
Second V. P., Mrs. Horace Windsor, Boonville.
Cor. Sec., Miss Bab Bell, Columbia.
Rec. Sec., Mrs. D. H. Doane, Columbia.
Exec. Sec., Miss May McDonald, Columbia
Treas., Miss Ivan W. Philips, Kingville.

ADVISORY BOARD

Mrs. N. H. Gentry, Sedalia.
Mrs. Marie T. Harvey, Kirksville.
Mrs. F. B. Mumford, Columbia.
Mrs. R. E. Shyrock, Kansas City.
Mrs. J. E. Roberts, Maysville.

"She walks—the lady of my delight—
A shepherdess of sheep.
Her flocks are thoughts. She keeps them white;
She guards them from the steep.
She feeds them on the fragrant height,
And folds them in for sleep."

HOME

A man may build a mansion
And furnish it throughout;
A man can build a palace,
With lofty walls and stout,
A man can build a temple,
With high and spacious dome,
But no man in the world can build
That precious thing called home.

It is the happy faculty
Of woman, far and wide,
To turn a cot or palace
Into something else beside—
Where brothers, sons and husbands, tired,
With willing footsteps come—
A place of rest, where love abounds,
A perfect kingdom—Home.

The Neighborhood Progressive Club

It is with great pride that we publish the following report of our first affiliated club:

"We organized April 16th with fourteen active members and eleven honorary members. One of our active members later moved into another neighborhood and joined their club.

We hold our sessions the first and third Wednesdays of each month. Our program committee provides us with various topics, some are literary, some are humorous while several have been taken from the programs as outlined in bulletin "Homemaking in Missouri."

In May we had the pleasure of havig Miss May McDonald with us. She spoke on the ready help that the University of Missouri is offering to rural clubs.

It was our good fortune also to have Miss Addie Root, who told us of the great effort that is being made in behalf of the girls of our state.

During June we gave a social entertainment, inviting our friends to a lawn party. The men seemed to enjoy our social gathering very much and are interested in the club and what we are doing. We are hoping that they will organize in the near future.

Miss Carrie Pancoast came to us in October and gave the club such interesting and instructive demonstrations of the work done in the movable schools of Home Economics, which was highly enjoyed by visitors and members, one and all join hoping that Miss Pancoast will soon come our w again. Our visitors were so deeply impressed with our work that they have organized a club in their neighborhood.

The Hallowe'en supper was our opportunity to combine pleasure and business, we served oyster stew, pickles, pumpkin pies, doughnuts and coffee. While the public was invited we charged twenty-five cents for each person and cleared $20.70; this, with our regular dues of five cents per month of active members gives us $22 in our treasury.

We are planning to buy some books and start a library. We have subscribed for a good magazine and The Missouri Farmer comes regularly and is greatly enjoyed. Suggestions for our library would be highly appreciated.

Mr. A. J. Meyer, of the Agricultural Extension Service, gave us a most interesting talk on the Community Club and its advantages. At this meeting which was in the nature of a social, we entertained the husbands and sons of our club members.

We have no one in the contest for the "Hall Prize."

We are very, very glad that we affiliated with the Home-Makers' Conference and we would like to hear of many other clubs doing the same.

We call ourselves the Neighborhood Progressive Club" and marvel how we ever existed without it.

Mrs. G. L. Denham, Pres.
Miss Nadine Brooks, Sec'y.

For Better Babies

The Baby Week idea originated in Chicago not quite two years ago. Then New York had a Baby Week, and Pittsburg, and other cities. Such practical benefit has in each case resulted that the General Federation of Women's Clubs has undertaken to promote this nation-wide observance. State health officials and national organizations interested in public health and child welfare have taken up the plan and in various ways are giving it not only their sanction but their active co-operation. The extension divisions of the state universities have promised special assistance in interesting and helping Baby Week in rural communities.

The Federal Children's Bureau believes that Baby Week will give more parents a chance to learn the accepted principles of infant care, and will awaken every American to his responsibility for the deaths of the three hundred thousand babies who, according to the Census estimates, die every year before they are twelve months old. Therefore the Children's Bureau has prepared a special bulletin of practical suggestions for Baby Week campaigns, adapted to the varying needs of communities of different types. Copies of this bulletin may be had free of charge from the Children's Bureau at Washington.

Rural Children—Three-Fifths of All

"Three-fifths of the 30,000,000 children in the United States are rural children. What are the facts as to rural child welfare? They are not known. But it is noteworthy that the percentage of illiteracy in rural communities, according to the 1910 census, is double that in cities. Where the rural child labor is great, the percentage of child illiteracy is high. The juvenile delinquency laws on the statute books of most of our states are ineffective over the greater part of those states because rural probation officers are lacking; and the figures of correctional institutions show that the country is largely represented.

"Time and money are required to secure the facts about the physical, social, and economic conditions surrounding rural children, but these conditions must be understood if we are to be sure that we are making progress in securing a fair chance for every child."

"As a general rule compulsory school attendance ceases at the age of 14, the crucial point of maturing life, which educator and physiologist well know to be the most critical period of growth. Yesterday great authorities were experimenting on the best methods of training their minds, of developing their bodily powers. Today the same children are beyond the reach of all this costly solicitude—they have gone to work."

After quoting the opinion of various scientists, the report of the United States Children's Bureau contiues: "Full and intelligent protection of the physique and mental powers of the youthful workers of this country requires costly and laborious studies in laboratory and in workshop. The Children's Bureau desires to submit the reasonableness of spending mone to make them so that we may secure just standards for the use of labor, as new standards for material are being developed."

GREEN FEED FOR POULTRY

Green feeds for poultry contain only a small percentage of actual food nutrients, but are important because of their succulence and bulk, which lighten the grain rations and assist in keeping the birds in good condition. The poultryman should secure a sufficient supply of such feeds to last through the winter months in sections where growing green feeds can not be obtained. When chickens are fattened without the use of milk, green feed helps to keep them in good condition.

Cabbages, mangel wurzels, clover, alfalfa, and sprouted oats are the green feeds commonly used during the winter. Cabbages do not keep as well in ordinary cellars as mangel wurzels, so where both of these feeds are available the cabbages are fed first. They are often suspended, while the mangel wurzels are split and stuck on a nail on the wall of the pen. Clover and alfalfa may be fed as hay, cut into one-half to 1 inch lengths, or may be bought in the form of meal. Alfalfa meal has a feeding analysis equal to bran, but is not as digestible on account of its larger percentage of fiber. Clover and alfalfa should be cut while slightly immature, if they are to be cured and fed to poultry. The leaves and chaff from such hay are especially adapted for poultry feeding.

Sprouted oats make a very good green feed and are used quite extensively in this country. The oats can be soaked for 12 hours in warm water and then spread out in a layer of from one-half to one and one-half inches deep on a floor, or in a tray or tier of flats, which have openings or holes or a three-sixteenths (3-16) inch mesh wire bottom, so that the water drains freely. They may be stirred daily and sprinkled, or allowed to sprout without stirring, until ready for feeding. They are usually fed when the sprouts are from 1 to 1½ inches long, although some poultrymen prefer to allow the sprouts to grow to 2 or 3 inches long. Oats need a moist and warm atmosphere in which to sprout quickly, so that it is necessary to furnish heat or to keep them in a warm room during the winter, while they may be sprouted out of doors during the rest of the year. It takes from 6 to 10 days to sprout oats, depending on the temperature of the room. Oats frequently become moldy while sprouting. To prevent this, they may be treated with formalin, using 1 pint of formalin to 30 gallons of water, which is sprinkled over and thoroughly mixed with 30 bushels of oats. Cover the oats with a blanket for 24 hours; then stir until they are dry. Keep them in a sack which has also been soaked in formalin. Oats thus treated and dried may be held for a long time for sprouting.

Where the double-yard system of confining poultry is used, one of the yards is kept in green feed, into which the hens are turned when the crop attains a height of 4 or 5 inches. This method of alternately yarding poultry furnishes green feed for the birds and at the same time freshens the yard. Rape, wheat, rye, oats, and barley are usually sown for this purpose. Rye is good for late fall and early spring feeding, as it will live through the winter in most sections. Oats, wheat and barley are used throughout the spring, summer, and early fall. Several of these grains may be sown together to secure a greater variety of green feed, and any quick-growing grains may be used for this purpose. —U. S. Department of Agriculture.

EXAMINE EGGS TWICE IN HATCHING PERIOD

All eggs that are incubating should be examined twice during the hatching period. The poultry husbandman of Clemson College suggests using for this purpose an egg tester that can be made from an ordinary mailing tube in the manner he describes. H prepares a double thickness of heavy brown paper 4 inches square, puts one end of the mailing tube at the center of the square of paper, and doubles the edges of the paper over it, so as to form a paper cap. He fastens the cap with three wrappings of cord and, finally, cuts a hole one inch in diameter in the top of the cap.

The free end of this tube is placed at the eye and the egg to be examined is pressed lengthwise against the hole in the cap. Point the tester toward the sun or a bright light and you will be able to see the contents of the egg plainly. The cap acts as a cushion between the egg and the end of the mailing tube and prevents light from entering the interior of the tube around the sides of the egg.

The first test is made at the end of the first week of incubation. A fertile egg with a live germ in it has a dark spot (the embryo or young chick) in the upper part of the egg, with veins radiating from it. Gently twirl the egg and you will see the germ move. Such an egg is to be returned to the incubator or hen. Clear eggs (infertile), eggs with rings of blood (embryos that grew for a few hours and died), eggs with dark spots, but no veins (dead embryos), and clouded eggs are to be removed and destroyed. As an exception, the clear, infertile eggs may be kept and boiled hard for chick feed.

The second test is made at the end of the second week. At this stage, a live embryo darkens the entire egg, except the air cell in the larger end. Eggs appearing otherwise are rejected.

One of the chief objects in testing eggs during incubation is to remove the dead and decaying eggs from under two hens and place all the good eggs under one, resetting the other.

LYON'S PRACTICAL FARM PAPERS

Real winter came on us December 9 and lasted a week, then came two days hard rain and another freeze up. While few of The Missouri Farmer readers are tobacco growers, many will be interested to know some things about the crop, and I may say, that at this season those who grow the weed are busy stripping it out. This work is done in "stripping rooms," our own being 12 x 22 feet in the northeast corner of a barn, all cracks in the outside being battened closely and the entire wall surface lined with blue plaster board. There is about 60 square feet of glass at the north side, and in one corner a stove, so that we can work comfortably even in zero weather.

Tobacco is asserted into three primary classes, 'trash," "lugs" and "leaf," and each of these into three to five grades, according to length, color and texture. Here we seldom get a crop without some green, bruised, worm eaten, sun-burned or house-burned leaf in it, and each of these should be kept separate. The most valuable part of the crop is known to the trade as cigarette filler and wrapper, these two classes being worth almost double the price of other kinds. Some cigarette wrapper has been sold on the market this year at 40 cents per pound, and as we think we have at least 500 pounds of this class in our crop of some 7,000 to 7,500 pounds, we are using special care to see that we do a good job handling. A little carelessness could allow most of this high-priced leaf to be scattered through the other grades, and in the end only bring us 10 to 15 cents per pound, and lose us fully $100.

Tobacco grading is a trade of its own, and my two sons are as good graders as I used to be before my eyes began to fail me, but still I am able to do a good lot of work at the stripping bench.

Our tobacco is either sold to speculators at a stated price "all 'round," or through the "Loose Leaf Markets," immense auction warehouse, located in almost every town. While the fact is denied, these "Loose Leaf" houses are practically managed by the tobacco trust, and prices are arbitrarily set, despite quality, supply, demand or anything else, most local speculators being such in name only, simply the agents for the grand masters of finance, who could pay double present prices and then make 100 per cent.

Twenty years and more ago, farmers did not deliver their tobacco until from May to July, keeping it in large bulks, until it had sweated naturally. Now delivery is over by April 1, the tobacco is redried under heat nearly strong enough to scorch it, and beyond doubt much of it is manufactured and in consumers' hands by March 1.

Old chewers notice the fact that they no longer get tobacco with any flavor to it, something that is due to the tobacco never having been through the sweat, which is one of nature's processes, and without which no fine tobacco flavor is developed.

The average prices at loose leaf markets so far this year are below 10 cents per pound, but little really good tobacco has been offered yet—the few good crops on the market selling up to 16 cents and the worst crops bringing 7 cents per pound.

The crop is a very short one, and were it not for the trust, it would average its producers at least 15 cents per pound. C. D. Lyon.

THE FARMERS' MARKET CLUB

No finer service has ever been proposed for the farmers of Missouri than is now offered them through our new "Farmers' Market Club" which those of our readers who have had time to study hail as the supplying of a long felt want. By belonging to this new "Market Club" each member has the right to list free of charge anything he wants to sell or buy in the Monthly Bulletin which is mailed to every member once per month. Thus, if you have some good seed corn, cowpea seed, soybeans, clover, timothy, oats or other farm seeds for sale, here is a good chance to sell them—or if you want to buy them you are certain to find a lot of them listed in the Monthly Bulletin and the names and addresses of the farmers who have them for sale. Likewise, if you want to sell some live stock, farm implements, or rent, sell or buy a farm or hire a farm hand—here is a big "farmers' clearing house" where you will be brought into direct touch with farmers who want to both buy and sell a lot of these things—a big "market place" where all kinds of farm seeds, feed, horses, mules, dairy cows, hogs, bulls, male hogs, stallions, harrows, plows, farm wagons, disc harrows, self-binders, farms and a hundred other things will pass from the man who has a surplus to the man who is in the market for them. Can you imagine a greater convenience? Haven't you long felt the need of just this kind of an organization?

Where as many as a dozen farmers belong to the "Market Club" in the same neighborhood we can supply the names of firms which will ship carload lots of oats, bran, hay, ship-stuff, coal and other similar commodities at wholesale prices and thus save the members a lot of money. If 50,000 farmers in Missouri will join the "Market Club" it is our intention to place a capable man in charge of a "Market Bureau" who will help our members find the best possible sale for their surplus apples, potatoes and other farm products which, under the present system, are often sacrificed for half their value.

For $1.50 we will mark up your subscription to The Missouri Farmer for two years and also give you two years membership in the "Farmers' Market Club"—and for those of our readers who act promptly on this suggestion we will also cancel all past due subscription. Look up the "Personal Appeal" on page 3 and see how you can get your own "Market Club" subscription free. As a clearing house for farm seeds alone, the few cents which membership in this Club will cost you for the next two years will repay itself many times over.

Ozark Farm Wanted

I want to buy a good 160 acre farm in the Ozarks. Must be close to a good school, church and near a good county seat town where there is a good market for produce. J. C. McAdoo, Bertrand, Mo.

Are there any co-operative enterprises in action in your community? If there is a creamery, elevator, fruit shipping or any other business that has been of benefit to your neighborhood it would help the movement along if you would write us to let others know how you manage it.

If every reader of The Missouri Farmer would send us a dollar on subscription it would enable us to pay our debts and give you the greatest farm paper you have ever seen. And think! At this rate the paper will only cost you 33⅓ cents a year. Isn't the fight we are making for the farmers of this state worth that much?

C. D. Lyon, R. 1 Georgetown, Ohio

ENDORSES CO-OPERATIVE GRAIN SELLING

Your timely article on organization renews my ambition on that subject. I have often in my public talks made this pointed and I believe correct remark: "That the agricultural schools are instructing us how to produce more grain with less labor, etc., but what we need is co-operative marketing, or some system that will bring producer and consumer nearer together, cutting out much waste profit to middle men, etc."

In regard to your article on co-operative marketing, I want to say I was helping in that fight and knew Tom Worrell and he has told it as it is. I helped organize the Farmers' Grain Company in Custer County, Nebraska, with C. Vincent of Omaha, manager and we did save to the farmers from $25 to $80 and more to each car shipped out, clear of all shipping expense, such as warehouse, transportation, commission and other expenses. That is to say, that much more than could have been received from the local elevator companies. There is no mistake but organization is the proper and only way to get relief. But it is necessary to have the proper "sticking" plaster to hold them together and I think you will get it. I would like very much if it is possible that you would come down within two or three days and take dinner with us and let us reason together. I know you can give me some good advice and pointers and I can tell you of some of of my experience with co-operative movements which is quite limited and yet is much greater than most of the people, especially those who have not taken active part in such organizations. Thos. J. Newbury, Hartsburg, Mo.

WE CAN IF WE WILL

The Missouri Farmer: Have just read your article "What Can We Do?" in your issue of December 1, and am very much interested in this farmers' organization movement, and long for the day when it may be established.

I can't see why we farmers and the consumers of the farmers' products shouldn't share the vast profits now enjoyed only by the packers and middle men.

Some will say "the farmers can't, and will not stick together" but when you hear that you can bet your bottom dollar he is the fellow that is not willing to line up to this proposition.

I for one am ready to join a school district farm club and do what I can in this fight. I am not in a position to undertake it as a leader but am willing to wade in with the remainder of the district and follow a leader.

I work in all kinds of weather. It hardly gets too bad for me to work, so my money comes hard, but the prospect is good for it to come harder if we farmers do not organize and protect ourselves. And I will be one of the 100,000 farmers to give $20 which will make a two million dollar fund to equip packing plants and storage houses for farmers' products, and will give more if they will line up and push this thing to a success.

We have just as much brains and ability among farmers as any business corporation has and I am sure we can do this one thing if we will only try.

Urging you to continue this fight I beg to remain, Robert L. Brown, Callaway County.

Have You a Farm Club?

If there are any Farm Clubs or farm organizations in your neighborhood, please send us the name of the President and Secretary at once so we can get in touch with them. We have prepared a splendid program of Farm Club Discussions which every farm organization in the state should take up. Please do this for The Missouri Farmer.

Get three of your neighbors to come in with you on the "Farmers' Market Club" and send us a check for $4.50—, and get your own "Market Club" subscription free. This is our "Special Club" proposition and every man who helps us out will have a place on our "Roll of Honor." Won't you be one of them?

Porterfield's Annual

Duroc Sale

To Be Held At

Jamesport, Mo., Tuesday, Feb. 8

50 Bred Sows and Gilts

My offering this year will consist of a very superior lot of useful Durocs, Selected from my Top Inventor herd because of size, bone and quality. *I breed the kind it pays to raise.*

10 TRIED SOWS AND YEARLINGS

Among the above are daughters of King of Cols. II, Beauty's Model Top, Top Inventor, and other well known boars.

40 SPRING GILTS

A very attractive lot of gilts sired by Top Inventor, Graceful Lad, Auctioneer II, etc. See the 5 gilts by Top Inventor out of a Col, Gano dam.

The offering sells bred to two of the best boars in Missouri,

TOP INVENTOR and IOWA CHERRY COL.

Top Inventor is easily one of the largest boars of the breed. Iowa Cherry Col. is the son of the noted Cherry Col,

Holstein Bulls for Sale

D. D. Moss & Son, Columbia, Mo., are advertising several high grade Holstein bull calves for sale. These calves are sired by a so nof Pontiac Gerber De Kol, and are out of high producing dams that carry the blood of the noted cow Missouri Chief Josephine. Messrs. Moss are pricing these calves at $25 each F. O. B. Columbia.

Rockwood Farm Durocs

Rockwood Farm, Iberia, Mo., is advertising some excellent bargains in Duroc spring boars and gilts. Only a few boars are left, but they are good ones and are priced extremely reasonable. This farm also offers a number of gilts bred for early spring farrow. No better blood exists than the blood represented in this stock, and individually it is right. Get their prices before buying elsewhere.

Baker & Son's Poland China Sow Sale

W. A. Baker & Son, Butler, Mo., write that their sale offering consisting of around 50 head of sows and gilts, is coming along in great shape and that they will be able to offer readers of this paper an extra good lot. Messrs. Baker have one of the pioner herds of big-type Polands in Missouri and for a number of years the herd has been a strong winner in the leading shows of the Corn Belt.

Official Bulletin No. 1

General Headquarters

"PREPAREDNESS CAMPAIGN"

Every American Farmer Should Enlist at Once

PAUL REVERE, over a century ago, dashed along the highway between Lexington and Boston, arousing the countryside with his warning of **"Prepare"** for the invaders are coming.

Within the last few months this very same cry, **"Prepare,"** has again re-echoed from one end of our own United States to the other, awakening we Americans as never before to our careless neglect in not preparing for our country's future welfare.

Right Now, we cry the same warning to the American Farmer, **"Prepare."** Purchase a silo now. Protect your live stock. **"Prepare"** for mid summers droughts and mid winters barrenness. The Everlasting Silo is the "Army" and "Navy" for farm protection. It has the strength of a dreadnaught and represents the same all-around efficiency as do "Uncle Sam's" soldiers.

We shall be glad to send full particulars including a handsomely illustrated booklet, telling of the many features of the Everlasting Silo by word and picture. Enlist our aid at once. It cost you nothing.

LEWIS McNUTT

Just now a few extra good spring boars are being priced very low in order to move them before the sale.

Porterfield's Annual Duroc Sow Sale—February 8

On February 8, J. A. Porterfield will hold his annual sale of Duroc sows and gilts at Jamesport, Mo. For several years past Mr. Porterfield has been holding these February sale and a great many of our readers have found it to be to their advantage to attend. The Porterfield herd ranks as one of the very best collections of Durocs in Northwest Missouri. The herd has always been maintained on a practical plan—the idea being to dispose of only the tops for breeding purposes and the balance are fed out for market. It will be recalled by many that the herd is headed by the great boar, Top Inventor. Top Inventor is admitted to be one of the largest Duroc boars of the breed. He was shown at the Missouri State Fair in 1914 and won third in one of the strong classes of the show. He has been given ample opportunity to demontrate his ability as a sire and he has come up to Mr. Porterfield's expectations.

Another boar that rendered valuable valuable service in the herd was Auctioneer II by Auctioneer, a son of Queen's Wonder Again. The third boar represented in the offering is a good son of the grand champion, Beauty's Model Top.

The offering this year will consist of about 40 head of early spring gilts, and ten head of tried sows and yearlings. Most of the spring gilts are by Top Inventor, though several litters are by Auctioneer II and Graceful Lad. These gilts are bred, for the most part, to the good young boar, Iowa Cherry Col. This boar was just added to the herd this year and is a son of the great boar Cherry Col. This Cherry Col—Top Inventor cross should get what the buyers are after and we predict that this cross will develop unusual size and bone. Among the spring gilts are several extremely toppy ones by Top Inventor and out of a Col. Gano dam. These gilts should prove very attractive. Among the tried sows is a 2-year-old daughter by King of Cols II a litter mate to King of Cols. This sow has proven a splendid producer and will be sold bred to Top Inventor.

Our representative saw the offering last week and is glad to recommend the sale to our readers.

Watch this paper for further details regarding this offering. Send for the catalog now and kindly mention this paper.

Smith Bros. Durocs

In a recent letter from Smith Bros., Thompson, Mo., they have the following to say: We are herewith sending change of copy for our ad. We are now offering the public the best lot of young sows we have ever raised. Several of these sows are by Col. Bob and Beauty's Model and are bred to Pal's Fancy Advancer. We have two young sows by S. & C's Valley Chief, grand champion boar at the 1915 State Fair. The dam of these sows is a daughter of the champion Beauty's Model Top. We are also offering two daughters of the champion Instructor and bred to Pal's Fancy Advancer. These sows and gilts are the real big type and not one of them has a mean "out" of any sort. They are bred to what we have reason to believe is the biggest yearling Duroc boar in the state. At 17 months this boar, Pal's Fancy Advancer, weighed 600 pounds, stood on a 9½-inch bone, measured 63 inches in heart, 64 inches in flank, and from tip of nose to tip of tail measured 8 feet."

Messrs. Smith are progressive breeders and are thoroughly reliable in every way. Our readers will like the kind of Durocs this firm sends out and will also like the prices.

First Call for Faulkner's Spotted Poland China Sale

Beginning with this issue H. L. Faulkner, the well-known breeder of Spotted Poland China hogs, calls attention to his annual bred sow sale to be held at Jamesport, Mo., February 9th. Mr. Faulkner is almost too well known to our readers to require any introduction at our hands. For years he has handled more spotted Polands than any other man. There are few, if any, herds in the entire Corn Belt but what contain more or less Faulkner breeding. Some of the greatest boars of the breed have been developed in this herd.

The approaching sale will consist of 50 bred sows and gilts—everyone of genuine old-fashion spotted breeding. A number of choice tried sows are cataloged, but the major portion of the offering is made up of yearling gilts, and spring gilts.

The offering as a whole is up to the usual Faulkner standard and we urge our readers who will be in the market this spring to keep this sale in mind. Send your name in now so that you will be sure to get a catalog. Kindly mention this paper when you write.

The Kind of Sows That Have Made the Faulkner Sales Popular

Angus Bulls and Heifers

D. L. Sutherland & Sons, Windsor, Mo., offer the readers of this paper some good values in young Angus bulls of serviceable age, and heifers either bred or open.

Messrs. Sutherland maintain a rather large herd and can therefore furnish most anything in breeding stock that one wants. This firm is thoroughly reliable and we take pleasure in recommending them to our readers.

Ennis Farm Jerseys and Spotted Polands

The Ennis Farm, Horine Station, Mo., advertises a nice lot of registered Jerseys for sale. This herd has been built up from a carefully selected foundation and is a working herd that yields a profit to the owner. When one buys dairy breeding stock it is worth while to know that the herd from which he buys is a profitable herd.

This farm also breeds spotted Poland Chinas and at present offers a nice lot of sows and gilts bred for early spring farrow. If interested in any of this stock you will be serving your own interest to get Mr. Ennis' prices before buying elsewhere.

Holsteins for Sale

M. E. Moore & Co., Cameron, Mo., write that they now have for sale a number of extra good Holstein bull calves for sale. These calves are from 3 to 10 months old and are out of some of the best producing cows in the herd. For over thirty years this herd has been considered one of the choicest collections of the breed. The prices are reasonable for the quality of stock offered. Mention this aaper.

McPherson's Duroc Bargains

Last week the writer spent a very pleasant day with J. E. McPherson, who advertises Durocs in this paper. Mr. McPherson informed us that he was completely sold out of boars and that for some time he had been compelled to turn down orders. However, he has a very attractive lot of bred gilts that are ready to ship and he is in a position to quote very reasonable prices. Everyone who has seen this herd have remarked on the exceptional size and bone shown. Mr. McPherson, is a stickler for these two

POLAND CHINAS

K. H. BROWN, - - BOLIVAR, MO.

ANGUS CATTLE

HERD FOUNDED 1904

Seven early calves—3 BULLS and 4 HEIFERS, sired by Dean's Eric 139686. Every one the right kind, and priced to sell.

V. E. LAWRENCE, SALISBURY, MO.

qualities and he has selected his breeding stock with the view of getting as much size and bone as is possible without neglecting the quality. Most of these spring gilts are of early spring farrow, and are largely the get of Golden Tat by Tatarrax Again, by old Tatarrax. They are bred to two good sons of Col. Wonder Again.

Mr. McPherson also offers a well bred Holstein bull calf, of good size and nice marking, at a price that should move him. When writing kindly refer to this paper.

Chester White Bred Sows

S. D. & B. H. Frost, Kingston, Mo., are offering splendid values in Chester White bred sows and gilts. Messrs. Frost have been identified with Chester Whites for years and the name of Frost is synonymous with quality, size and fair dealing.

Practically all of the sows and gilts for sale are bred close up to prize winning sires and dams. Our readers who are interested can scarcely do better than to get in touch with this firm, and ask their prices.

Hall & Rapp's Polands

Hall & Rapp, Rocheport, Mo., offer our readers spotted and black Poland Chinas. Several mighty good spring boars and gilts sired by the great boar, Smooth Columbus, are offered. The prices are $25 each F. O. B. Rocheport. Such breeding at the above price makes thees boars look mighty cheap.

Weller's Duroc Bred Gilts

J. E. Weller, Faucett, Mo., writes that the spring gilts and yearlings that he now offers the trade, are all bred for early spring farrow, and that they have size and bone and quality to a marked degree. Furthermore, the prices are such that some one is going to pick up some real bargains. Mr. Weller has shipped his Durocs into nearly half the counties of this state and he can show satisfied customers wherevr he hips. Get in touch with Mr. Weller, and kindly menytion this paper.

Belcher and Bennett Bros. Great Poland China Sale N

Our readers who are planning to buy Poland Chinas this spring will do well to keep in mind that on February 19th, John Belcher and Bennett Bros. will hold a sale of bred sows and gilts at the Bennett farm, a few miles west of Lee's Summit, Mo. It will be recalled by many of our readers that the top sale of Missouri last winter was made by John Belcher on his offering featuring the blood of Smooth Columbus. Smooth Columbus is easily one of the top boars of the breed, either individuality or as a breeder. The superior quality of his get made such an impression on Bennett Bros., who, by the way, were the heavy buyers at the above sale, that they entered into negotiations with Mr. Belcher for the purchase of this boar. Mr. Belcher would not entertain a proposition to sell Smooth Columbus outright, but he finally agreed to sell a half interest in the boar for $750. The deal was made and as a result the two firms will top their herds and offer the buying public a very superior lots of sows and gilts bred to this great boar.

The offering will be replete with attractions and we predict that the coming sale will be among the most attractive events to be scheduled in Missouri this winter.

It is not too early to write for a catalog. Write to either John Belcher, Raymore, Mo., or to Bennett Bros., Lee's Summit, Mo. Kindly mention this paper.

Need an Angus Bull?

J. D. Blackwell, Fayette, Mo., offers the readers of this paper some extra good young Angus bulls, at prices that are really bargains. Mr. Blackwell writes that these youngsters are all of nice ages, are strong, rugged fellows, showing extreme fleshing qualities, and represent several of the best families of the breed. Mr. Blackwell also informs us that he has a very desirable lot of heifers either open or bred—according to ages, that he is pricing worth the money. A bull and any number of heifers up to a carload can be purchased by our readers who are thinking of establishing an Angus herd.

JERSEY HEIFERS FOR SALE

Ten Jersey Heifers, 14 to 18 months old, sired by Imm's Signal No. 110996, out of extra fine Jersey cows that for three generations have been sired by registered bulls, bred to Kinloch Grouville Lad 91520 (grandon of the famouss Golden Fern's Lad P-2160 H. C. These heifers are due to freshen in February and March and are priced to sell at once. Write me, or better, come and see. Also eight three-year-olds of about the same breeding due to freshen in January and February.

D. V. VANDIVER, COLUMBIA, MO.

Brookview Herd of Hampshire Swine

One of the top herds of Hampshires of the entire country is the Brookview herd owned by Isom J. Martin, Lancaster, Mo., whose advertisement will be found elsewhere in this paper. Almost from its establishment this herd has been a powerful factor in the development of this growing breed. At the outset, Mr. Martin selected his herd material with rare judgment, and as a consequence he started from a point that had taken other breeders years to reach. As evidence of the merits of this herd it is only necessary to state that whenever Brookview Hampshires entered in competition with other

Duroc Gilts---Bred

A few extra good gilts, some a year old, sired by prize-winning boars and bred to Merry Chief, a prize-winner at Sedalia. Bred to farrow early next spring. Prices right.

ANNOUNCING A GREAT EVENT

TAYLOR'S 2nd DUROC SOW SALE

To Be Held at

Olean, Mo., Friday, Jan. 21

50 HEAD of COL. WONDER DUROCS

Col. Wonder—a grand champion and sire of champions. Every lot in the sale represents the blood of this great boar

I have selected for this event 50 head of bred sows and gilts, every one representing the blood of Col. Wonder, grand champion Missouri State Fair, 1913, and sire of the grand champion sow at the same fair in 1914 and again in 1915. No better blood exists than Col. Wonder breeding. Included in the sale are daughters and grand daughters of Col. Wonder, and sows bred to him.

SPECIAL ATTRACTIONS

As special attractions I am putting in my entire show herd of sows except the grand champion. There is a litter mate to the champion sow, and also a litter mate to Col. Wonder cataloged.

Remember the date and watch this paper for further announcement.

THE SALE YOU HAVE WAITED FOR

UNSELL'S GREAT DUROC SALE

Louisiana, Mo., Wednesday, January 19

40 RICHLY BRED SOWS and GILTS

I take great pleasure in inviting the readers of this paper to be my guests on the above date. I have selected the offering with great care and believe it to be one of the most attractive lots to be sold this year. Included in the sale are some of my best producing sows. Such as the great sow, WILDA DUCHESS FOREST, by FOREST CHIEF, COL'S TATTLETALE, by .CHIEF'S COL, I WONDER, a daughter of DISTURBER and LUCY WONDER 166, MISS FASHION by FASHION, and others of equal breeding make up the offering. Most of the lot sell bred to one or the other of my two great herd boars,

UNSELL'S DEFENDER 65225

a son of the mighty DEFENDER out of MODEL PRINCESS 1st, or

COL. ILLUSTRATOR 63701

by the champion ILLUSTRATOR out of BONNY TIPPY.

A sow bred to either of the above boars will put your herd in the limelight.

Sale will be in a heated pavilion.

Send now for catalog.

R. P. Royce will represent this paper. Bids intrusted to him will be handled honorably.

Col. Iglehart, Auctioneer

J. B. UNSELL - - - Louisiana, Mo.

C. L. Taylor sells Durocs at Olean, Mo., January 21st

herds they usually got their share of the prize money. At present the herd is headed by two grand champion boars, the name of either being familiar to all Hampshire men, Gen. Tipton and Sir Brookview. The get of these two boars will be found in most of the good herds of the breed. Mr. Martin can furnish our readers with most any age breeding stock they want. Spring boars and gilts as well as bred sows are being priced for sale, and the prices asked are in keeping with the quality offered. Bear in mind that in starting a herd or when adding new blood to established herds it is highly important that only the blood of the best be used. Mr. Martin has as good blood as the breed affords. In writing mention this paper.

Taylor's Sale of Col. Wonder Durocs

One of the most important events of the coming sale season is the annual offering of Durocs from Cha. L. Taylor's celebrated Spring Dale herd. This sale will be held Friday, January 21, at Olean, Mo. Mr. Taylor has selected for this event an unusually attractive lot of Duroc sows and gilts, everyone representing the blood of the noted boar, Col. Wonder, grand champion at Sedalia in 1913 and sire of the grand champion sow in 1914 and again in 1915.

The offering will include three mature sows, twelve spring gilts and the balance will be yearlings.

Among the tried sows is Miss Crimson Wonder, a litter mate to Col. Wonder. It is rare that such a splendid producing sow is cataloged for sale, but Mr. Taylor has determined to make up an offering that will attract any breeder or farmer who is looking for Durocs of merit. Miss Crimson Wonder was shown at the state fair in 1912 and 1913 and each year she was second in her class and the sow that defeated her was made grand champion. A very attractive March yearling daughter of Col. Wonder and out of a Col. Prim dam will please the critical buyer. This young sow has plenty of size and should develop into a very valuable sow. She was 4th in class at Sedalia in 1915 and 3rd in class at St. Louis. She was also in the first prize aged herd at both shows.

Belle of Olean, a March yearling by Professor's Col., and out of Belle of Missouri 4th, a litter mate to Belle of Missouri 3rd, grand champion sow of 1914, is the largest sow in the sale. She shows extreme width and depth and quality. Belle of Missouri 3rd is perhaps the largest Duroc sow in Missouri.

Col. Wonder's Dream II, a litter mate to Col. Wonder's Dream, the sensational grand champion sow this year, will be one of the real attractions of the year. Unfortnately, this great sow has a short tail, but aside from that she looks as though she could make it interesting for her illustrious sister. She sells bred to C. L.'s Col. Wonder. No. 7 in the catalog, a September yearling by Col. Wonder and out of a dam by Illustrator, was good enough to win first in class at St. Louis and second at Sedalia. She was also a member of the first prize young herd at both shows. She sells bred to Show Me, junior champion at Sedalia this past year.

One of the best prospects for a big sow is the September yearling, Missouri Queen, by Professor's Col., out of a daughter of the great sow, Queen Ester. This sow was first in class at Sedalia. One of the tops of the offering is the March yearling, No. 12 in the catalog, that is a full sister to Show Me, the junior champion boar.

The above will give our readers a hint as to the quality of the offering. Suffice it to say that this sale will not disappoint in any way, and we are glad to recommend it to our readers as a place to secure Durocs of proven merit.

Send for the catalog and arrange to be present on the 21st. In case you are prevented from attending in person any bids you may care to send will be handled with fairness by R. P. Royce, who will represent this paper.

Dr. Unsell's Duroc Sale

We wish to direct the attention of our readers to the announcement of Dr J. B. Unsell's Duroc sale to be held at his farm adjoining Louisiana, Mo., on Wednesday, January 19th.

For several years past Dr. Unsell has been engaged in assembling a herd of Durocs that would rank with the best. He proceeded on the theory that foundation animals should be selected because of their peculiar individual excellence as evidenced by their breeding, individuality, and production. Whenever the Doctor found a sow that came up to this standard she was purchased providing the price was not out of reason. But a cheap price nor a high price never got a sow or boar a place in this herd, individual excellence alone counted.

Naturally, the development of this herd has been watched very keenly by Duroc men and much speculation has been indulged in as to when the owner would give the public a chance to buy the produce of the herd. Dr. Unsell is now ready for the public to judge the value of his Durocs and the approaching sale will afford the opportunity.

The coming sale will consist of about 40 or 45 head of bred ows and gilts, representing the very cream of Duroc blood lines. Space does not permit detailed mention of all the good things to be offered but from the following our readers can gain on idea as to the offering.

There are five or six daughters of G. C's Col. that are mighty attractive sows. These sows are two-year-olds and have all proven to be especially good producers. Col's Tattletale by Chief's Col. and out of Tattletale of Idlewild is a very attractive sow. Wilda Duchess Forest by the noted McKee boar, Forest Chief out of Wilda Duchess will furnish competition for the buyers. She sells bred to Unsell's Defender. I Wonder by Disturber out of old Lucy Wonder 166 is a splendid young sow. Miss Fashion, by Fashion, one of the noted sons of Defender, goes in as a very special attraction. Practically all of the sale offering sells bred to one or the other of the two herd boars, Unsell's Defender 65225, and Col. Illustrator 63701. Unsell's Defender, as suggested by the name, is a son of old Defender, the best known boar the breed has produced. The dam of this boar is Model Princess 1st by Model Cherry. Unsell's Defender gives every promise of developing into one of the big boars of the breed. He is a powerfully put up youngster, showing unusual size and mamoth bone. Col. Illustrator is by the champion Illustrator and has for a dam the great sow Bonny Tippy by Tippy Col. Dr. Unsell is planning great things for this boar and if everything goes well breeders will be after his blood.

We have seen this offering and trust that our readers will give it the support it deserves. Dr. Unsell does not expect fancy prices because this is his first sale and for that reason there are bound to be some bargains.

Send for catalog and arrange to be there in person or represented with bid The sale will be held in a heated pavilion Mention this paper when you write.

White to Sell Durocs in February

Just before going to press we were informed that A. White, Jr., Palmyra, Mo., plans to hold a bred sow sale some time near the latter part of February. We feel sure that our readers will be interested to learn of this sale and we believe that we can assure them of a superior offering.

Mr. White has been getting ready for this sale for a long time and the offering that he has selected will represent his best efforts as a breeder. The great boar Select Col. II ,now at the head of the White herd, will figure very strongly in the sale. Select Col. II is regarded by many as one of the top boars of the breed. Watch this paper for further announcement in subsequent issues.

Baldwin Offers Poland China Gilts—Bred

R. F. Baldwin, Rocheport, Mo., is now advertising a very desirable lot of spring gilts that are bred for early spring farrow. These gilts are all of strictly big type breeding and are sired, for the most part, by Mr. Baldwin's splendid boar, King Jumbo, by King of All, the noted Iowa boar. Mr. Baldwin has handled these gilts in a way that assures their future usefulness to the buyer and the prices asked are reasonable indeed.

Angus Bargains

In a recent letter from J. M. Jones, Everton, Mo., he says that the Angus bulls and heifers he now offers are exceptionally good in every way, and that he is pricing them to sell as he needs the room. Mr. Jones is a practical breeder and is thoroughly reliable in every way. In writing please mention this paper.

Spotted Poland China Bred Gilts

B. B. Megown, New London, Mo., can fill the orders of any of our readers who are in the market for choice spotted Poland China sows bred for early spring farrow. Get his prices on this bred stuff.

BETTER FARMING BETTER FARM HOMES BETTER CITIZENSHIP

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

Where Do You Stand?

The California Fruit Growers' Association is now contemplating going over the heads of the fruit jobbers and distributors and selling its product direct to the consumer. In other words, this great and successful organization which has saved millions of dollars to the orange growers of the West during recent years is about to take the step which The Missouri Farmer is advocating with reference to the Packing House Combine. And why not? Why should it not shake itself loose from these parasites who perform no absolutely essential service? And who will say it nay? Organized, successful and in control of the orange industry of the Country, is not its power in the premises absolute? If it makes up its mind to sell its own product direct to the people, what is the fruit jobber going to do about it? Won't what he thinks about it matter just about as little as the number of spots on the sun? And would not the power of the live stock producers of the Country be equally absolute if they were similarly organized? If they owned their own Packing plants and distributing markets, wouldn't they be able to tell the Packers to go hang?

Several weeks ago, I chanced to run into a friend who had 4,000 bushels of splendid Jonathan apples in cold storage. He is an expert horticulturist, sprays his trees carefully and I doubt whether one could find a finer lot of Jonathans in the Country at this time. "I am on my way to Chicago now to sell my apples," he said, and when I asked him what he expected to get for them he replied: "I'll have to sell them to a jobber and I hope to get at least $1.25 per bushel." "What will the consumer have to pay per bushel" I asked and he answered "About $2.50." Taking these figures for granted, it means that my friend will receive $5,000 gross for his apples. This will be his total reward for a year's patient toil, battling against insects and weather, interest on his investment, pay for picking, barrels, cold storage rental, freight, etc.—while the jobber and distributors will also get $5,000 for merely taking them out of the cars after they arrive in Chicago and giving the public a chance to buy them. Here you have an example of how the thing is done—how simple the process by which both producer and consumer are "made the goats" of this marvelous system of distribution. It is to free itself for all time to come from such brigandage as this that the California Fruit Growers Association is about to "burn the bridges behind it"—and thus the policies of The Missouri Farmer are about to find endorsement at the hands of the most powerful producers' organization in the Country.

In the meantime, what are you doing to help out in your community? The fight can't be won by sitting around the kitchen stove. It doesn't do any good for you to mutter "good work" as you finish reading an issue of the paper—and then go to sleep until the next one arrives. There are two great things which need to be done at once in every school district in Missouri. First, The Missouri Farmer needs to be introduced into the home of every one of your neighbors in order that they may be enlisted in this great new movement—for until they become aroused to the impending danger we will not be able to get anywhere. To this end, go to them at once and ask them to subscribe. Tell them I will return their money if they are not satisfied. Then prepare to organize a Farm Club. At first, call a meeting of a few leading spirits at some neighbor's home. Then follow it up by calling a school house meeting—and then send to us for Constitution, By-Laws, instructions, etc. Hundreds of our friends are already doing this—but why shouldn't every reader of the paper get into the fight? In the meantime, don't forget about your own subscription. If you will send us a dollar promptly, all past due subscription will be cancelled—but this offer will shortly be withdrawn. But why not also send along the subscriptions of several good neighbors? Why not make this fight a living, vital force in your community? Why not organize while farmers are not rushed with work? Where do **you** stand?

Answers Almost Any Question That Arises on the Farm

Here is a book you can carry easily in in your coat pocket that will tell you instantly and to a penny just how much money is coming to you when you sell your hay, grain or stock at the market price. It is Ropp's New Lightning Calculator—a wonderful time and labor saver for the busy man. It never makes a mistake—and answers a thousand perplexing questions that arise on every farm.

FREE to LANDOWNERS ONLY

Hundreds of thousands of copies of this wonderful book have been sold and the regular price of this edition is 50 cents. However, to acquaint the readers of this paper with the unusual merits of **Square Deal Fence** we will gladly send a copy of Ropp's New Calculator just as illustrated FREE and POSTPAID. We will also mail our latest catalog of

Square Deal Fence

the favorite field and stock fence of discriminating farmers everywhere. The Square Deal Lock double grips the one-piece stay wires to the wavy strand wires without cutting, breaking or slipping. Combines solid strength with remarkable flexibility. The self-draining shape of the Square Deal Lock prevents rust. The one-piece stay wires prevent sagging, bagging and buckling, require fewer posts—the wavy strand wires give springiness, elasticity and life. Landowners! write at once for catalog and get your copy of Ropp's New Calculator free, postpaid. Address

A FARMER'S WAY FOR PREVENTING HOG CHOLERA

To The Missouri Farmer:

I have a card from the United States Department of Agriculture requesting me to help in preventing hog cholera. I know of no other way than to help others to learn how to care for their hogs. The first thing to do is to be interested in the welfare of the hog, that is to make him as comfortable as possible in the way of a good dry and warm place to sleep, and then use good common sense. When you feed them don't just pile a wagon load of corn in the lot and wait for them to clean it up and think you are doing all that is necessary. That is all wrong. Hogs are the most difficult animal we have to feed as they are the more liable to fatal attacks of indigestion than cattle or horses. The stomach and bowels become inflamed from over eating too much grain will drop out and fail to come to his feed but not be very sick but since, as long as there is corn scattered around he will some time during the day go and eat a little of it. That hard dry fever making corn will irritate his stomach then he will crawl off in some corner and lie there till he feels just a little better then he will come poking up to the corn again and take another nibble and that is about the last time he will come.

The next thing we hear is that neighbor Jones' hogs have the cholera. They have all been treated alike, some are weaker than others and they get sick first but the whole herd is not doing well. Pretty soon there will be some more falling out of the ranks, then neighbor Jones thinks he must do something. He may be like some others, think he had better ship them or have them vaccinated, but neither one will cure the hog of his trouble.

I will give you my receipt for preventing hog cholera: I feed just what they will clean up and leave them hungry enough—to want a little more. Always feed slop once a day, made from shorts and oats, equal parts, just enough concentrated lye to cause the mixture to turn slimy and slightly yellow and add enough salt to taste and use some tankage. If you have one that gets sick take it out of the feeding lot and put it where it can't get one grain of corn and give it all the water it wants. Dish water with a little milk is better than plain water. It may go for days without craving a drink. Do not offer it anything to eat until it gets to moving around then give a little ship in its drink; care for it that way for a week. When it seems fairly well give small amount of corn once a day, one small ear is a plenty; keep up the slop and the hog will be all right. J. P. Laney, Windsor, Mo.

Editor's Comment: There is no doubt but what a great many hogs are lost every year from worms and from indigestion caused by over feeding on corn. Mr. Laney's suggestions about careful attention and feeding are good and the best feeders and hog raisers are those who give this kind of close attention to their herds. But after we have done all we can do in the way of feeding and in keeping our premises clean and healthful, if the hogs by some chance come in contact with the germs of cholera they will most certainly get the disease. Just as surely as the most robust child in the family will contract measles, whooping cough or smallpox. The wise thing to do is to follow the advice of the successful feeders as to balancing rations, careful feeding, clean premises, isolating sick hogs, etc., but if after all this our hogs are exposed better not lose a moment's time in having them vaccinated with anti-hog-cholera serum.

SUCCESSFUL CO-OPERATION

The Missouri Farmer:

I am a farmer and own 160 acres of land and am a stockholder in a co-operative grain company with a capital stock of $10,000. We are talking of increasing our capital stock to $16,000. We are young in this business but have made a fine success so far. We buy all our flour and corn sell in fact everything the farmers need in the way of feed stuff. Some of us read the article of December 1, on "What Can We Do?" on this meat proposition. I heartily endorse your stand on that question and as I am secretary of our farmers' school district they asked me to write you for plans and instructions on how to get at this proposition for we all are willing to try. What we have undertaken in a small way on co-operation here has sure paid well for corn is bringing a better price in our town than most other towns nearby. Before we organized it was lower in our town than any other near us. We are sure making them come across so we want to make them come across on the live stock and we can.

C. E. Walkup. Windsor.

Do you want to rent, sell or buy a farm? If so, you should join our "Farmers' Market Club" without delay. contain a lot of mighty valuable information. When you write, always please mention The Missouri Farmer.

I'll Rid Your Hogs of WORMS

GILBERT HESS, M. D., D. V. S.

Your hogs are almost certain to be troubled with worms right now; in fact, at all seasons of the year. Unless you treat for worms and get rid of them you can't fatten your swine at a profit.

How about the spring pigs? The chances are that your brood sows are worm-infested. This means stunted litters—pigs from a wormy sow can't get the right start.

I guarantee that if you feed my Stock Tonic regularly as directed, you will rid your hogs of worms, they will keep toned up and vigorous, resist disease better and fatten quickly and cheaply.

Dr. Hess Stock Tonic

25-lb. pail, $1.60. 100 lbs., $5.00.

A Fine Conditioner—A Sure Worm Expeller

Your horses, cattle and sheep are apt to be out of fix right now, because animals off pasture and on dry feed are deprived of the laxatives so plentifully furnished in grass.

Feed my Stock Tonic to your animals now. It contains tonics for enriching the blood, tonics to help their digestion and help them assimilate their feed better, as well as laxatives for keeping the bowels regular and clean.

Remember, when you buy my Stock Tonic from your local dealer you save peddler's horse, team and traveling expenses, and the small dose quantity will prove that my Stock Tonic is the most economical, too. Now read this guarantee:

So sure am I that Dr. Hess Stock Tonic will positively rid your hogs of worms and keep your stock healthy and vigorous, that I have authorized my nearest dealer to supply you with enough for your stock, and if it does not do what I claim, return the empty packages and get your money back.

25-lb. pail, $1.60; 100-lb. sack, $5.00; smaller packages as low as 50c (except in Canada and the far West and the South). Why pay the peddler twice my price?

Dr. Hess Poultry Pan-a-ce-a

I guarantee that this fine poultry tonic will help your hens lay. It will keep them toned up, arouse the dormant egg organs and keep your poultry healthy. Easy to feed and very economical—1 cent's worth a day is enough for thirty fowl. Never sold by peddlers. 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail, $2.50. (Except in Canada and the far West.)

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks or, if kept in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes, etc. Comes in handy sifting-top cans. 1 lb. 25c; 3 lbs. 60c. (Except in Canada and the far West.) I guarantee it.

Send for my book that tells all about Dr. Hess Stock Tonic—it's free.

DR. HESS & CLARK, Ashland, Ohio

Bumper Grain Crops
Good Markets — High Prices

Prizes Awarded to Western Canada for Wheat, Oats, Barley, Alfalfa and Grasses

The winnings of Western Canada at the Soil Products Exposition at Denver were easily made. The list comprised Wheat, Oats, Barley and Grasses, the most important being the prizes for Wheat and Oats and sweep stake on Alfalfa.

No less important than the splendid quality of Western Canada's wheat and other grains, is the excellence of the cattle fed and fattened on the grasses of that country. A recent shipment of cattle to Chicago topped the market in that city for quality and price.

Western Canada produced in 1915 one-third as much wheat as all of the United States, or over 300,000,000 bushels.

Canada in proportion to population has a greater exportable surplus of wheat this year than any country in the world, and at present prices you can figure out the revenue for the producer.

In Western Canada you will find good markets, splendid schools, exceptional social conditions, perfect climate, and other great attractions. **There is no war tax on land and no conscription.**

Send for illustrated pamphlet and ask for reduced railway rates, information as to best locations, etc. Address

Missouri Farmers Take First Step For Better Marketing

By Geo. B. Ellis, Managing Editor

irteen states have formed state keting bureaus within the last and the time has come when the ers of Missouri should get busy join with the farmers of sister s to get some relief from the ent intolerable conditions in dis- g of our farm products. The preliminary step has been taken organizing a state farmers' mar- g bureau and no backward step ld be made but every farmer in state, big or little, landlord or nt, hired man or salaried mana- who produces anything to sell, ld join this movement and help it to success.

the suggestion of The Missouri ner, the secretary of the state d of agriculture, Honorable ll Mayes, issued a call for a state ention on marketing and market itions to meet in Columbia, Wed- ay, January 5, 1916, during Far- Week. In response to this call t one hundred representative far- met on the above date in the e County courthouse and listened a address by the Honorable David n, a world-wide authority on or- ation and marketing for farmers. Lubin showed how by the most ct organization known to civili- n the German farmers absolutely rolled the marketing of their pro- s to such an extent that an in- ous trust for the fixing of prices as we have in this country, is ssible in Germany. Furthermore, through this perfect organiza- starting with the small township leading up through the county, tate and the nation no legislation pass the German Congress affect- agriculture without the endorse- of this farmers' council. "On one hand," said Mr. Lubin, "we that the economic system of the rican farmer is injuriously af- d through defective marketing of products. On the other hand we that there is perhaps no time in history of this country when the rican farmer was better off, when ad more money in the bank, etc. or the country as a whole, why at our cities with their miles and s of skyscrapers and palaces, the der of the world; and when we ld all these things there should to be no hurry to catch up some gn system with an unpronounce- name and try to force it on the rican people.

here is a strange similarity be- n these arguments of today and e used in old Rome in the time of rius Gracchus, in the days of the an Republic, when Tiberius cried e is dying.' 'Restore the land ing farmer or the Republic will sh.' And what was the response? Romans showed him miles and s of streets with marble palaces. Pointing to these they said, 'See, beforetime these buildings were of adobe, of clay, of brick, now they are marble palaces; how is Rome dying?' He predicted that the vast number of foreclosures of the land owning farmers of Rome would soon convert the free conservatives of the Republic into destructive radicals. And what he predicted came to pass!

"After Rome had conquered Carthage, Egypt and Syria the conquering lords brought the cheap corn of those countries into Italy. This forced the Roman farmer into debt, to borrow money of these lords. As a result of all this the Roman farmer was eventually driven from his land. And what happened then? This, Rome perished and crumbled to dust and ruin and we of the twentieth century go to Rome to see these ruins.

"And so it will be in the case of the American Republic if we stolidly permit the operation of a system which must cause the conservative, the landowning farmer of the Nation, to be displaced by the renter."

"While there should not at this time have been more than a trifling percentage of American farming lands in the hands of renters, what do we find? We find that 37 per cent of the agricultural land in the United States is now in the hands of renters; 16 per cent of these renters sprung up during the last 10 years of the census. The census was taken up to 1910 and this is now 1916, and with the same ratio of increase it is now nearly up to 50 per cent. And what of the future? Will it rise to 60, to 70, and so on? If so the American Republic is surely groping its way toward the downward incline of old Rome. They have done away with that sort of thing in Germany and why should we not do away with it here in the United States? We can do away with it by adopting a like system of farm organization and marketing."

We merely make use of the above excerpts from Mr. Lubin's address to emphasize what we have so often said to the farmers of Missouri, that present conditions unmistakably show that we are facing a crisis that only united and early action can avert.

After some further discussion the conference adjourned over to the following day when some 500 or 600 farmers and farmers' wives met in the agricultural auditorium and completed the temporary organization of a state farm marketing association. E. H. Bullock, of Edina, Knox County, was made chairman of the temporary organization and J. Kelley Wright of the state board of agriculture, was made secretary, both to serve until a permanent organization is effected. By unanimous vote of those present the chairman was authorized to name a committee of fifteen who acting with the chairman should issue a call and fix the time and place for perfecting a permanent organization. After adopting the declaration as set forth on this page, the meeting adjourned subject to call as above set forth.

It now rests with the farmers themselves whether or not this new organization shall grow into a powerful business association able to eliminate the great loss now suffered in marketing our products and to put a stop to the discrimination and unfair competition practiced by the greedy trusts which now have control of our markets. When this call is made it should be immediately responded to by every sound thinking farmer in the state, rich or poor, big or little, landlord or tenant. It is going to take co-operation, it will take organization, it will take the united efforts of the thousands of farmers of Missouri and the millions of farmers of the United States to win this fight and win it we must or perish in the effort. It will not only take the co-operative effort of a majority of the farmers to win this great fight but it will take means, thousands of dollars to pay the legitimate expenses of such an organization. But if farmers will stop to think that they are now paying tribute to the trusts every time they sell a hog, a sheep or a steer; that the housewife pays tribute every time she sells a dozen eggs or a pound of poultry or butter; the cost of maintenance of such a farm marketing organization as is herewith proposed will be a mere pittance when compared with

AN ADDRESS TO THE FARMERS OF MISSOURI

We, the farmers of Missouri assembled at "Farmers' Week" hereby declare to our fellow farmers throughout the length and breadth of the state that the gravest crisis in the history of the American farm confronts us at this hour—that the great Meat Packers' Combine, the dealing in grain futures and other like bardens are resting like a black pall over every farm home in the land and fast robbing farm life of all its pleasure and profit. It is because of these sinister influences that farm mortgages and land tenancy are constantly increasing—that rural population is steadily growing less and that thousands of the brightest country boys and girls are being driven to the already overcrowded cities.

Notwithstanding that the increase in meat exports to the warring countries of Europe in 1915 over 1914 amounted to a half million beef cattle and approximately two million hogs, the farmers of this and other states have for some months been passing through one of the worst live stock markets they have ever known—and the hour has arrived when we must either put an end to this practice or submit to a condition little better than Agricultural bondage for all time to come.

Truly as farmers we find ourselves in the midst of a remarkable situation. The international trade balances in our favor during 1915 have broken all former records and it is predicted that New York rather than London will become the future financial center of the world—and yet the true credit for this great achievement belongs to the American farmer rather than to the manufacturers of powder, guns and shells, for it was the farmers' surplus wheat, beef, pork, cotton, corn, horses and mules that have been responsible for the lion's share of the tremendous trade balances which promise to make us the financial Mistress of the Universe. Unlike the manufacturer of war supplies, however, the farmer has not been in position to demand what his products were worth. On the contrary, while he has provided a trade balance large enough to protect American finances and industry against the steady liquidation of our foreign owned securities and brought new glory and prowess to his country, he is being fleeced as never before in his history—and unorganized as we are and have been for years we are helpless.

Again, we repeat that the hour has finally struck when we must give battle to the industrial vampires who are robbing the farm of all its joy, profit and enthusiasm or when we must resign ourselves to a condition of Agricultural servitude—and that our self respect and our duty to our children precludes the latter course goes without saying. To this end, we urge the immediate organizaton of a Farm Club in as nearly as possible every school district in the state. We further urge that a county mass meeting of farmers be called in as many counties as possible and that a County Farmers' Association be formed—these later on to be amalgamated into a powerful state-wide organization of farmers and that by these means we may soon provide ourselves with the facilities and the strength necessary to dealing with the grave situation which confronts us and upon the successful solution of which depends the future of every farm home in the land.

what is being filched from our honest profits from year to year.

In our next issue we hope to be able to publish the names of the committee of fifteen farmers who with president Bullock will fix the time and place for this permanent organization. And when that call is made we sincerely trust that every one of the fifty thousand farmers who reads The Missouri Farmer will put his shoulder to the wheel and help push the Missouri Farm Marketing Association to a complete success.

FUTURE PRICES FOR HORSES

I have never been able to figure out anything else except the Spanish-American and British-Boer wars that made the prices of horses go higher, quicker than was ever known before, following their low time of 1897 when according to statistics they were only worth $31.61 per head.

Now there is one thing that I want you to bear in mind, that we had at the outbreak of this war 21,496,000 horses in the United States. I think that no truer words were ever spoken than those that fell from the lips of old Patrick Henry when he said, "We have no way of judging the future except by the past." So I am going to take you back as far as 1880 and bring you up to the present time covering three and one-half decades.

In 1880 we had in the United States 11,201,800 horses; we had a population of 50,155,178, only about four and one-half times as many people as horses. In 1890 we had 14,215,837 horses and a population of 62,947,714, again not quite four and one-half times as many people as horses. In 1900 we had 16,-206,802 horses and a population of 75,994,575, again a little more than four and one-half times as many people as horses. In 1910 we had 18,-718,578 horses and a population of 91,972,266, nearly five times as many people as horses. Now you see that the increase of our population from 1880 to 1890 was from 50 millions to 62 millions, approximately twelve millions and from 1890 to 1900 was from 62 to 75 millions, an increase of 13 millions and from 1900 to 1910 was from 75 to 91 millions, an increase of 16 millions, and estimating our increases at the same ratio at the outbreak of the war we had a population of more than 100 millions and our statistical report showed 21,496,000 horses, so you see again we had five times as many people as horses in the United States.

Now that we have seen that our increase in population and horses go hand in hand at about the same ratio, let us see about the increase of the number of farms and our commerce. Our commerce is more than two and one-half times as great as it was in 1880. We had at that time a little less than three million farms, while today we have more than six and one-fourth million farms. Our farms have increased in number more than one million in the last ten years so in 1880 we had 11,201,800 horses and less than three million farms which would be about four horses for every farm and at the outbreak of the present war with 21,496,000 horses and more than 6¼ million farms, you see there is only a little more than three horses for every farm and in these figures you must remember that every horse from the youngest to the oldest is counted.

There were in 1880 when we had 11,201,800 horses, about 57 million acres of corn planted and in 1915 with 21,496,000 horses more than 108 million acres planted, more than 59 million acres of wheat and more than 40 million acres of oats. As the country becomes more densely populated and the acreage of everything becomes greater, it requires more and more horses.

Now that we have dealt with our domestic affairs, I want to talk to you some about our export trade and the Spanish-American and British-Boer Wars. On February 15, 1898, the battleship Maine was blown up and 266 American lives lost. On April 22d, President McKinley declared all Cuban ports closed and on April 24th Spain declared ware on the United States. Immediately following this our government commenced buying horses for the war. Following the close of the Spanish-American war, came the British-Boer War which broke out October 11, 1899, and England began buying horses at once. Now we find that the greatest number of horses exported in any one year up to 1899 was 5,246, and that in 1899 we exported 13,894, and in 1900 we exported 64,722 head, in 1901 82,250, and in 1902 103,020 head. You see that during those three years we exported 249,992 horses and 105,350 mules or a total of only 353,352 head during the whole of that war. Now let us stop and think for a minute that we have already in this war exported more than twice that number and no signs of peace, with everyone predicting that it will last from three to five years.

Our horses were valued at $31.61 in 1897 just before the breaking out of the Spanish-American war and at $44 per head in 1900, and mind you the war going on then was the very thing that every right thinking man will tell you made them go higher from that time on and in 1905 our statistics show they were valued at $89.91 per head. They had more than doubled their price of the first year of the British-Boer War and nearly trebled the price of one year prior to the first or Spanish-American War. Now I want to compare the price of the first contract price of the British-Boer War of $94 per head to the first contract price of the present war at $210 per head. I think the contract price at the close of the British-Boer War was $156. Now do you not know that the horses are distributed differently to what they were at that time? Don't you remember at about that time they were so cheap that you could go onto the range and have all you would round up at a dollar per head? Don't you remember reading in the papers that where they were unable to sell them, they were shooting them to get the range for cattle and sheep and some of the members of the Humane Society were wanting to have them arrested for taking the lives of the poor innocent horses? I want to ask you if that condition of things existed at the outbreak of this war? I want to say, No! Why, not four weeks before the present conflict began there were grade range mares sold at auction at Miles City, for more than $160 per head, unbroken, for breeding purposes and not only one or two but hundreds of them were recorded in the account of the sale at more than $160. Our export trade didn't stop with the war; that depleted territory had to be replenished and in 1903 we exported 34,-007 head and in 1904 we exported 42,001 head and in 1905 we exported 35,820 head and the ten years following we exported more than twice as many as we did during the war and just so it will be when this one is over; the whole of Europe will have to be replenished and if it took ten years to supply Great Britain, how long do you think it will take to supply her again along with all the rest of Europe? I want to tell you I don't think it will be done under twenty years. They will not only have to look to us for their work stock but they must come to us for their seed, their breeding stock. I want to go on record that we will have no more importing societies or firms but that we will have exporting firms and breeders.

Now just a word in the analysis of the European horse interest. Russia leads with 32,146,235 at the outbreak of the war. She also has a population of 170,000,000. Germany had 5½ million and more than 800,000 of them were in the army. France had a little over 3⅓ million. The United Kingdom, including England, Ireland, Scotland and Wales had 2,116,800 head. Austria-Hungary with 1,177,077 and Italy with 1,020,000, all of the countries had less than fifty millions of horses and an approximate total population of 461,259,916.

I have here a table compiled by some of our statisticians clipped from the Daily Drovers' Telegram. This table gives the prices and approximate range of values that have prevailed in the Kansas City market in the years named:

	Drafters	Drivers	Southerners	Mules
1900	$70-170	$50 up	$20-80	$30-150
1901	85-165	40 up	20-90	35-165
1902	80-225	75 up	20-85	40-210
1903	135-250	75 up	25-100	40-200
1904	135-270	65 up	35-110	40-205
1905	130-275	75 up	20-100	40-210
1906	130-245	70 up	20-110	55-225
1907	145-275	60 up	25-105	50-200
1908	150-285	80 up	40-140	50-225
1909	135-275	80 up	40-150	70-250
1910	125-300	80 up	40-165	80-275
1911	125-275	80 up	40-150	80-265
1912	120-275	80 up	40-165	80-265
1913	120-290	80 up	40-165	75-265
1914	120-290	80 up	40-175	75-265
1915	120-275	80 up	40-175	75-265

If you will now think back to what I have said relative to war dates and compare the years before the war and the prices thereof for horse flesh and then compare the years following the war and the comparative prices for horses and mules, you will get in mind exactly what I am trying to bring home to you, the fact that better things are in store for the horse breeders who handle good ones after this big war is over. I am optimistic over the future outlook for the horse industry.

I have given you all the facts and figures as they now are, and I cannot see for the life of me why horses and mules will not be higher than we have ever seen them. There are today less full aged horses from five to twelve years old in the country than I have ever seen. You must remember those that have been shipped to warring countries have gone fron forever, and have not supplied an the trade in the east or south. must also remember that this wa the most gigantic conflict that his records. Almost the whole kn world is at war today. Think o Is it any wonder that business wa a standstill in our country for awl Everyone stopped and stood agha the stupdendousness of it all, each wanting to see just where he was, as time has gone along our good p ident having guided our ship pas the dangers of war, not only Mexico, but with Europe, busines resuming the greatest activ known to our government

Now Mr. Breeder it is up to yo get busy. As the saying goes, let any grass grow under your Breed more pure bred horses. better care of them than hereto feed them, care for them and them bigger and better, because far the greatest opportunity the br ers of America have ever had is knocking at their door and it is u you to replenish the world, and t is no state or commonwealth that as great natural resources for the duction of the pure bred horse as souri.

Dean Mumford Says:

"The investments of the farmer which pay the largest interest are the investments in fertilizers, in good livestock, in good machinery and other forms of equipment.

"One of the most important steps which must be taken by the average farmer of the Middle West is the purchase and application of fertilizers to be used along with a rational rotation. ***The intelligent use of fertilizers*** will increase farm profits and benefit directly the individual farmer . . . —Dean F. B. Mumford, University of Missouri, in The September Banker-Farmer.

GETTING INTO THE FIGHT

elow we print the expressions of a ber of our readers on the cam- n which The Missouri Farmer is ing for a great statewide organi- on of farmers. They would fill entire issue if we printed all of n—hence we are merely quoting acts from a few.

W. Hedger, Saline County: "I am earty sympathy with the aims and poses of The Missouri Farmer. I approaching the three score and limit and have been farming prac- lly all that time and have never conditions confronting the far- so gloomy as now and every far- in Missouri should do everything is power to support The Missouri mer in its splendid effort to im- ve these conditions. It's a man's to be sure as any farmer ought to able to see—but I see from every ber of The Missouri Farmer that have men capable of tackling the A few days ago I saw this item he Kansas City Star from a repre- ative of one of the big Packers: e prospects for meat products e never better. The farmers are ing huge profits and there is a pect of a big run of hogs which give a good chance to cut down es.' The English language is in- able of expressing my opinion of statement. But, as the 'Buckshot' n says, it's time to 'get down to ss tacks' and as soon as you go ly to organize the Packing pla nt me in anywhere from $10 to). It's our only show. It's time get busy."

William Butler, Gentry County: ve just read the January 1st issue you are preaching the gospel h to a people who are in Agricul- al bondage. Hope you may prove hful to the end and receive your reward. The enemy is powerful you will have to be as 'wise as a pent', if not as 'harmless as a dove. you can send me some sample ies of the January 1st number I'll to get my neighbors to subscribe. onsider this number so good and ng that it ought to awaken the argic and the dead to life and ac- n. Organization is our only hope.

B. Ingwerson, Pike County: "Your e of January 1st is a corker. You e begun the New Year well. If the mers of Missouri will act on your gestions we will clean up the Bee ist in short order. It has beaten out of more than $15,000 in the 13 years at a conservative esti- te. I inclose a dollar bill for ich please send me as many sample ies of January 1st as you can re. I am going to go after my ghbors at once. The time has come en we must act and there isn't an r to lose."

. L. Buntin, Saline County: "Have d with great interest your recent icles. We have many in this neigh- hood who have lost money on the ent markets. And the worst is come if farmers don't wake up a ke this devil-fish loose. They are king the very life out of the farm nd all because we farmers sit back l allow them to do it. I am for mers' packing plant in St. Louis and such a plant is started I will b d to take some shares—and with est and capable management it l win. I inclose a dollar. I'll l l all I can in my neighborhood."

Henry Millinger, Knox County: "I for a statewide farmers' organiza- n and when you get ready to start packing plant I'll take ten shares tead of one. I think every live ck farmer could afford to do this l be much money ahead. Have ked to some of my neighbors and y feel like I do. It's our only hope o go ahead with all your might l we will be at your heels."

Henry Durst, Palmyra, Mo.: "I like r fight for the farmer for I know at the Packers are doing to us. I ve fed a good many cattle and hogs l have often sat on the fences in stock yards waiting for bids when tle would slump from 75c to $1 per ndred. Organization is our only ance and you can count on me all ng the line."

J. R. Collett, Novinger, Mo.: "You e certainly making a great fight for farmers of Missouri. Some bank ginally sent me your paper and for while I didn't pay much attention it. Then I happend to read the recent article, "What Can We Do?" and it so convincingly showed up the sad plight of us farmers that I waked up—and now you can count on me from this time on. The time has come when something must be done."

W. N. Greene, Jackson County: "I am certainly in sympathy with your splendid fight to better the farmer's conditions. I am president of the Brooking township Farm Bureau and we have organized a farm club in our district and meet every Tuesday evening. Please send us any literature you may have that will help us."

W. B. Gex, Graham, Mo.: "I want to compliment you on the heroic work you are doing to arouse the farmers to organize to secure their rights and I hope you will succeed in binding the agricultural interests of the state into a powerful organization to combat those who seek to criminally exploit them.. Please send literature for Farm Club at once."

Ray L. Sewell, Macon County: "We organized a Farm Club in our district last night with 15 members to start with. Several more would have been out but for the rain. We decided to work in conjunction with The Missouri Farmer and wish you would send a Constitution and By-Laws and other helpful literature. We will meet twice per month and we are going to discuss the Land Bank Bill first."

Vincil P. Crowe, Caldwell County: "Since you are making such a noble fight in the interest of the farmers, it seems that I might at least do what I can in my community. Allow me to express my confidence in your plan of farmers organization. I am a regular reader of your paper and enjoy it immensely and am going to try to get all my neighbors to subscribe for it—so please send sample copies. Also constitution and by-laws for a Farm Club."

J. R. Estill, Howard County: "We are getting ready to organize a Farm Club in our district and any literature you can send us will be thankfully received. Your paper is a great help to me and I appreciate the splendid work you are doing."

J. W. Hunter, Montgomery County: "We met and organized a Farm Club last night, so please send Constitution and By-Laws and other literature at once. Three other school districts south of us organized tonight also—so you see this neck of the woods is getting stirred up pretty well. Please send a bunch of sample copies."

Reo Estep, Clinton County: "Please send Constitution and By-Laws and all other helpful literature to me at once as myself and neighbors want to organize a Farm Club and get busy."

C. W. Cooter, Kearney, Mo.: "The Missouri Farmer is the best farm paper I ever saw and I am going to try to get every friend and neighbor I've got to subscribe for it. I am with you in your great fight."

Gus Bowers, Howard County: "You are sure on the right trail and are doing more for the farmers of this state than any other influence I know of. I also like your Farmers' Market Club which supplies a long felt want. Hope every county will organize."

Lewis T. Pitzer, Scotland County: "I am heartily in sympathy with your great fight for a square deal for the farmer and I will be glad to take some stock in the proposed million dollar packing plant when you get ready to launch it."

B. R. Wybrant, Jr., Ralls County: "We are going to organize a Farm Club in our district, so please send Constitution and By-Laws and other literature which will get our farmers thoroughly enthused in this great movement."

R. B. Marr, Filley, Mo.: "Dear Mr. Ellis. I inclose a dollar. Wish I could send you a thousand. I must see how many of my farmer friends I can persuade to dig up a dollar for your great paper. Farmers must get together. It's our only chance."

F. F. Forward, Randolph County: "We have organized a Farm Club in our district and I wish you would send us Constitution and By-Laws and any other good literature. Any additional information which will help us will be appreciated."

D. A. Lehenbauer, Marion County: "I am very much interested in your fight for a big statewide farmers' organization and think it is the only solution. Our county already has a

(Continued on page 8)

GOOD seed and good soil is only the *starting point* in raising a big corn crop. You can no more afford to plant with an old, worn out corn planter or a complicated new one full of fads and fandangles than you can to plant *poor seed.*

You can't afford to waste your time and labor or *risk your entire crop* with a planter that covers unevenly, misses hills or does not check accurately.

The HAYES Four-Wheel is *guaranteed.* It *must* be all we claim and all you expect. 190,000 users verify that HAYES Four-Wheels regulate depth of planting to the *fraction of an inch.* Corn all comes up at the same time, allows earlier cultivation, an earlier harvest, a *better quality* and *bigger quantity.*

HAYES Four-Wheels guarantee *surer germination* and *quicker growth.* Wheels pack the dirt around the corn to hold the moisture and leave a *ridge of loose soil* on top. Ridge over corn prevents washouts in hilly fields and gives greater surface for sun's heat.

Covers where all ordinary open wheels fail—even in wet and sticky ground. Guaranteed not to clog. Short coupled, light draft and turns in shortest space. *Checks with absolute accuracy,* regardless of team's speed. Cross rows straighter than the way you drive.

The HAYES Drop *never misses a hill.* Simple, reliable and most efficient. Fewer parts, less breakage and delays. Has no clutch to miss and give trouble. *Never cracks or grinds the seed.* Will drop accurately any sized or shaped kernel. *No bare spots* in HAYES planted fields. No replanting necessary. Increased yields soon pay for it.

Thousands in use for years with practically no repair expense and every one giving *time-saving, money-making* service. No complicated parts to get out of fix. Strong construction, *practically exempt from breakage.* No expensive and aggravating delays in the busy planting season. Easy and simple to operate and can be trusted to unskilled help.

Can be furnished with perfect working Fertilizer or Cow Pea Attachments, Stub Runners or Disks.

2000 DEALERS. Ask your dealer or let us prove how this planter prevents corn field waste and increases corn yields. Don't make a mistake. Buy the planter that *guarantees* results.

Free book 'AP' of Planter Facts tells all about the HAYES. Write for it today—a postal, or if you wish a letter, asking any questions on planting problems.

Start Tractor Farming

Bigger Crops—Less Expense—Easier Work

A TRACTOR gives you the power you need to practice best farming methods, plow deep and do all your work in the right way at just the right time, which means bigger crops. Gives you power that doesn't need to stop for rest—power that hot weather and hard ground can't stop—power in a concentrated form that one man can handle. You can't turn a switch and stop a horse eating. But a tractor stops eating when it stops work, and when it is working it costs you less than to feed enough horses to do the same work.

There's a Size Avery Tractor to Fit Your Size Farm

Avery Tractors are built in sizes to fit any size farm. They have sliding frames, double drives, two-speed gears, low speed heavy duty tractor motors, extra large crankshafts, renewable inner cylinder walls, no pumps or fan.

Prices: They are sold at low prices as follows: 3-Plow Tractor, $760 cash; 4-Plow Tractor, $1120 cash; 5-Plow, $1680; 6-Plow, $2145; 8-10-Plow, $2475. Avery "Self-Lift" Plows and "Yellow-Fellow" Threshers are also built in sizes to fit any of above size tractors. We also build a special smaller size tractor for $295 cash. All built and backed by an established company owning a large factory and many branch houses which insure permanent and prompt repair and expert service.

BEGIN THE YEAR RIGHT

We sincerely wish that every farmer in Missouri who is industrious may prosper abundantly during the year 1916. We would be greatly pleased if we of The Missouri Farmer staff could have a share in bringing that prosperity about and we have some good reasons to believe that we can do that very thing if the farmers will let us help them. We get scores of letters from men all over the state who tell us that the paper has been helpful not only from its teaching of good agricultural practice, but from the influence it exerts on the economic problems which every farmer knows he is facing with greater difficulty every year of his life.

In the last issue of The Farmer a letter by Judge Thomas, a well-known lawyer of Southwest Missouri who says of his own free will that he considers the reading of The Missouri Farmer and the studying and following its teachings by his tenants has been worth one dollar an acre profit to him. And Judge Thomas volunteers to say that he is working for his own interests when he subscribes for the paper for each of his tenants who not only read the paper but they study the articles which deal with subjects along their line of farming.

To begin the year right then do our readers think we are much out of the way when we ask them if they will not only see that their paper is paid for at least one year ahead but that they will speak a good word to any neighbor who is not now getting the paper? The fight we are making is the farmers' fight and if we win it is their gain but if we fail it is their loss. So let us all stand together and win the fight.

LET MISSOURI FARMERS LEARN FROM CANADIAN FARMERS

The farmers of Missouri have been too conservative in the adoption of new methods and for that reason they are far behind the farmers of some of the Northern states and the Western provinces of Canada in the business of co-operative selling of grain and the co-operative buying of feed for their live stock. A few co-operative grain companies have been organized in Missouri and report a successful business but the greater the number we can get established, the more powerful they will be in correcting the evils of the Grain Trust.

How through co-operation, grain growers of Western Canada, in the provinces of Manitoba, Saskatchewan and Alberta, have made a profit of $1,600,000 was told by George F. Chipman, Winnipeg, in an address before the National Conference on Marketing and Farm Credits. Mr. Chipman said in part:

"In the past nine years the grain growers of Manitoba, Saskatchewan and Alberta have organized three companies for the handling of their grain. These three companies are now operating 490 country elevators and one large terminal elevator at the great lakes. The total assets of these three farmers' companies are over four and a half million dollars and a paid up capital of one and one-half million dollars. During their operations the farmers have handled through their own companies over 250,000,000 bushels of grain and have made a net profit on their operations of over $1,600,000. This, in brief, is the record of the three western farmers' grain companies, the Grain Growers' Grain Company, Winnipeg; the Saskatchwan Co-operative Elevator Company, Regina, Saskatchewna, and the Alberta Farmers' Co-operative Elevator Company, Calgary, Alta.

"Prior to fifteen years ago the grain trade of Western Canada was in the hands of a few private companies and the Canadian Pacific Railway and was practically without any regulation of any kind. The result of such affairs was disastrous to the farmers, and after investigation by a Royal Commission the grain trade was brought under a certain amount of Government regulation by the Manitoba Grain Act of 1909. This act bonded every grain company so that the farmers were practically certain of receiving payment for their shipments. But it did not remove the chief grievance of the farmers. In 1901 the first Grain Growers' Association was organized as a protest against the unfair condition of the grain trade. The organization first started in Saskatchewan, but it spread like wildfire all over these provinces, and through their organization the farmers carried their protest to Ottawa, where they secured important amendments to the Grain Act. There was still, however, much to be desired and the farmers decided to go into the grain trade on their own account. In 1906 they established the Grain Growers' Grain Company as a commission house, which has since developed into track buying and the operation of 175 elevators in Manitoba and 2,500,000-bushel terminal elevators at Fort William. In 1911 the farmers of Saskatchwan organized the Saskatchewan Co-operative Elevator Company, in which the Government assisted to the extent of 85 per cent of the money required. In 1913 the farmers of Alberta organized the Alberta Farmers' Co-operative Elevator Company on the same lines as the Saskatchewan Company and with the same assistance from the Provincial Government. All of these companies have been successful, and as a result of their operations they have removed a very large portion of the grievances of the grain trade, in addition to this the organized farmers have established their own journal, the Grain Growers' Guide, which in seven years has reached the circulation of over 34,000 copies per week, and which is now the largest farm journal in the Dominion of Canada.

"All of this struggle has not been brought about without a terrific struggle against the forces of the organized grain trade and with considerable self-sacrifice on the part of the farmers. The farmers' companies are now the biggest single factor in the grain trade of Canada, and it is only a matter of a few years when they will market three-quarters of the Canadian grain crop. It is also expected that in the future they will go into flour milling and possibly the operations of their own line of steamships for the transportation of their grain."

SHALL FARMERS HOLD GRAIN?

There is no doubt in the minds of those who have studied the matter and who are unprejudiced and free from personal interest that the practice of farmers selling their grain as soon as harvested and rushing it all to market within a few weeks gives the elevator men an advantage in price making. Farmers are not all in a position to hold their grain and particularly is this true of tenant farmers, but if only those who are able to do so, would store their surplus in their own bins it would prevent the crowding of elevators and mills and the congestion of shipping and hence these conditions could not be used to break the price of grain.

There are some difficulties in the way of farmers holding grain. Often thrashing is done before the grain is dry, or thrashing is done when on account of weather the grain is too damp to store and in such cases it would be disastrous for the grower to try to hold the grain unless he was fixed to dry it out. But eliminating all the wet grain and all that raised by tenants if other farmers who are able to do so would build good granaries and store their grain and then through some organization market the grain about as needed for consumption and export there is little doubt but what they would get a better average price than they do under the present disorganied system of marketing.

In discussing this question at the recent National Conference of Marketing and Rural Credits, Mr. G. W. Lawrence, Secretary of Farmers' Grain Dealers' Association of Kansas, said that the proper place to store surplus grain was on the farms where it was grown instead of elevators, either privately owned or co-operative.

"From the producers' standpoint we ought to store the grain where it will tend to 'Bull the Market.' From the consumers' standpoint we ought to store where it will tend to 'Bear the Market.' From the speculators' standpoint the grain ought to be stored where they can get the most complete knowledge of the supply, and enable

P&O

Diamond Sulky Plows

Made right or left hand, all standard sizes, all styles of bottoms, to meet local requirements. For 18 years the leading riding plow in this country. "It's the Way We Build Them."

High lift, light draft, automatic control and perfect bottom. Removable dust proof wheel boxes with hard oil screw caps. Beam is high in the throat, giving ample clearance in deep plowing. Double bails hold plow steady and rigid, making it run absolutely true and leaving a smooth, level furrow bottom. Only truly automatic rear wheel control ever put on a plow; holds rear wheel rigid regardless of ordinary weaving of team, but allows it to castor naturally on the turn, making a square turn possible.

Collars and linch pins inside the screw caps take end thrust off of boxes. Bottom so hung in frame as to throw weight of plow, dirt and driver all on wheels, insuring light draft. Spring washers prevent nuts from working loose. High grade coulter with chilled cone take-up bearings, and quick adjustable clamp.

Powerful foot lift. Hitch adjustable without removing bolts or pins. Bottom is built on a double ribbed malleable frog, the strongest made; strong in the bend where steel frogs are weak. Different types of P & O bottoms interchangeable. P & O Diamond Plows have every convenience and adjustment for the performance of perfect plowing.

them to best manipulate the market. From the millers' standpoint it ought to be stored where they can cheaply and easily secure their supply. So it will not be strange in discussing this question, if our ideas may differ. But to arrive at a conclusion that is most beneficial to all concerned, I know of no better way than a comparison of ideas or a discussion of the question. First, I desire to express a negative proposition and that is our local co-operative elevator companies are not the proper ones to store grain. We are not organized for that purpose. We have not that in mind when we employ managers, and very few of our managers are properly versed in the handling of options, nor have they time to devote to that line of thought nor the facilities to successfully conduct this line of business, neither are our companies organized with sufficient capital. If the producers desire to handle the storage business on the co-operative plan, let them form organizations for that purpose. At the present time I believe that the most satisfactory place to store the larger part of the surplus grain is on the farm, and by the farmers. By so doing the farmer can market the grain at less expense, doing at least a part of it at the time of the year that work is not so pressing, and in many cases doing it with his own equipment and thereby not feeling the expense.

Exceptions occur where a farmer is located so near market that he can dump his wheat in the elevator or when he is threshing it at a time when he thinks the demand and the price is above the average for the year, or when the need for money is so great that it is a necessity to sacrifice time or grain to raise it. (A condition that we hope to see remedied by our rural credit system.) But our idea is that if we can hold the surplus of grain on the farm until needed, we will equalize the supply to the demand, thus establishing a more uniform and staple price for the crop. Frequently we will save a back haul in freight, save our elevators from the strain that we so often put upon them, to care for our grain while we are forcing it on the market, relieve the situation frequently when we have a scarcity of cars, save at least one commission and the added expense of storage at terminal points.

"I do not wish to convey the idea that I am opposed to terminal elevators, because I am not, and as every one must admit, they are a necessity to the satisfactory handling of the food products of our land, but I do think we have been forcing our grain on the terminal elevators too much to get the best result to either the producer, the shipper or the consumer."

We don't want to force The Missouri Farmer onto anybody—and if you don't want it and don't intend to renew, let us know, when we will stop it. We are playing a square game. We want you on our list of course because we are fighting your fight—but in the last analysis, it's up to you.

BALANCED DAIRY RATIONS

Most feeders of dairy cows can produce protein more cheaply than they can buy it, according to C. H. Eckles of the Dairy Department of the Missouri College of Agriculture. Wise is the man who has a good supply of legume forage on hand from his alfalfa, clover, cowpea, or soybean fields, for the dairy cow cannot do her best on corn, timothy hay, or fodder even with good succulent silage to help maintain summer pasture conditions.

Bran at a dollar a hundred furnishes protein at a cost of about eight and a half cents a pound, while cottonseed at $1.90 a hundred furnishes it at a cost of little over five cents a pound. The cost of producing the protein on the farm in alfalfa, clover, or other leguminous crops varies with local conditions so that no such definite figures can be given, but almost any farmer should be able to supply himself at much less than five cents a pound. If he has neglected to do so, however, he must purchase protein in some form to supplement the abundance of silage and corn which he undoubtedly has on hand under Missouri conditions.

Feeding two pounds of cottonseed meal a day to a cow that has been giving milk on such a ration as corn, fodder, and timothy hay, will increase the flow to a surprising degree. In spite of the many things that have combined to raise the price of cottonseed meal this year, it is probably the cheapest concentrate to buy for this purpose.

Some good dairy rations which Professor Eckles suggests are as follows:

(1)	Corn silage	25 lbs.
	Clover hay	10 lbs.
	Corn	4 lbs.
	Bran	4 lbs.
(2)	Corn silage	30 lbs.
	Alfalfa or cowpea hay	10 lbs.
	Corn	6 lbs.
	Bran	2 lbs.
(3)	Clover hay	20 lbs.
	Corn	4 to 5 lbs.
	Bran or oats	2 to 4 lbs.
(4)	Clover hay	20 lbs.
	Corn and cob meal	5-7 lbs.
	Gluten or cottonseed meal	2 lbs.
(5)	Alfalfa or cowpea hay	10 lbs.
	Corn fodder	10 lbs.
	Corn	5 to 7 lbs.
	Bran	2 lbs.
(6)	Alfalfa or cowpea hay	15-20 lbs.
	Corn	8-10 lbs.

Each of these rations includes a whole day's feed for the ordinary cow, half to be given in the morning and the other half in the evening, but they are not intended for the cow of unusual dairy capacity, or one that is being fed for heavy production, or to make a record. The amounts specified are those to be fed to a cow giving from 20 to 25 pound of milk a day, and cows giving more than this should receive more feed, especially more grain, while those giving less milk should have the grain cut down. The general plan followed is to give each cow all the roughness she will eat, and about one pound of grain for each three pounds of milk produced.

SELF-FEEDERS FOR FATTENING SWINE

The Iowa Station has perhaps done more experimental work along this line than any other station. Among other trials they conducted one where several feeds were placed in separate self-feeders and the hogs allowed to eat as much of each as they desired. The following feeds were used:

Shelled corn
Wheat middlings
Meat meal (60% protein) tankage
Whole oats
Linseed oil meal
Charcoal
Ground limestone
Common rock salt
Water

They found that pigs weighing about 45 pounds at the beginning of the trial, when fed as indicated above, weighed around 290 pounds at the end of the 162-day test. During this time, for each 100 pounds gain, they ate the following feeds:

Shelled corn	372.40 lbs.
Meat meal	27.57 "
Oats	2.53 "
Oil meal	1.15 "
Middlings	14.54 "
Charcoal	.10 "
Limestone	.14 "
Salt	.13 "
Total	418.55 lbs.

The above shows that corn, meat meal, and middlings were the feeds mostly used by the hogs when allowed to eat each at will. The gain obtained was quite satisfactory both as to rate and economy.

The Missouri Station fed two lots of hogs averaging in weight at the beginning about 110 pounds, 56 days on a ration of corn 12 parts, tankage 1 part. One lot was hand fed and for the other a self-feeder was used. The results from this trial show very little difference, either as to rate or economy of gain, indicating that the use of the self-feeder for fattening hogs was as satisfactory as hand feeding.

The Minnesota Station reports as follows upon the results of three trials where the method of self-feeding was compared with hand feeding for fattening swine.

"In all three tests, the self-feeder pigs ate more grain per day, and their daily gains were somewhat larger. On the other hand, the hand fed pigs produced a little more pork for each pound of grain consumed. The self-feeder, then, gives a little faster gains but requires slightly more feed for a given gain."

The above experimnetal work indicates that self-feeders may be used satisfactorily for fattening swine. It can be used, of course, only when it is desired to full feed.

L. A. Weaver,
Missouri Experiment Station.

WORTH TWO $75. SEPARATORS

R-21

Mr. Geo. Rigdon, of Harvard, Mich., wrote me: "I paid $100 apiece for my first two and $85 for my last separator." We sold him a new Galloway Sanitary Bath-in-Oil Cream Separator. He says: "It looks to me like it was built to outwear the other three."

Where other separators are good the New Galloway Sanitary is as good or better. Where others are wrong the Sanitary is right. The best skimming service, the most improved design, the best materials and finish for less money! If the Galloway Sanitary is as good as I say it is, you cannot afford to buy any other kind!

$34.50

If it is not as good as I say, then I could not afford to offer it to you for a ninety-day trial. I couldn't afford to guarantee it for ten years against defective workmanship and materials. You save money when you buy it; you make money when you use it. Try it. If you like it, buy it; if you don't, send it back. That's my selling plan in a nutshell. Shipped from Spokane Omaha Minneapolis, Chicago, Waterloo and Kansas City.

A USEFUL LIFE ENDED

"He has achieved success who has lived well, laughed often, and loved much; who has gained the respect of intelligent men and the love of little children; who has left the world better than he found it, whether by an improved poppy, a perfect poem or a rescued soul; who has never lacked appreciation of earth's beauty or failed to express it; who has always looked for the best in others and given the best he had; whose life is an inspiration, whose memory a beneditcion."

But a few days after receiving a card with "greetings of the season" signed by W. H. Bowker and containing the above quoted beautiful sentiment, news reached us of Mr. Bowker's death, which occurred January 4 at his home in Boston, Mass. Mr. Bowker was only 65 years old, was a graduate of the Massachusetts Agricultural College and had always taken a very deep interest in the agricultural progres of the country.

He was one of the foremost men in this country connected with the business of manufacturing commercial fertilizers, and we have never seen anything in his business methods that would show that he did not consider the farmers' interest and the permanency of agriculture the two things of greatest importance. Why should not all men take this view of life and strive to leave the world better because of their having lived in it.

A DOUBTING THOMAS

A subscriber from Vandalia, Mo., sends us a marked copy of one of the stock yard's dailies calling our attention to a report from La Crosse, Wis., showing the losses of the first large farmers' co-operative packing house established in this country. This friend with an air of "I told you so" seemingly is getting a lot of satisfaction out of the fact that because of bad management that a farmers' plant has sustained a loss during the first few months of its existence. He probably fails to consider that in private business or in stock companies there are failures sometimes. Like too many other farmers our friend depends for his information upon what he reads in his Stock Yards paper, a publication controlled and circulated in the interests of packers and not for a single minute in the interest of farmers and stockmen who are credulous enough to believe that the packers are bosom (?) friends of the farmers.

From reliable sources of information we learn that the principal cause of loss in the La Crosse co-operative packing plant was a mistake made in selecting a manager. When this plant was organized with a capital of $250,000 and with some 2,500 stockholders an independent packing plant was purchased to start with and the man who had been operating the plant was hired at a good salary as manager. The plant had been losing money before it was bought by the co-operative company and it was surely a mistake to place the man in charge of the new company who made a failure of his own business. Not only did they make that mistake but the farmers' company paid $122,000 for the old plant which experts have said was not worth more than $40,000. This is the same old story of farmers allowing themselves to be fleeced by promoters who have no interest in the farmer except to bleed him of his money. All over the United States promoters have played this same game in selling farmers machinery for creameries, canning factories, etc., at from two to four times their worth and then after the farmers were tied up with this expensive outfit they found they had neglected the first and all important thing in the organization, the supply of raw material. The fault is not in the co-operative principle but it is in the unbusiness-like way in which it is taken up and in allowing unscrupulous promoters to get hold of the business.

In this fight against the packers farmers should not allow the paid agents of the packers to get into the organization and defeat their efforts in co-operation. The packers in their own interests can well afford to aid in the promotion of co-operative plants if they can get their own mercenares in as managers and insure the failure of the business. This is about the cheapest and quickest way the packers can kill off legitimate competition.

If stock raisers win in this fight against the packers they must use every available line of attack. In the first place meat producers must change their present methods of selling everything they raise and they must supply the home demand without letting the packer get two profits out of it. There is not a single valid reason why farmers should not cure on the farm every pound of meat needed for home consumption and enough for local markets. At the recent Ham and Bacon Show held during Farmers' Week the quality of the meat ehibited was up to the standard in appearance of any of the packing house meat and the quality was better because as a rule the meat was better cured. This, then we consider the first point of attack and every farmer who raises hogs should kill and cure enough for his own use and whatever he can sell advantageously in his home town. Some may say this is too small a matter to have any effect but that is just where and why we farmers fail. There are some 214,000 farmers raising hogs in Missouri and if every farmer on the average would find a local market for the meat from only five hogs it would mean more than a million head, about one-fourth of all the hogs marketed in one year in Missouri. If the packers' toll is but a dollar a head that would mean a million less for the packers and a million more for the farmers.

In a recent issue we published the statement that the Cudahy Packing Company out of their profits last year distributed a stock dividend of 58 per cent. Last week's newspapers contain the statement that Armour & Company made their high record in profits last year. It is stated that their net earnings on a capital of $20,000,000 last year were $11,156,000 or 55.78 per cent and that the net earnings for the previous year, 1914, were 38.19 per cent. While thousands of farmers have struggled to make a bare living and few have done better than make a net return of 5 or 6 per cent on their investment here are the packers making net profits of 38 to 58 per cent. But that is not the worst of it for they use these millions squeezed out of hard working farmers to hammer down the prices of hogs and cattle at a time when nine feeders out of ten are losing money.

After the slaughtering of enough meat for the home supply and the local market then will come municipal abattoirs, and co-operative packing plants which we will discuss in some future article.

A SKEPTIC AMONG FARMERS

Skepticism and conservatism are probably the two greatest hindrances to progress among the hundreds of barriers we run up against. Farmers are skeptics because they have been so often fooled by the oily tongued society leaches who have so often preyed upon them and they are conservative in their views largely no doubt because their profits are so small that they have little money to invest in untried ventures. It is not surprising to us then when a proposition like the Missouri Land Bank is offered for the benefit of farmers that many of those who would be benefited by the proposed change on account of their skepticism and conservatism should oppose what is, in the light of other countries, bound to be of material help to them.

One of our readers, Judge James M. Rea of Andrew County, writes along this line as follows: "Farmers are both landed and landless, the latter in the majority. Then posing as farmers are the extensive holders of valuable farm lands who do not farm at all but simply farm farmers. Now, won't the Land Bank Bill, you so ardently espouse, play largely into the hands of the latter, the actual landed farmer next and the landless farmer not at all? It is bound to increase the price of land and the landless can't begin to buy land at present prices. So when your bill increases the price of land, rent will advance, wages fall, tenancy and homelessness increase, likewise the rush to the city, which in turn will decrease wages there, drive more men, women and children to the slums. Granting the bill and its adherents to mean well as can be they are on a false scent as farmers—actual farmers so often go.

If the bonds should be exempt from taxation in order to enable them to bear a less rate of interest, why would not exempting all notes and bonds from taxation let all borrowers enjoy a lower interest rate?

Wouldn't that reach landless debtors, tenants, hired hands, and others? Of course it would. Isn't the duty of officialdom to look out for the needy instead of the few?"

The weight of Judge Rea's argument seems to be that lowering the rate of interest will tend to increase the selling price of land and that high prices for land is a bad thing for the country. First, if those who believe in this theory, for it is only theory, have the welfare of the poor man at heart, then why do they not urge a law fixing a higher rate of interest? If a low rate of interest is a bad thing for the borrower then a high rate must be a good thing. We remember very distinctly when only about fifteen years ago our Missouri Legislature passed a law lowering the legal rate of interest to six per cent that about the same argument was made by the money lenders who opposed the change as the opponents of the Missouri Land Bank now make against a lower rate of interest for farm loans. But where could you find a man today who would risk his reputation by advocating raising the legal rate of interest in Missouri back to where it was twenty years ago? Now let us just say to those who sincerely want the farmer to succeed and who are theorizing against the Missouri Land Bank Bill that we who are favoring it are not theorizing or speculating about what it will do but we have plenty of the best of evidence to satisfy even the most skeptical, if he is really seeking the truth, that it will be a good thing for those who are struggling to own a home on a Missouri farm. Land credit based upon the same fundamental principles as the Missouri Land Bank, that is amortization and a low rate of interest, has been in operation in Germany for 150 years and if it is a bad thing why does not the German farmer demand a change? In France, Italy, Ireland, Autralia and New Zealand different forms of the rural credit system have been in operation for many years and who has ever heard of the farmers, the actual home loving, home owning farmers of any of those countries demanding that these laws be repealed. It is about time that theorists like our esteemed friend, Judge Rea, look for the evidence furnished by thousands of farmers of the countries mentioned above who have changed their position from peasant and tenant to landowner and then get in line for the first real measure offered in the interests of the landless class in Missouri, for a great many years. It is no use to obscure this question by raising other questions and by claiming that this measure does not go far enough, but let us adopt progressive measures, one at a time if necessary, for the defeat of one good principle helps to defeat others whenever they are proposed.

GETTING INTO THE FIGHT

(Continued from page 5)

County Farm Bureau—but please send Constitution and By-Laws and other literature describing your Farm Clubs."

Henry Reinwald, Saline County: "You've got the only farm paper I know of that is really standing up for the farmer. We are trying to organize a farmers' elevator at Sweet Springs at the present time. I am in favor of Farm Clubs. The Packers are sure fleecing the Producer and organization is our only hope."

Thus we could continue column after column—but our only purpose is to show our readers how firmly this great new movement has already gotten started throughout the state. In the above extracts we have eliminated most of the fine things which these men had to say about The Missouri Farmer—for without exception they agree that it is the only farm paper they know anything about that is putting up a real fight in the farmer's behalf and that every farmer in the state should get up behind it. Scores of farmers are asking for sample copies in order to raise clubs of subscriptions and this is true almost without exception of the men mentioned above. While it is impossible for us to print one-fourth of the letters we are receiving, we want a word from every farmer who reads the paper. We want to know where you stand from you direct.

WILL THE MISSOURI LAND BANK HELP THE BORROWER?

To The Missouri Farmer:

Believing your sincere desire is to furnish the Missouri farmers with information for the better uplift of and welfare of those engaged in Agricultural pursuits, and as I am one seeking more light in regard to the benefits to accrue to our farmers from supporting and voting for the proposed Gardner Land Bank Law to be submitted at the next general election. Some provision of state or government aid for obtaining a lower rate of interest than is obtained of the land sharks and bankers, while admitting land mortgages are the saftest and best of loans obtainable, is the most needed remedy to help the farming class. All efforts at providing relief for overcoming these extortions of high interest rates have failed in the past, to a close observer, by reasons of the certain obstructed hand of the banker which has prevented legislative action.

I had in possession until recently a printed pamphlet I prized highly, containing the many laws and reliefs given to the farmers of the many foreign countries at rates of interest bearing but 3½ to 4 per cent per annum for aid in the better development of farming interests of those European countries. I have long hoped for such aid in this country which has been promised for ten or more years past by legislative measures.

Now I utterly fail to see the desired relief in the proposed Gardner Land Loan Bank Bill as I cannot see that it materially reduces rates of interest, and the necessary measures of its providing sufficient amount of capital is so insignificant and slow in method to meet and relieve the vast mortgage indebtedness of $112,565,400 that is now the chief burden of our farming classes demanding relief from the extortionary interest rates which must be paid annually.

The Gardner Land Bill, if I understand it, exacts a rate of 5% interest (which should be 3½ or 4 per cent) and other conditions of cost including payment annually of a sinking fund for a stipulated loan to run 20 or 25 years, and the interest that might accrue from these sinking fund payments, these long-time loans would make the farmers loan cost him not less than 6½ per cent, and not sufficient means provided for to meet five per cent of farmers now burdened in our state with farm mortgages. We stand opposed to this pretended Gardner Land Bill for rural loan benefit without more light on the subject.

Nevada, Mo. John W. Layne.

Editor's Reply: In my long experience in dealing with different classes of men I think the fellow who is hardest to understand is the one who tells you he agrees with you in principle but can not go with you because you do not go fast enough or far enough to suit him. Our correspondent says farmers need relief but he can not see any relief in the Gardner Land Bank plan which we have been advocating for the last eighteen months. If our friend will tell us what rate of interest he has been paying and for what length of time he has been able to get a loan then we will be in a position to tell him just about how much this bill will help him, but as he does not do this we will discuss it from average data:

In the first place the state can not fix a rate of interest lower than what would have to be paid for money borrowed on state bonds. Interest rates are lower in the older countries of Europe than they are here and that is true whether it applies to the individual or to the Government. All we can hope to do for the borower here is to get the lowest rate and the best terms of payment consistent with the price of money in this country. The last bonds offered by the State of Missouri were drawn at 3½ per cent but when they were offered for sale the state could not find a buyer and before they were sold it was necessary to allow a commission which made them net 4 per cent. Now in the Gardner Bill the first bonds will be offered at 4.3 per cent. Until a market is established for these Land Bank bonds, we will perhaps be doing very well to sell the bonds at par drawing 4.3 per cent interest. If the bonds should sell for less the profits would go into the reserve fund and may be returned to the borrower under the provisions of the bill. The borrower is charged 4.3 per cent plus one-half per cent to pay expenses which makes his rate of interest 4.8. Interest rates on farm loans in Missouri for the last few years have been anywhere from 5 to 7 per cent and in most cases there is a commission charge when the loan is made and every time it is renewed. Every farm borrower can figure his own saving by taking the difference between 4.8 per cent and the rate he has been paying including the commissions.

But there is another advantage of more value perhaps than the lower rate of interest and that is in the long time and the privilege of paying a small annual payment on the loan After the farmer secures a loan under this plan he need not worry about its renewal for if he can meet the interest and the small annual payment, both of which amount to about what the average man now pays out for interest alone, he will extinguish the entire debt in twenty-five years. Is not that worth while? To have the debt wiped out in twenty-five years and the worry of renewal all removed with it?

Our friend seems to think we can not take care of but a small part of our mortgage indebtednes with the Gardner Land Bank. On the original capital of $1,000,000 the Bank Commissioner can sell bonds and loan to the amount of $40,000,000. And in addition to this he can issue bonds and loan to the amount of $30 for every dollar in the net reserve fund which means that approximately $50,000,000 may be loaned before it is necessary to increase the capital of the bank.

According to the last census report there was a mortgage debt of $112,565,403 on 64,028 farms from which exact data was obtained. But there were nearly 25,000 farms from which the information was not ascertained. It is reasonable to suppose that these farms were mortgaged as heavily as the ones listed. Then to this if we add the mortgages on the 82,958 farms operated by tenants the total mortgage debt on all farms in Missouri is probably not much short of $225,000,000. But let us not get alarmed because every one is not going to avail himself of the privilege of the State Land Bank at once. Already we see the good effects coming from a discussion of rural credits in lower rates of interest and more favorable terms and if we begin loaning money by the Missouri Land Bank it will make itself felt on all other farm loans made in the state. By the time we loan the maximum amount under this bill the United States Government will probably have a rural credit plan in operation or the state can enlarge its own bank and all legitimate borrowers will be taken care of.

The Missouri Land Bank plan is only a beginning as we have so often stated but the men who are too timid to take the first step can not hope to gain anything by opposing this bill because it does not go far enough. Let us take what is offered and when it is offered.

If you have any seed corn, cowpeas, soybeans, clover, timothy or any other farm seeds for sale, you should join our "Farmers' Market Club" at once. This will enable you to sell it quickly.

This Service FREE TO YOU

Now Is the Time

to think about those minor building jobs—hog houses, poultry houses, sheds, feed racks, gates, fences, etc.,—spring will soon be here.

Make your plans now for the coming season.

Prepare adequate protection for your stock.

A building dollar spent in time is sure to save you more than nine!

And when you build, build for SERVICE, build with

Southern Yellow Pine

"The Wood of Service"

the strongest, toughest, stiffest, most durable and most economical wood suited to general farm building and repairs, indoors and out. There's a lifetime of service in it.

Get Our Free Building Plans

We have architects' plans, drawn to scale, with lumber bills and estimates complete, for houses, barns, bins, cribs, and many other farm structures, large and small. They are practical, valuable farm helps, and they are yours FREE for the asking. From any of them your local Southern Yellow Pine lumber dealer can tell you to a dime what it will cost you for any structure, from a hen's nest to an 8-room home. How to Grow Bigger Crops of Superb Fruit FREE

THIS new, big, 4-color book—*just published*—tells you all the facts—tells you how other farmers and orchardists have made fruit trees yield them *big incomes*. It's FREE—just for your name and address sent us on the coupon—or on a postcard, if you prefer.

It will interest, inform, *help* you. Every one of its big 12x9-inch pages illumined with *new* photos (taken from life) of leading fruits, berries, roses and ornamental vines, hedges, shrubs and trees—*printed in Nature's own beautiful colors*. Packed with advice from successful growers that will assist you. Filled with facts that will point out to *you* the way to make *more money* growing fruit. Get this book—

Stark Bro's 100th Birthday Fruit Book FREE

Nurseries at LOUISIANA, MO. Since 1816

A great book celebrating our great year—the One-Hundredth Anniversary of Stark Bro's Nurseries. Published to help every owner of either a home or a commercial orchard. *Get this book to learn how growers get* $12.00 a barrel for apples—$2.70 a crate for peaches—*big* prices for every kind of fruit.

Send Us Your Name and Address
on either the coupon or the postcard. Get the book. Write today.

(Continued from last issue)

CHAPTER XV

"MR. SLOAN SPEAKS"

Wow! Somethin' seems to have kind of livened up the gloom of this dump, seems to me," exclaimed Bill on the following morning, when returning from his regular trip underground, he stamped into the office, threw himself into a chair, and hauled off one of his rubber boots preparatory to donning those of leather.

Dick had been bent over the high desk, with plans unrolled before him, and a sheet of paper on which he made calculations, whistling as he did so.

"First time I've heard you whistle since we left the Coeur d'Alenes," Bill went on, grinning slyly, as if secretly pleased. "What're you up to?"

"Finding out if by sinking we couldn't cut that green lead about two hundred feet farther down."

"Bully boy! I'm with you!" encouraged the older miner, throwing the cumbersome boots into the corner, and coming over behind Dick, where he could inspect the plans across the angle of the other's broad shoulder. "How does she dope out?"

"We cut the green lead on the six-hundred-foot, at a hundred and ten feet from the shaft, didn't we? Well, the men before us cut on the five-hundred at a hundred and seventy from the shaft, and at two-twenty from the shaft on the four-hundred-foot level, where they stoped out a lot of it before concluding it wouldn't pay to work. It was a strong but almost barren ledge when they first came into it on the two-hundred-foot level. The Bonanza chute made gold because they happened to hit it at a crossing on the four-hundred-foot level. At the six-hundred, as we know, it was almost like a chimney of ore that is playing out as we drift west. If the mill had not been put out of business, we were going to stope it out, though, and prove whether it was the permanent ledge, weren't we?"

"Right you are, pardner."

"Well, then, at the same angle, we would have to drift less than seventy feet on the seven-hundred-foot level to cut it again, and at the eight-hundred-foot we'd just about have it at the foot of the shaft. Well, I'm sinking, regardless of expense."

"It might be right, boy, it might be right," Bill said, thoughtfully scowling at the plans, and going over the figures of the dip. "But you're the boss. What you say goes."

"But don't you think I'm right?"

"Yes," hesitatingly, "or, anyway, it's worth takin' a chance on. Bells used to say the mines around here all had to get depth, and that most of the ledges came in stronger as they went down. The Cross ain't shown it so far, but eight hundred feet ought to show whether that's the right line of work."

"How is the sump hole under the shaft?" Dick asked.

"Must be somewhere about seventy or eighty feet of water in it; but we can pump that out in no time. She isn't makin' much water. Almost a dry mine now, for some reason I don't quite get. Looks as if it leaked away a good deal, somewhere, through the formation. There wouldn't be no trouble in sinkin' the shaft."

"And thirty feet, about, would bring us to the seven-hundred-foot mark?"

"Yes."

"Then I'll tell you what I want to do: I want you to shift the crew so that there is a day and a night shift. The rebuilding of the dam can be put off for a while, except for such work as the millmen are agreeable to take on. I want to sink! I don't want to waste any time about it. I want to go down just as fast as it can be done, and when we get to the seven-hundred-foot, one gang must start to drift for the green lead, and the others must keep going down."

He was almost knocked over the desk by a rousing, enthusiastic slap on the back.

"Now you're my old pardner again!" Bill shouted. "You're the lad again that was fresh from the schools, knew what he wanted, and went after it. Dick, I've been kind of worried about you since we came here," the veteran went on, in a softer tone of voice. You ain't been like the old Dick. You ain't had the zip! It's as if you were afraid all the time of losing Sloan's money, and it worried you. And sometimes—now, I don't want you to get sore and cuss me—it seemed to me as if you mind wa'n't altogether on the job. As if the Cross didn't mean everything."

He waited expectantly for a moment, as if inviting a confidence; then, observing that the younger man was flushed, and not looking at him, grinned knowingly, and trudged out of the office, calling back as he went: "There'll be sump water in the creek in half an hour."

As if imbued with new energy, he ordered one of the idle millmen to act as stoker, if he cared to do so, which was cheerfully done, had the extra pump attached, saw the fire roaring from another boiler, and by noon the shaft rang with the steady throb of the pistons pounding and pulling the waste water upward. The last of the unwatering of the Cross was going forward in haste. By six o'clock in the evening he reported that soundings showed that the map had not been checked up, and that the shaft was seven hundred and ten feet deep, and that they would commence a drift on the seven-hundred-foot mark the next day.

Dick was awakened at an early hour and found Bill missing. He went over to the hoist house, where a sleepy night man, new to the hours, grinned at him with a pleasant: "Looks like we're busy, just—the—same, Mr. Townsend! The old man"—the superintendent of a mine is always "the old man," be he but twenty—"left orders last night that when the water was clear at seven hundred feet he was to be called. He kicked up two of the three men at four this mornin.' and they're down there puttin' the steel into the rock ever since. Hear 'em? He's makin' things hump!"

Dick leaned over the unused compartment of the shaft, and heard the steady, savage chugging of the drills. Bill was "makin' things hump!" with a vengeance.

A man who had been sent to the camp for the semi-weekly mail arrived while the partners were at breakfast, and the first letter laid before them was one with a New York postmark, which Dick read anxiously. It was from Sloan, who told him that he had been unexpectedly called to the Pacific coast on a hurried trip, and that, while he did not have time to visit the Croix d'Or, he very earnestly hoped that Dick would arrange, on receipt of the letter, to meet him in Seattle, and named a date.

"Whe-e-w! You got to move some, ain't you? Let's see, if you want to meet him you'll have to be hittin' the trail out of here in an hour," said Bill, laying down his knife and fork. "What do you s'pose is up? Goin' to tie the poke strings again?"

Dick feared something was amiss. And he continued to think of this after he had written a hasty note to Joan, telling her of his abrupt absence, and that he expected to return in a week. He pondered for a moment whether or not to add some note of affection, but decided that he was still under her ban, and so contented himself with the closing line:

"I am following your advice. We are sinking!"

He had to run, bag in hand, to catch the stage from Goldpan, and as it jolted along over the rough passes and rugged inclines he had a medley of thought. Sometimes he could not imagine why Sloan had been so anxious to talk with him, and in the other and happier intervals, he thought of Joan Presby, daughter of the man whom he had come to regard as antagonistic in many ways.

The confusion of mind dwelt with him persistently after he had boarded the rough "accommodation" that carried him to the main line, where he must wait for the thunderous arrival of the long express train that was to carry him across the broad and splendid State of Washington. Idaho and Oregon were left behind. The magnificent wheat belt spread from horizon to horizon, and harvesters paused to waive their hats at the travelers. The Western ranges of the Olympics, solid, dignified, and engraved against the sky with their outline of peak and forest, came into view, and yet his perturbation continued.

He saw the splendid panorama of Puget Sound open to his view, and the train, at last, after those weary hours of jolting, rattled into the long sheds that at that time disgraced the young giant city of the Northwest. It was the first time he had even entered its shadows, and as he turned its corner he looked curiously at the stump of a tree that had been hollowed into an ample office, and was assailed by the strident cries of cabmen.

"The Butler House," he said, relinquishing his bag into the hands of the first driver who reached him, and settled back into the cushions with a sense of bewilderment, as if something long forgotten had been recalled. He knew what it was as he drove along in all that clamor of sound which issues from a great and hurrying city. It was New York, and he was in the young New York of the Northwest, with great skeleton structures uprearing and the turmoil of building. Only here was a difference, for side by side on the streets walked men clad in the latest fashion, and men bound to or coming from the arctic fields of gold-bound Alaska. Electric cars tearing along at a reckless speed, freight wagons heavily laden, newsboys screaming the call of extras, and emerging from behind log wagons, and everything betokening that clash of the old and the intensely new.

At the Butler House the man behind the desk twirled the register toward him, and assigned him a room.

"Sloan?" he replied to Dick's inquiry. "Oh, yes. He's the old chap from New York who said he was expecting someone, and to send him right up. I suppose you're the man. Here, boy, show Mr. Townsend to five-fifty. Right that way, sir."

And before his words were finished he had turned to a new arrival.

The clamor of the streets, busy as is no other city in the world busy when the season is on, was still in his ears, striking a familiar note in his memory, and the modernity of the elevator, the brass-buttoned boy, and the hotel itself brought back the last time he had seen Mr. Sloan, and the day he had parted from his father in that office on Wall Street. He found the Wall Street veteran grayer, much older, and more kindly, when he was ushered into the room to receive his greeting. He subsided into a chair, but his father's old-time friend protested.

"Stand up!" he commanded, "and turn around, young fellow, so I can see whether you have filled out. Humph! You'll do, I guess, physically. I don't think I should want to have any trouble with you. You look as if you could hold your own most anywhere. I'm glad. Now, sit down, and tell me all about the mine."

He listened while Dick went into details of the work, sparing none of the misfortunes and disappointments, and telling of the new method employed. He was interrupted now and then by a shrewd question, an exclamation, or a word of assent, and, after he had finished the account, said: "Well, that is all there is to report. What do you think?"

"Who is Thomas W. Presby?" Sloan's question was abrupt.

"The owner of the Rattler, the mine next to us."

"He is?" the question was explosive. "Ah, ha! The moth in the closet, eh? So that accounts for it! I spent a hundred dollars, then, to good purpose, it seems to me!"

Dick looked an intent and wondering question.

"An agent here in Seattle wrote me that they had written you, making an offer of sixty thousand dollars for the property—yes—the same one you wrote me about. He said they had reason to believe I was the financial backer for the mine, and that they now wished to deal with me, inasmuch as you might be carried away by youthful enthusiasm to squandering my hard-earned cash. I wrote back that your judgment satisfied me. Then, just before I left, I got a flat offer of a hundred thousand dollars for the property in full, or seventy-five thousand for my share alone. It set me to thinking, and wondering if some one wasn't trying to cut your feet from under you. So, having business in Portland, I came on up here, and got after this agent."

Dick had a chill of apprehension. He knew before the loyal old man had proceeded half-way what to expect.

"It cost me a hundred dollars in entertainment, and a lot of apparent readiness to talk business, to get him confidential with me. Then I got the name of the would-be purchaser, under injunctions of secrecy, because those were the agent's positive instructions. The man who wants to buy is Presby!"

For one black, unworthy instant, Dick looked out of the window, wondering if it were possible that Joan had known of her father's efforts, and had withheld the information. Then the memory of that gentle face, the candid eyes, her courageous advice, and—last of all—the kiss and prayer on her lips, made him mentally reproach himself for the thought. But he remembered that he still owed affection and deference to the straunch old man who sat before him, who had been his benefactor in an hour of need and backed faith with money.

"Well, sir," he said, turning to meet the kindly eyes, "what do you think of it?"

"Think of it? Think of it?" Sloan replied, raising his voice. "I'll tell you my answer. 'You sit down," I said, 'and write this man Presby that I knew no one in connection with the Croix d'Or but the son of the man who many times befriended me, in desperate situations when I needed it! That I was paying back to the son what I was unfortunately prevented from paying back to the father—a constant gratitude! That I'd see him or any other man in their graves before I'd sell Richard Townsend out in that way. That I'd back Dick Townsend on the Croix d'Or as long as he wanted me to, and that when he gave that up, I'd still back him on any other mine he said was good!' That's what I said!"

He had lost his calm, club poise, and was again the virulent business man of that Wall Street battle, waged daily, where men must have force or fail to survive. Dick saw in him the man he was, the man who at time had shaken the financial world with his desperate bravery and daring, back in the days when giants fought for the beginnings of supremacy. He felt very inexperienced and young, as he looked at this veteran with scars, and impulsively rose to his feet and held out his hand. He was almost dumb with gratitude.

"I shouldn't have asked you to say so much," he said. "I am—well—I am sort of down and out with it all! I feel a little bit as I did when the Cornell eleven piled on top of me in the annual, when I played half-back."

"Hey! And wasn't that a game!" the old man suddenly enthused, with sparkling eyes. "And how your father and I did yell and howl and beat the head of those in front! Gad! I remember the old man had a silk hat, and he banged it up and down on a bald head in front until there was nothing but a rim left, and then looked as sheepish as a boy caught stealing apples when he realized what he had done. Oh, but your Daddy was a man, even if he did have a temper, my boy!"

His eyes sparkled with a fervid love of the game of his college days, and he seemed to have dismissed the Croix d'Or from his mind, as if it were of no importance. Nor did he, during the course of that visit, refer to it again. He made exception, when he shook hands with Dick at the train.

Don't let anybody bluff you," he said. "Remember that a brave front alone often wins. If you fail with the Croix the world is still big, and—well—you're one of my legatees. Good-by. Good luck!"

Again Dick endured the rumbling of trains through long hours, the change from one to another at small junctions, the day and night in a stage coach whose springs seemed to have lost resiliency, and the discourse of two drummers, Hebraic, the chill aloofness of a supercilious mining expert new to the district, and the heated discussions of two drill runners, veterans, off to a new field, and celebrating the journey with a demijohn. The latter were union men, and long after he was tired of their babel they broached a conversation which brought Dick to a point of eager listening.

"Yes, you see," one of the men asserted; "they got the good on him. Thompson had been a good delegate until he got the finger itch, then he had an idea he could use the miners' union to scratch 'em. He held up one or two small mines before the big guns got wise. That got him to feelin' his oats, and he went for bigger game."

"But how did they get him?" the other runner insisted.

"They got him over here to where we're goin'—Goldpan. He held up some fellers that's got a mine called the Craw Door, or somethin' like that. Fetched three of his pals from Denver with him. They called 'emselves miners! God! Miners nothin'! They had worked around Cripple Creek long enough to get union cards, but two of 'em was prize fighters, and the other used to be bouncer at the old Alcazar when it was the hottest place to lose money that ever turned a crooked card. I remember there one time when—"

"Nobody asked you about that," growled the other man. "What I'm interested in is about this big stiff, Thompson."

"Him? Oh, yes. Where was I? Well, he fixed things for a hold-up. Was goin' to get these fellers at the Craw Door to untie their pokes, but they don't stand for it. He packs a meetin' with a lot of swampers that don't know nothin' about the case, and before they gets done they votes a strike, and an old feller from this Craw Door gets his time. Gets kicked to death, the same as they uster in Park City when the Cousin Jacks from the Ontario cut loose on one another. The Denver council takes cawgnizance of this, and investigates. It snoops around till it gets the goods. Then—wow! bing! goes this here Thompson. They sue him themselves, and now he's up in Canon City, a-lookin' plaintive like through these things."

He held his knotted, rough fingers open before his face, and jerked his head sideways, simulating a man peering through penitentiary bars. Then, with a roar, he started in to bellow, "The union forever—hooraw, boys hooraw!" in which his companion, forgetting all the story, joined until it was again time to tilt the wicker-covered jug.

And so that was the end of Thompson and presumably the strike, Dick thought, as he settled back into the corner he had claimed. And it was easy to see, with this damning evidence to be brought forward, that Bells Park's murderers would pay, to the full, the penalty. For them, on trial, it meant nothing less than life. He was human enough to be glad.

The stage rattled into Goldpan, and, stiff and sore from his journey, he began his tramp toward the trail of the cut-off leading homeward: He stopped but once. It was in front of the High Light, where a small scrap of paper still clung to the plate glass. On it was written, in a hurried, but firm and womanly, handwriting:

This place is closed for good. It is not for sale. It has held hell. Hereafter it shall hold nothing but cobwebs. Lily Meredith.

The date was that of the tragic night, the night when Bells Park, fighting for those on whom he had bestowed a queer, distorted affection, had been kicked to death by the ruffians now cowering in a distant jail!

Verily the camp and the district had memories for him as he trudged away from its straggling shanties, and filled his lungs with the fresh, free air from the wide, rugged stretches beyond. When he came through the borders of the Rattler he looked eagerly, insistently, for a glimpse of his heart's desire, and thought, with annoyance, that he did not so much as know the cabin which she called home. But he was not rewarded. It was still the same, with no enlivening touch of form or color, the same spider-web tramways debouching into the top of the mill, the same sullen roar and rumble of falling stamps, the same columns of smoke from tall chimney and humble log structure, alike, and the same careless clash of the breakers.

Bill came hurrying down the trail to meet him, waving his hat, and shouting a welcome. Up at the yard the smith held a black hand and muscled arm up to shade his eyes from the last sunlight, and then shook a hammer aloft. From the door of the engine room the man who had been Bells' assistant bawled a greeting, and the fat cook shook a ladle at him through the mess-house window. It all gave him an immense and satisfactory warmth of home-coming, and the Croix d'Or, with its steadfast, friendly little colony, was home in truth!

"We're in sixty feet on the seven-hundred-foot," Bill grinned, with the air of one giving a pleasant surprise, "and say, boy, we've hit the edge of ore. You were all right. The green lead is still there, only she looks better to me than she did before, and I know rock, some."

There was nothing wanting in the pleasure of his return, and the last addition to that satisfactory day was a note he found, lying on the very top of other letters awaiting him. It was from Joan Presby, and Bill, starting to enter the office, saw his partner's face in the light of the lamp, smiled affectionately, and then tiptoed away into the darkness, as if to avoid intrusion at such a time.

(Continued in next issue)

Control of the Bag or Basket Worm.

If you would save the arbor vitaes, red cedars, maples, and other trees and shrubs, pick off the long brown slender silken cases or cocoons which dangle from their twigs and branches, and burn them. This will destroy the well-known bag or basket worm which is now in the egg stage within the cases, according to T. J. Talbert of the Missouri College of Agriculture. This pest is often a great deal more destructive than canker worms, San Jose scale, and other pests. Each bag or case may contain from 700 to 1200 eggs which during next May an June will hatch into as many hungry caterpillars.

The bag or basket worm is one of the most common and injurious insect pests in the parks and plantings of the larger cities and towns of Missouri. In many cases it is doing more harm to shrubbery and shade trees than all other insects combined. If the proper measures of prevention are put into practice, it is, however, one of the easiest insects to control.

A simple way of destroying the pest is to collect the cases or bags during the fall and winter and burn them. If this work is thoroughly done, the eggs of the insects will be destroyed and the pest may be completely stamped out.

Since the caterpillars that hatch from bag-worm eggs are leaf-eaters, they may be destroyed by the use of arsenical poisons. When the worms are small or just emerging from the bag-like cases during May and June they may be killed easily by spraying the foliage thoroughly with arsenate of lead paste at the rate of 3 pounds to 50 gallons of water. This spray should be applied just as soon as the pest begins to feed in the spring. Later sprays may require more poison. During the summer, sticky bands placed around the trunks of the trees will protect them from the caterpillars which wander at this season.

The kind of a fight which The Missouri Farmer has been making during the last few months enables us to see what kind of stuff there is in our readers. It shows up those who are willing to fight—and those who are "past kicking"—who are content to keep on drifting down stream.

The Red Side Wall and Black Tread

This handsome design and color combination, the trade-mark "red and black," now distinguishes Firestone Tires and gives distinction to any car.

You have become used to Firestone sturdiness and toughness, which means "Most Miles per Dollar."

You have learned to expect that Firestone resiliency will give you easiest, most reliable riding.

Now you have the greatest possible style and fine appearance which can be built into a tire.

HANDLING THE FARM FLOCK

Every line of work has contributed its part to the advancement and civilization of the world, but we feel that poultry has done more than many other things, for the sale of poultry and eggs has made it possible for many boys and girls to go to school, who would not otherwise have had the opportunity.

When this country was new, the hen was of great value for she furnished food to the pioneer to tide him over in time of famine between feasts. As the country becomes more densely populated and the method of farming changes from the extensive to the intensive, we find the hen and her products are all the more important.

Last year the poultry and poultry products in the State of Missouri amounted to more than $52,000,000, or more than a million dollars each week, and we say without hesitation that it is the best method of distributing money there is in existence, for practically every dollar of it goes to the exact place where it is needed, and that is to keep up the expenses of the home. The fowl is also more universally grown by people of all nations and climates than any other animal. Recognizing the importance of poultry and its general distribution, it is well to give its production some study. The poultry breeders of the state have recognized the value of organization and have therefore organized the Missouri State Poultry Association which is composed of 6,000 poultry breeders who now bear the distinction of having the largest state organization in the United States.

The great value of poultry and eggs does not come from the exclusive poultry farms, but from the flocks upon farms where other lines of work are carried on. There is no farm properly equipped without a nice flock of hens. Just how large the flock should be depends upon many conditions, the principal ones being: The amount of range the birds have and the amount of feed they get on the range.

The greatest value of a flock comes from the birds getting their living by picking up shattered grain which would otherwise be lost, or by catching insects which are injurious to crops.

Various estimates have been made as to the number of hens which should be kept on a farm. As the number depends greatly upon the stock fed about the barn, we believe that this will partly determine the number of fowls kept. Under ordinary conditions where the fowls have the freedom of the farm and are permitted to get the shattered grain, leaves of hay, etc., about the barn, we believe that about 25 hens for each horse and cow kept is the most economical number to keep.

One mistake too often made is keeping unprofitable birds in the flock. All birds with crooked backs, wry tails severely injured in any way or very old birds should be culled from the flock for they are not usually profitable and therefore reduce the profits of the rest of the flock.

The old method of hatching from a promiscuous flock is rapidly disappearing. The better plan is to select a pen of the best females and place them in a pen with a good male and do all the hatching from this pen. Where the flock is reproduced by doing the hatching with hens, we find this error often made. The hens which lay through the winter season are the best hens on the farm and are the first to go broody in the spring. About the time these hens go broody, the hens which loafed all winter have begun to lay. Therefore, the farmer being anxious to hatch some early chicks, sets the good hens on the poor hens' eggs. The better plan is to select the breeders at this season and at breeding time place them in a pen and make the poor layers raise chicks from the good winter layers. If this is done, no male is required with the outside flock which reduces the cost of feeding, and if breeding males are purchased each year, much will be saved for the number of males will be reduced. Then, too, the same mating will do for two years.

The two-year old hen is the best age for breeding purposes. Her chicks are larger and stronger than those from pullets.

Prince Albert paves the way

for men to get a new and cheerful understanding of how good a pipe or rolled cigarette can be. If you *think* you can't smoke a pipe or a makin's cigarette; if you are taste-tired, we tell you Prince Albert will bring you back without any fuss or feathers—quick! R. J. REYNOL TOBACCO CO
Winston-Salem, N.

Fifteen females in most breeds can be mated with one male. A male placed in a pen where there has been no male, the eggs will become fertile in about three days and will remain fertile for about three weeks after the male is removed.

The only serious problem connected with this method is balancing the ration for the hens in the pen. The egg is made in three principal parts, the yolk, the white, and the shell, and made out of three different kinds of feed. The yolk is made principally of fat-forming foods, the white of protein and the shell of minerals, principally lime. The lack of either kind of feed will limit the egg yield. The tendency too often is to feed too much yolk material and not enough lime.

The following shows an unbalanced and a balanced ration for egg production:

Unbalanced Ration	Yolks	Whites
100 lbs. Corn	255	134
100 lbs. Wheat	243	182
20 lbs. Oats	39	31
20 lbs. Bran	31	41
20 lbs. Shorts	41	44
20 lbs. Corn Meal	50	27
Totals	659	459

Balanced Ration	Yolks	Whites
100 lbs. Corn	255	134
100 lbs. Wheat	243	182
20 lbs. Oats	39	31
20 lbs. Bran	31	41
20 lbs. Shorts	41	44
20 lbs. Corn Meal	50	27
20 lbs. Beef Scraps	21	221
Totals	680	680

It will be seen that the unbalanced ration produced more fat than albumen and would therefore be a good fattening ration. The grain (corn and wheat) should be fed in the litter, one pint in the morning and one quart in evening, to ten hens if penned. Amount of range, size of breed, season, etc. will influence quantity of feed consumed. As fat or yolk material produces heat, it should be increased during winter and decreased in summer.

The mash should be in hopper where the hens can eat at any time. Oats may be fed with either grain or mash. One-half pound of fine table salt and two pounds of fine charcoal should be added to each one hundred pounds of mash. Grit and oystershell or ground limestone should be before the birds at all times. Water serves the two-fold purpose of being made part of the egg and softening the feed for digestion. Therefore, fresh water should be before the fowls constantly.

THE POULTRY MITE

Everyone knows the gray poultry mite which takes on a distinct reddish cast after the meal of blood. It is commonest in dark, damp, dirty poultry houses where it thrives upon filth and the logical remedies recommended by T. J. Talbert, of the Missouri College of Agriculture, are sunshine, ventilation, and cleanliness. The hen house should be so constructed that it can easily be kept clean and that there will be no cracks or crevices in the roosts or elsewhere to furnish hiding places for the mite during the day time when they are not on the fowl

ey feed at night, crawling from wl to fowl, so that one infested bird ay introduce them into the entire ck.

Sunshine is one of the best disinfects as well as a great foe to the te, and it should be given access to st as much of the hen-house as posle. Regular spraying with kerone emulsion, strong tobacco solns, or commercial stock dips will lp greatly. Commercial lime sulur and miscible oils put on the arket in such form that they will x readily with water for use in raying orchards are also helpful in mbating the mite.

One application is not enough and e spray should be repeated in about week in order to kill the young hich may have developed from the gs laid about the roosts or in the h before the first spraying. It ould be applied with sufficient force penetrate all cracks and crevices. Kerosene emulsion properly prered at home will give as good reits as anything which can be purased. Mr. Talbert gives the followg directions for making it: "Disve half a pound of laundry soap, or ound of lye soap, in a gallon of soft ter; take the solution off the fire d add two gallons of kerosene bee cooling. Mix them thoroughly by urning ten or fifteen minutes and e one part of the emulsion to eight nine parts of water when ready to ply.

One part boiled lime sulphur made actly as for orchard spraying may mixed with eight parts of water, d the commercial stock dips may be ed in accordance with printed dictions usually furnished with them. rong tea made by boiling tobacco ems in water gives good results, and itewashing should not be neglected. Spray pumps of many different sizes d types will give good results. cket pumps, knapsack sprayers, and tomatic sprayers will be useful in e garden and orchard as well as in e hen-house, although a longer hose extension rod will be needed in the chard. A barrel pump or power rayer may be used with good results it is already on hand, but is more pensive than the average farm eds for hen-house work.

SIZE AND SHAPE OF AN EGG

Much has been said about high cords made by hens in the egg layg contests as well as records made hens in the yards of poultry breeds. The number of eggs produced is t all that should be considered, for egg to be of value should be of od size and shape, and be covered th a sound, smooth shell.

It is indeed very fortunate for the ultry industry that hens' eggs are l so near the same size. The eggs the different breeds in the contest this place varied in weight from 2.03 ounces to 2.29 ounces, while the hens themselves averaged in weight from 3.12 pounds to 6.36 pounds, and strange as it may seem, the hens whose eggs averaged 2.03 ounces averaged 5.75 pounds, while the ones whose eggs averaged 2.29 ounces averaged only 3.40 pounds each. In fact, we find that the size of the hen has little or no influence on the size of an egg. A four pound hen will lay an egg the same size as an eight pound hen.

After studying the poultry business from every angle, one recognizes the fact that the size and shape of an egg is the one thing all breeders can work for, for it is the only thing in common with all breeds and varieties.

In poultry shows, the breeders of the various breeds and varieties cannot enter a free-for-all competition on size, shape, color, comb, earlobes, shanks, or any other characteristic, for they are not the same with different breeds, but the size and shape of all eggs should be the same. Therefore, this is one of the most important points to be considered in breeding.

An ideal egg should be an oblong oval slightly tapering from one end to the other and should weigh 2 1-6 ounces, or 26 ounces to the dozen. Egg markets require them to weigh at least 24 ounces to the dozen. Eggs of this size and shape are the correct size to fill the standard egg case filler, and if incubated, will give better results than where various sizes and

shapes are incubated together. The old idea that round eggs hatch pullets and the long eggs hatch cockerels is incorrect, for a hen lays uniformly shaped eggs regularly which hatch approximately an equal number of cockerels and pullets.

Nothing can be told from the size and shape of an egg whether it is fertile or infertile, or whether it would hatch a cockerel or a pullet, but the shape of an egg is a characteristic which is transmitted to the offspring. Therefore, use as breeders only the hens which produce eggs of correct size and shape.

By Old Jim Riley

I am sure that Gen'l Sherman never had tha "grip", 'cause if he had a had, he wouldn't have sed what he did about war. Talkin' about things that are ketchin, judgin' by tha things that have bin goin' on at tha White House during the last couple uv years, it must be as full uv love germs as a hound pup is uv fleas in August. It's about time for the ground hog filosofers to crawl out uv their holes agin.

BUCKSHOT BY THE PROFESSOR

After all, I'd just about as leave take my chance in the trenches over in Europe as to go up against an infernal case of "grip" over here in the peace loving U. S. A.

Everybody dead over in your school district—or just sleeping? Why not organize a Farm Club? Why not stir things up a bit?

The only time you can tell that some people are alive is when you cross the path of their selfishness. Then they raise a "holler" that you can hear over in the next township.

I don't belong to the "peace at any price" bunch by a whole lot but on the other hand, I don't want to see this Country converted into a place where the rattle of the sword drowns out the whirr of factory wheels and the music of the self-binder.

Have you sent the editor that dollar for three year's renewal yet? Better do it today—because then he'll cancel all past due subscription and start you into the New Year with a clean bill of health. Just think! For one dollar you will be able to read my "dope" until January 1918! Ain't that a bargain?

No other set of men have the resources and the power possessed by the farmers of the U. S.—and when they permit the Packers or anybody else to make a "door mat" of them, it's their own fault. They are really not entitled to much sympathy.

Seems to me the government might give a fellow who goes up against the "grip" and comes out of it alive, some kind of a medal like they do over in Europe when a fellow gets his lungs shot out—or has been run over by a 42-centimeter gun or something like that.

As long as blood is thicker than water, just so long will it be mighty difficult for a whole lot of perfectly good people to keep their neutrality on straight.

You can't raise a full crop of anything unless you get a full stand. It looks like any blamed fool ought to know this—and yet when you consider how many still depend on the "good lookin' ears," apparently a lot of them don't.

A fellow who lives in the woods way down on the Arkansas line sent the publisher a dollar the other day and said, "You can't tell me nuthin' new about farmin' and I don't really need your paper—but I just want to see what that fool professer feller and old Jim Riley will have to say durin' the next three years." Well now, if it wasn't for one thing, I'd feel real complimented. This man shows a high order of ntelligence—but I don't mind telling him that there isn't a ringboned, knock kneed, flea bitten old blind mule in creation that I wouldn't rather be hitched up with than old Jim Riley.

Makes Hens Lay

Many who have used Dr. Hess Poultry Pan-a-ce-a say that it makes hens lay better than any other tonic they have ever used. Better drop a line to Dr. Hess & Clark, Ashland, Ohio, and ask them for full particulars. Mention The Missouri Farmer.

P&O

Reversible Disc Harrows

Especially adapted to work in vineyards and orchards, and are just as efficient as the ordinary harrow in the open field. They are simple and very strong. "It's the Way We Build Them."

No. 2 Disc Harrow with Short Frame.

Gangs can be quickly reversed for out or in-throw simply by releasing a lever strap, swinging gangs around and replacing strap. Solid or cut-out blades. The No. 2 Reversible is made with short, medium or long frame, and with 8, 10 or 12 discs, 16, 18 or 20 inch. The No. 3 Reversible is made with a short frame, 6 discs, and 16, 18 or 20-inch discs. Tongue Truck is furnished when wanted. It can also be equipped with scrapers and Bull Tongue Center Cut.

Pony Disc Harrow with Shafts.

The P & O Pony Disc Harrow is built especially for use on truck farms, in orchards and vineyards, and for general discing where a small harrow is wanted. Can be furnished with pole or shafts, and with 6 discs, 16, 18 or 20-inch. Equipped with scrapers.

DRY SALT MEAT CURING

We prefer a hog that will dress at least 200 pounds, as that gives us a ham of good size and quality. The dressed hogs are not cut up until entirely cooled out, but we always avoid having them frozen. When the meat is cut and trimmed it is scattered out on boxes or benches and dry salt sown over it, not much, but enough to just whiten it well. This is to start drawing the blood from the lean meat and the joints, which it will do in one or two days, and then the real work of salting is done. We use a tub or box to do the salting in, and in this place at least half a bushel of coarse salt. Begin with the shoulders, placing a shoulder in the tub or box and rubbing it all over with salt, skin side and all, working the salt well into the shanks, ends and sides of the piece, taking plenty of time to do the work thoroughly. As each piece is salted, it is packed down in the box or cask, if the latter be sure to provide holes in the bottom for drainage, as the soaking of the bottom pieces in the bloody brine drawn out by the salt, always means strong meat.

Before placing any meat in the cask or box, put about half an inch of salt over the bottom, and, as each layer of meat is packed scatter salt liberally all over it, filling the cracks well. Pack shoulders first, hams next, and bacon sides on top, and less salt may be used on the sides, but it is well to remember that meat is all worth 12 to 15 cents per pound and salt costs at most $1.50 per 280 pound barrel.

We have no rule as to how long the meat is to lay in this "first salt;" if small two weeks will do, if larger twenty to twenty-five days, and at the end of this time it is taken up, the old salt shaken off and shoulders and hams re-salted exactly as was done the first time, only that we do not use nearly as much salt, the sides not being resalted at all.

Ten to fifteen days is the usual time the meat is allowed to lay in "second salt;" if allowed to lay longer no harm will result, but we think that too long a time in second salt tends to make ham and shoulder meat rather dryer when cooked.

When hanging the meat up to smoke we brush off all loose salt as this prevents the smoke coating the meat well and it is this coating of smoke that helps preserve the freshness of the meat as well as to protect it from insects.

We use maple, hickory or walnut wood to smoke with and build smoke fires every morning for three weeks or more, or until the meat is uniformly smoked a light brown.

Before the flies come in spring we smoke another day, and on the next day take down the meat, wrap each piece well in paper, place in sacks, two to four pieces in a sack, and hang the sacks to the rafters in the smoke house.

This is all; no borax, no saltpeter, no sugar, no pepper, nothing but meat and salt, and in more than fifty years experience, never a spoiled pound of meat. Once in a while we practice some new method with a few pieces, but the meat cured by the old process, which has been used in our family for more than 100 years, is so much better flavor that we never have found anything to beat it. C. D. Lyon.

Some Helps for Butchering

Lever for Hanging: Mr. Ed. F. Neidel of Dittman, Mo., writes that he has found the following contrivance a great help. A good solid post set very firmly in the ground with two cross pieces fastened at right angles near the top to hang hogs on. Fasten a lever pole on top of post, the pole fastened on with iron pin so it will turn from side to side. A short chain with hook is fastened to short ends of lever pole, then by fastening the chain to gambrel stick one man at the long end of the lever can lift a big hog and swing it either way so it can be hung on the cross arm.

[Mr. Neidel sends a sketch of this arrangement but it is not sufficiently plain to reproduce. But we understand it to be two strong 2x4 pieces bolted at right angles near top of post. With this arrangement four hogs, one to each arm could be hung around the post or more if the cross arms were strong enough to hold them.]

Galvanized Barrel for Heating Water: Mr. F. D. Hussey of Platte County writes that he has found that one man can handle the butchering in this manner: Have a platform for scraping made on runners or a stone boat will do. Get a galvanized barrel then have a blacksmith make out of an old wagon tire a band that will go over the barrel say one-third up—not quite to large part. Then have iron legs welded on this band so it will hold the bottom of barrel high enough to put a fire under it. Next take three 2x6 pieces bolted together at the top which makes a tripod to set over the barrel. Get a small block and tackle (the wire stretcher kind) and fasten to top of tripod. With the block and tackle one man can then lift the hog in and out the barrel with ease. When hog is ready for hanging raise with block and tackle and swing to hanging pole one end of which it attached to the tripod. By using two chains one for holding pole when first hanging and the other on pole when one is removed and slipped along the hanging pole.

By sending us a dollar for three years renewal at once, we will cancel all past due subscription and date you three years ahead from this time. That will start you in with a clean slate—and you will be contributing your mite toward the great fight we are making for a "square deal" for the farmer.

LYON'S PRACTICAL FARM PAPERS

Here it is 1916 and no severe winter weather yet, but the weather bureau tells us that the average temperature for December was the lowest in ten years, that for 1914 excepted.

The Ohio river reached near the danger line of 50 feet at Cincinnati twice during December, once about the 15th and again on the 31st, so it may be seen that we have had some rain, yet we have had so little hard freezing that the fields are not very soft. Nearly all the corn is in the cribs, some shock corn still standing, and the price is 65 cents per bushel.

Our son-in-law and daughter, from eastern Illinois, are home on a visit, and he tells us that their big snow of Christmas day, caught him with 1000 bushels of corn to husk yet, the 2500 bushels in his cribs representing his own work as it was impossible for them to get hands. He made this 3500 bushels of corn on 70 acres and did all the work himself, plowing more than half of it five times, besides growing and harvesting 40 acres of oats, yielding him a crop of 2000 bushels.

We are putting our manure upon the wheat this winter, the first time we ever did so, and some of the neighbors think we are crazy. Well, perhaps we are, but we look at it this way: there is only eight acres of the wheat, and we have sown it thickly to timothy, intending to sow red clover in March.

It lays close to the barns, and in such shape that if we get a heavy stand of grass and clover in 1917, we can either pasture it down, or mow it for hay, break it again in 1918 instead of letting it lay until 1919, and hope to make at least 60 bushels of corn per acre from it. Our favorite practice is to break sod for corn, sow the corn stubble to small grains, seed to timothy and clover and let this grow two years, a perfect "four year rotation," but we have practiced this so long, and with such good results as to increasing fertilty, that we can now risk breaking a field twice in succession, or cut the rotation short one year.

That riot among the half civilized people of the old world, is going to cut our supply of agricultural potash short this year, and this is going to work a hardship upon us farmers who use commercial fertilizers. We use lots of potash, not only in tobacco fertilizer, but in that used on the corn crop, and this year, instead of a 4 to 6 per cent goods, we will have to put up with 1½ per cent. Our tobacco stalks contain 3 to 4 per cent, but as yet no one has invented a machine to grind them fine enough to drill, so we scatter them thinly over the fields, always with results comparable to those attained from a liberal application of manure. As I write, January 4, 8 p. m., the mercury stands at 58 degrees; it is clear, and a brisk wind is blowing from the south. I predict colder weather soon. C. D. Lyon.

Feeding Value of Kafir Grain.

A reader from Barton says he has quite a good crop of blackhull kafir and that he has had no experience in feeding it and would like to have our opinion as to its relative value as compared with corn for feeding various kinds of live stock.

We have had no extensive experience ourselves with feeding kafir grain but what we have had has been very satisfactory. Kafir may be substituted for corn in feeding most any kind of stock and a rough estimate will be to count on about 90 per cent of gain from feeding a hundred pounds of kafir that may be obtained from feeding a hundred pounds of shelled corn. The kafir is eaten just as readily by all kinds of stock as corn is eaten but the grains get very hard and better results will be obtained if the kafir is ground. Where the animals are not full fed very good results are obtained by feeding the kafir in the head without thrashing.

Kafir is coming into more favor every year as a poultry feed and on the farm as good a way as any is to feed it to the poultry in the head. Scratching the grain out of the heads will give the hens some exercise and will save the expense of thrashig.

A little time taken now to study the seed catalogues may mean a good garden next summer.

FINE SEED CORN

Yellow Corn: Reid's Yellow Dent, Shenandoah and Gold Mine crossed, Berry's Perfection, Funk's 90-Day Yellow. 90-day White Cap Dent. White Corn: Boone County White, Johnson County White, St. Charles White, Iowa Silver Mine. Prices per bushel, F. O. B. Skidmore. Butted and tipped by hand, graded and tested, $2.50; over ten bushels $2.40; 20 bushel lots $2.30. Sacks free. Crated ear corn, $5 per bu.; 5 bushels or more $4 per bu.

Winnings: 1904, First on best six varieties in entire show at World's Fair held at St. Louis in 1904. Prize gold medal. 1913, First on 10 ears yellow at Maryville, State Show; grand shampion ten ears in young men's class. 1915, First and second a Missouri State Corn Show.

A. F. Howden, Skidmore, Mo.

SEED CORN

Johnson County White, the best I ever grew and all in crib by Nov. 1. Price low this year, $2.25 single bushel, $4 for two bushel bag shelled. Crated $3 a bushel, extra selected ears. Order early.

VALUE OF GOOD SIRES

Probably no parade in the world has ever represented so many prize-winning and state and world-record animals bred by one educational institution as that seen by Farmers' Week visitors at the College of Agriculture of the University of Missouri at Columbia last week.

The parade was to show that what the College of Agriculture has done, with a few good animals, any individual breeder of moderate means may do. The entire Hampshire flock, for example, was bred from three Hampshire ewes, and the Holstein herd, one of the finest in the country, was descended from three cows purchased for about $500 in 1902. This herd now includes thirty-six cows that could not be replaced for $10,000 and that have produced surplus stock which sold for $6,218 in cash, while the milk more than supported the herd.

The parade was led by Honoroble the imported Percheron stallion—a sire of many prize winners—followed by sixteen other draft horses. Among these was Josephine 32,564 and three of her foals which are owned by the College of Agriculture. Three others have been sold for $1,100.

Among the dairy cows was Grace Briggs, probably the holder of the world's long-distance record. So far as is known, no other cow has ever equalled her production of nearly 112,000 pounds of milk and 6,000 pounds of butter in sixteen years that she has been in milk. She was bred by the dairy department of the college.

With the exception of one animal, all the Hereford cattle in the parade were those raised on the University farm. The larger part of the herd is descended from two cows purchased in 1904.

Among the sheep, the most striking lesson was in the exhibit of the different crosses of a medium-priced purebred ram and grade western ewes. The daughters and grand-daughters of the typical, ninety-pound western ewes looked so much like the purebred sheep that in many cases they could hardly be distinguished.

The entire parade was designed to show the value of good sires on the stock farm.

A four-year-old Holstein cow, Ormsby Jane Segris Aaggie, No. 150943 whose picture is shown above is one of the great cows of the world. She is owned by Oliver Cabana, Jr., Buffalo, N. Y. She freshened the first time at the age of two years and ten months; was put in official test and made a record of 17 and 24-100 pounds of butter and 437 pounds of milk in seven days. Freshened again at four years of age and made a test of 22 and 94-100 pounds of butter and 535 pounds of milk in seven days. After her third calf she made the following great record: 1 day 7.29 pounds butter, 100.5 pounds of milk; 7 days 44.42 pounds butter and 721.5 pounds milk; 30 days 180 pounds of butter and 3050 pounds of milk. She weighs about 1500 pounds and is the ideal dairy type.

LOSS FROM OX WARBLES

Most men who have had any considerable experience in handling cattle will readily recognize the presence of the ox warble in the backs of cattle if they will just take the time to examine the animals, but this is too often neglected. Until recently warbles were not regarded as serious, says the Department of Agriculture, because it was thought that the loss they occasioned came principally from the damage they did to hides. Even this loss in the aggregate, however, is important, as hides show warble holes three to six months in the year and dealers pay from 50 cents to $1.50 less for hides that show even moderate warble infestation. In many cases the scars left after the holes have healed cause buyers to cut prices considerably.

The loss from the warble, however, is by no means limited to the holes the maggots cut in the hides. Extensive investigations in Germany and Denmark indicate that the losses through reduction in milk supply in dairy cattle, the retardation of growth in young stock, and the loss of flesh in all classes of animals are twofold greater than the damage done to the hides. In some of these tests the early extraction of the grubs from the backs of infested cattle resulted in an increase of nearly 25 per cent in the milk production. Animals from which the grubs had been extracted showed a gain of more than 5 per cent in weight over similar animals in which the pests were allowed to develop normally.

Thus far the veterinarans and entomologists of the Department have determined no better way of controlling these pests than through the systematic extraction and destruction of the grubs from the backs of infested animals.

When the larvae are nearly ready to leave their host they may be easily squeezed out by pressing the swelling with the fingers, but if not so far developed it is often very difficult to get them out by squeezing. In such cases a slender pair of forceps may be used for pulling them out. If the swelling and its opening are still very small the best way of extracting the grub is to make an incision with a knife, after which the grub can be squeezed out by applying strong pressure. Kill the grub when removed.

It is important that warbles be removed as early in their development as possible. This relieves the infested animals from the irritation and prevents the enlargement of the exit holes. While this practice is not applicable to ranch conditions it is easily put into effect on small farms and in dairies. In the Southern states the herds should be gone over early in December, and about twice later at monthly intervals. In the Northern states the extraction should be begun six weeks to two months later. If no grubs are allowed to drop to the ground and reach maturity the number appearing in cattle in subsequent years will be materially reduced, and if extraction is followed up for several years almost complete eradication will result. Of course it is important where possible to get concerted action among the stockmen in the destruction of these pests.

In extensive experiments along this line in Germany it was determined that the cost of removing all of the warbles from the backs of cattle during one season was about three cents per head. In this case men were employed especially to do the work.

Investigations conducted by the Department indicate that eradication also may be accomplished by the use of arsenical dips, which are extensively employed at the present time for destroying cattle ticks. The arsenical dip appears to act not upon the well-developed grub beneath the skin, but upon the eggs or the newly hatched larvae, probably the latter. It is not unlikely that the destructive action of arsenical dips upon warbles is more or less dependent upon the fact that arsenic is stored up in small quantities in and upon the skin of cattle which are repeatedly dipped in arsenical dips.

Hundreds of farmers from all over Missouri have written us saying, "I am under many obligations to the bank for introducing me to your fine paper which I wouldn't be without for four times the price"—or words to that effect.

A few moments spent at the telephone talking to some of your good neighbors will enable you to send us a "Special Club" of three "Market Club" subscriptions—and you will have your own "Market Club" subscription free for the trouble.

Send No Money

—In Advance on This Great 60 Days Feeding Offer

I want every farmer and stockman to see for himself, **before he pays,** what SAL-VET will do for his own farm animals. I want you to see how it will destroy the ravenous destructive worms that are eating the high priced feed which should go to nourish your animals—how it will stop your losses from worms—how it will aid digestion making your stock thrive better—grow faster—gain in weight and value. I want to prove my claims right on your own farm before you pay me a cent. You take no risk whatever.

The Great Worm Destroyer **SAL-VET** ***The Great Live Stock Conditioner***

TRADE MARK REG. U.S. PAT. OFF.

SAL-VET is not only superior to other preparations for ridding stock of worms and aiding digestion, but is also the cheapest; costing only $\frac{1}{12}$ of a cent a day for each sheep or hog and only $\frac{1}{3}$ of a cent a day for each horse or head of cattle. Requires no dosing—no drenching—no starving—no trouble to feed. It is a medicated salt but without antimony. Simply give your farm animals free access to it and THEY DOCTOR THEMSELVES. I want to send you enough to last all your stock 60 days. I want to show you results before you pay a penny. I get thousands of letters like these:

"When I began feeding SAL-VET to my pigs, they were very wormy, coughed a great deal, and some were runts. I have now fed SAL-VET for about seventy days, and I assure you these pigs look different. They are all in fine condition, and there is not a scrub in the bunch."
GEORGE THORNTON, Rt. No. 2, Brooklyn, Wis.

"Our sheep became infested with stomach worms and were dying almost daily. Reading of the remarkable cures accomplished by SAL-VET I decided to try it. Much to my surprise I have not had the loss of a single sheep since. SAL-VET does exactly as you claim."
JOHN E. TEMPLIN, Blanchester, Ohio

(247)

Send No Money—Just the Coupon

Now fill out the coupon—tell me how many head of stock you have and I will supply you enough to last all your stock 60 days; you pay the freight charges when it arrives and feed it according to directions. If SAL-VET does not do what I claim and you make a specific report in 60 days, I'll cancel the charge; you won't owe me a penny. Address **SIDNEY R. FEIL, Pres.,**

THE FEIL MFG. CO., Chemists, Dept. 82 . CLEVELAND, O.

Prices
Each 40 lb. pkge. $2.25
Each 100 lb. pkge. 5.00
Each 200 lb. pkge. 9.00
Each 300 lb. pkge. 13.00
500 lbs. 21.12
No orders filled for less than 40 lbs. on this 60-day trial offer. Shipments for 60 days' trial are based on 1 lb. of SAL-VET for each sheep or hog and 4 lbs. for each horse or head of cattle. Thousands of dealers sell SAL-VET at above prices but in the far West and South the prices are a little higher on account of the extra freight charges.

"I have not lost a hog since I began feeding Sal Vet. My neighbors all arounnd me have had their hogs die. I will never do without it."—J. T. Deatherage, Ink, Mo.

"Sal Vet" is the best worm destroyer for colts and hogs I have ever used. Am very well pleased with it."—E. J. Douglass, McBaine, Mo.

"Just as you claimed, Sal-Vet is the best worm destroyer one can use. It expelled worms from my horses after other remedies had failed."—R. B. Gaines, Braggodocio, Mo.

THE FEIL MFG. CO.
Dept. 82-1-15-16 [Cleveland, Ohio
Supply me enough SAL-VET to last my stock sixty days. I agree to pay the freight, feed it as directed, and will then pay for it if it does what you claim. If it fails and I so report specifically in 60 days, you are to cancel the charge and I will owe you nothing.

SAM JORDAN'S "SAY"

It occurs to me that next fall a "pure-bred sire" campaign should be made through all the Ozark counties. At every stop I attempt to organize pure-bred sire clubs of from four to six members each, and each club organized for the purpose of securing a pure-bred bull of the type decided upon. There are many breeders of pure-bred cattle who simply make beef steers of the bull calves rather than try to find a market for them as bulls. These calves could be sold at a price that would be better than beef prices and they would do great service in improving the herds of South Missouri. Cattle feeders from the north come to South Missouri to buy stock cattle but the grades are so scrubby that it is impossible to pay for them what better bred cattle would readily bring. These clubs could be kept in touch with each other and exchanges could be made as conditions might seem to warrant. A bull could thus be kept as long as he might be serviceable.

Sam Jordan.

TRAPPING SKUNK

The Missouri Farmer:

I note your promise to help those who need information about trapping fur animals. I have been trapping for skunk and have had no success. Please help me out. Eugene C. Duncan, Scotland County.

Skunks are one of the easiest, if not the easiest, of all fur-bearing animals to trap. First, locate the den. You can tell whether it is used by the fur-bearer by examining the sides and bottom of the entrance. If inhabited you will discover long black or black and white hairs—sometimes pure white. After the burrow is located, all that is necessary is to place the trap at the entrance to the hole. It does not even have to be concealed, although it is best to do so.

Do not take up your trap if you catch an animal, thinking there are no more there. I have seen dens with as many as fourteen skunks in them.

One of my favorite methods is to construct small three-sided pens in vicinity of the dens and in the back part of the pen place a piece of bloody meat. In my trapping I always use Animal Attractor for skunks and trail scent. This costs but 65c per bottle postpaid and can be had by writing the Animal Attractor Co. Stanwood, Iowa. Warm nights, especially if misty, are best for taking the skunk. In extremely cold weather the animals den up, and do not travel about much.

G. J. Thiessen.

Bridge's Bros.' Initial Poland China Sale

Attention is directed to the advertisement of Bridges Bros., Slater, Mo., in which they announce that on Friday, February 11th, they will hold their first public sale of Poland China bred sows and gilts.

Perhaps no firm has been watched with keener interest by breeders and others connected with Poland China interests than has been accorded this firm. The Bridges boys—there are four of them—drifted into the hog business in the most natural way possible. For a long time they had been sending market topping hogs from their feed lots, and because of the marked excellence of their stock (they always used pure bred blood) their neighbors began calling on them for boars. Finally the demand grew to such proportions that they were forced to go into the pure bred business to supply it. They recognized the value of the best and set about to get as good as the breed afforded. A great deal of time and money and thought went into the selection of their foundation stock and it is pretty generally conceeded that their herd will rank with the really good ones of the state.

This is their first sale, and is made up for the most part from the produce of their purchases. Forty head will be sold and will consist of 8 tried sows, 7 fall yearlings and 25 spring gilts, and taken as a whole it is one of the most uniform, attractive, desirable and well bred lots to be sold in Missouri this year. We don't remember having seen a nicer lot of spring gilts than we saw in preparation for the coming sale. All of the offering is bred to one or the other of the three herd boars now in service, Long Wonder Timm 75708, the top boar of Sigel Brown's fall sale, a son of the celebrated Long Wonder and out of a daughter of the 1125-pound grand champion of Nebraska, Big Timm; Bridges' Bob Wonder 76481, a son of Big Bob Wonder and out of the top sow in Walter's 1915 spring sale and Model Big Bone 3rd 76482, a son of the great boar, Long Big Bone, and out of a Big Bob dam.

The breeding of these three young boars can not be improved upon and they are just the kind of individuals that one would expect from such great blood lines. Space does not permit extended mention of all the good things in the sale but readers in the market will do well to keep their eyes on the fall yearling by Long King's Model. She has wonderful size and bone and everything one looks for in a real brood sow. Another fall yearling of exceptional quality is No 12, in the catalog. A February daughter of Sterling Prince is good enough to go into any herd. The Big Bob Wonder gilts out of a Moore's Halvor dam, are right in every way. Others by Big Bob, Long Jumbo II, Blue Valley Expansion, Longfellow Sampson, Longview's Master Orphan, a son of the $2500 Grand Master make the offering particularly attractive. Send for catalog now, and watch this paper for more details.

W. A. Baker & Son's Annual Big Type Poland China Sow Sale

Readers of this paper will be interested to read the announcement of W. A. Baker & Son, pioneer breeders of big type Poland Chinas. This reliable firm will hold their annual sale at Butler, Mo., Friday, February 18th and will offer, as usual, 50 head of very superior bred sows and gilts.

No herd in Southwest Missouri, or indeed, in the state, is better known than this one and the annual February sales are as regular as ground hog day—and as much looked forward to.

This firm has long made a practice of showing at the leading fairs of the middle west and to attempt to give a list of their winnings would require too much space. Suffice it to say, they usually get their share, which is evidence that the kind of hogs they are producing are the kind that win. We have been familiar with this herd for several years and give it as our opinion that this year's offering is easily the best they have ever raised. We make this statement because we are confident that more size, considerably more bone, and the same quality are more pronounced this year than ever before.

The offering will consist of 10 tried sows, 20 fall yearlings and 20 spring gilts. A number of the tried sows have been drafted from the private herd and are among the choice producing sows owned by Messrs. Baker. The 20 fall gilts make up a very attractive lot. They possess plenty of size and bone and show that degree of quality that is also a hall mark of the Baker kind. The 20 spring gilts are largely the get of Big Bone's Son Jr. and furnish eloquent proof of the value of this splendid boar. Among the attractions that have been put in are two under a year gilts by Major B. Look. One of these gilts won first in class at Topeka and Hutchinson and was reserve champion at one of the shows. She is a very high class gilt in every way and will be among the very top gilts sold in any sale. A junior yearling by Big Look and out of Susie Hadley 2nd is another cracking good one. This gilt has produced a litter.

Several of the spring gilts were on the show circuit last fall and two that were in the money everywhere shown are cataloged. Practically all the offering is sired by Big Look, and Big Bone's Son Jr. Both boars are prize winners and proven sires. Big Bone's Son Jr. was shown at five big shows in 1914 and was first and champion at two, first at one, second at one, and third at one. He was shown again in 1915 with marked success, winning as a senior yearling at Sedalia. Two new boars will figure in the offering this year, one, Jumbo King 77152 by Big Long Jumbo and out of a Long King's Equal dam is one of the real good prospects the writer has seen, the other boar, Missouri King 77259 is an Expansion bred boar recently purchased in Iowa because he came up to the Baker standard. The offering is immune and first class in ever way. Send for the catalog and watch this paper for more particulars.

Dowden and Partridge Sell Durocs at Maryville, February 11th.

Friday February 11th, Dowden and Partridge will sell at Maryville, Mo., 40 head of Duroc sows and gilts. This firm maintains two large herds and each year they select the tops for a bred sow sale. This year's offering, as stated above, will consist of 40 head, including 20 tried sows and yearlings and 20 spring gilts. The offering throughout is a very attractive one and those of our readers who are in the market for good useful Durocs will be serving their own interests if they arrange to attend this sale. Perhaps the most attractive sow to be sold is the good daughter of the great sire, Defender. This sow, while not overly large, has more size than is usually found and the fact that she has proven to be a good producer should make her particularly sought after. There are a number of excellent brood sow prospects among the twelve daughters of Grand Model 5th. Grand Model 5th, one of the herd boars now in service, is a splendid son of the noted Grand Model, grand champion boar at Iowa, Minnesota and South Dakota in 1914. Grand Model 5th was shown this year at the Nebraska and Missouri State Fairs and at each show he was placed

W. Z. BAKER'S GREAT SALE OF BIG TYPE POLANDS

RICH HILL, MISSOURI, TUESDAY, FEBRUARY 1, 1916

1913 Show Record at Topeka, Hutchinson, St. Joseph, Sedalia and Kansas City, 17 Firsts, 19 Seconds, 7 Thirds, 3 Fourths, 9 Championships and 3 grand championships,

1915 Show Record at Topeka, Hutchinson, Sedalia and St. Louis: 17 Firsts, 25 Seconds, 27 Thirds, 13 Fourths, 12 Fifths, 6 Sixths, 11 Championchips and 2 Grand Championships.

Owing to a change of location I find it necessary to materially reduce my herd. Many sows I am cataloging would not be for sale if it were possible for me to keep as large a herd as formerly.

40 HEAD--20 TRIED SOWS AND YEARLINGS--20 SPRING GILTS

Every one bred deep in the blood of champions. AS SPECIAL ATTRACTIONS I am selling JOSIE'S BEST, HADLEY'S BEAUTY 2nd, 1913 grand champion (shown above), HADLEY'S LILY, MISS LOOK and other prize winning sows and gilts. The entire offering is immune. This is the opening sale of the season and will afford an excellent opportunity to secure show prospects for 1916. Send now for catalog and plan to be my guests February 1st. Sale in town. R. P. Royce will represent this paper.

W. Z. BAKER, - - RICH HILL, MISSOURI

BRIDGES BROS. INITIAL SALE OF POLAND CHINAS

SLATER, MO., FRIDAY, FEBRUARY 11

40 HEAD TRIED SOWS and GILTS

We announce this sale feeling confident that our offering merits the patronage of breeders and farmers who are in the market for big type Poland Chinas. In establishing this herd we have selected only such individuals from the leading herds of Missouri, Iowa, Kansas and Nebraska as were outstanding. It is the produce from these foundation animales that we are offering and the sale will contain daughters of A Wonder, Big Bob, Big Bob Wonder, Long Jumbo 2nd, Major Look, Pawnee Price, Long King's Model, Trusty King, Sterling Prince, Blue Valley Expansion, Longfellow Sampson and a number of outstanding granddaughters of Grand Master. The offering sells bred to our three herd boars, LONG WONDER, TIMM, BRIDGES' BIG BOB (shown herewith) and MODEL BIG BONE 3rd, a trio of young boars the equal of any in breeding and individuality. We breed and feed for size and you will find spring gilts weighing around 400 pounds and yearlings above 500 pounds. Sale will be held in town. Every animal immune. We have a small mailing list, therefore if you want a catalog drop us a card. R. P. Royce will represent this paper and will handle mail bids with fairness. Keep the date in mind and watch the next issue of this paper.

BRIDGES BROTHERS, Slater, Mo.

AUCTIONEERS: HARRIMAN & SPARKS

W. A. Baker & Son's Annual Poland China Sow Sale. . . . .

50 HEAD

10 tried sows
20 fall yearlings
20 sp'ng gilts

BUTLER, MISSOURI, FRIDAY, FEBRUARY 18th, 1916

Following our usual custom we will hold our annual bred sow sale on the above date and will offer the buying public 50 head of real big type Poland Chinas—"the Baker kind"—the kind that wins for us and will win for you. We believe that our 1916 offering is easily the best that we have ever raised--more size and bone. Many of these sows and gilts are prize winners and all are bred along the same lines as all our wjnners.

The major portion of the offering is sired by BIG BONE'S SON JR. and BIG LOOK—all our own breeding. They are bred to Big Bone's Son Jr., Big Look, Jumbo King and to Missouri King.

THIS OFFERING IS IMMUME. Sale will be held in heated pavilion. Send for catalogue; mention this paper

W. A. Baker & Son Butler, Mo.

Auctioneers: R. L. Harriman and Clyde Robbins.
R. P. Royce, Fieldman.

3rd in his class, and it might be added that at Nebraska there were 26 junior yearlings in the ring. Other sows in the sale are, a daughter of Col. Protection, one by Chief Select 2nd, one by S. & C's Golden Model, one by Select Gano, 15 daughters of Crimson Col., a son of King the Col., 3 by Crimson Echo, and 4 by Mozingo Chief. Most of the lot are bred to one of the two boars, Grand Model 5th and Model Chief by the Champion S. & C's Valley Chief. However a variety of breeding is offered as there will be some bred to Crison Col., Echo's Climax, Crimson Model and Select Gano.

The entire lot are immune and will be presented in tip top breeding condition. The sale will be held in town in a heated sale pavilion. The catalogs are now ready for mailing and will be sent to all who apply. We will have more to say in regard to this offering in our next issue. R. L. (Bob) Hill, secretary of The Missouri Duroc Breeders' Association, will represent this paper at the sale and will be glad to handle mail bids for our readers or to assist them in any way in making their selections.

Baker's Sale of Poland China Sows

W. Z. Baker, the well-known Poland China breeder and exhibitor, of Rich Hill, Mo., announces that on Tuesday, February 1st, he will offer a select draft of bred sows and gilts.

Mr. Baker is making a change in location and because of the fact that he will operate a smaller farm it is necessary to materially reduce his herd. The offering will therefore include a number of his private herd sows that otherwise he would not sell, and further, in order to make the sale especially attractive he has decided to sell practically his entire 1915 show herd.

For a number of years past, Mr. Baker's herd has figured prominently in the best shows of the Corn Belt and a brief review of his winnings would show a record that any breeder might well envy. In glancing through the show record of this herd we find that during the campaigns of 1913 and 1915 it won a total of 20 championships, 5 grand championships, 34 first prizes, 44 second prizes, 34 third prizes, 16 fourth prizes and six sixth premiums. These prizes were won at Topeka, Hutchinson, St. Joseph, Sedalia, Kansas City and St. Louis.

The draft will consist of 40 head—20 tried sows and yearlings and 20 spring gilts. To give our readers an idea of the quality of the offering it might be well to note a few of the animals listed. No. 1 in the catalog, Hadley's Beauty 2nd, was the grand champion sow at Sedalia and the Royal in 1913. Mr. Baker informed us that this sow had farrowed 66 pigs in her last 6 litters, and that he has shown 9 of them and won on all—one was a champion. She sells bred to King Blaine, grand champion at St. Louis. No. 2, Josie's Best, a 2-year-old daughter of White Sox Chief, was grand champion at St. Louis. She is a splendid individual and a producer of the kind most sought after. No. 3, Hadley's Lily, by King Hadley, is a very attractive sow. No. 6 was the champion under a year gilt at St. Louis. Two other tried sows that are listed are Miss Look, the dam of King Blaine, and Miss Wonder.

Most of the spring gilts are by King Hadley and King John—both prominent winners at Sedalia, the American Royal and St. Joseph. Incidentally, this sale will be the last opportunity to secure the blood of these two boars, as they both died last summer. Send for the catalog and arrange to attend the opening sale of the season. R. P. Royce will represent this paper and will handle mail bids.

Things Worth Knowing

Here are some things worth knowing about the advertisements in this issue. The Southern Pine Association will send you a free book of plans on farm homes, barns, hog houses, chicken houses, feed racks, farm gates, etc. It is free for the asking and every farmer should have a copy. If you are in need of a good incubator, you will find a number of the very best advertised in this issue. Likewise, if you are going to do any fencing or need any new farm implements you should study the ads carefully for they all come from reliable concerns.

Dowden and Partridge

ANNUAL DUROC SOW SALE

Maryville, Mo., Friday, February 11

40 Bred Sows and Gilts 40

EVERYTHING IMMUNE

On the above date, at Gray's Sale Pavilion, we will hold our annual bred sow sale. Our offering this year is replete with the most popular blood lines of the breed. Included in the same are daughters of Defender, Col. Protection, Grand Model 5th Crimson Col., Chief Select 2d, and other noted boars. The offering will feature the blood of

Grand Model 5th

a prize winning son of Grand Model.

If you want size and bone and quality combined to a high degree in Durocs that will make you money attend this sale.

CATATOGS MAILED ON REQUEST

DOWDEN & PARTRIDGE

MARYVILLE, MO.

COL. W. M. PUTMAN, Auctioneer. R. L. (Bob) HILL, Fieldman.

Last Call for Taylor's Col. Wonder Duroc Sale

This is the last opportunity to call our readers' attention to the sale of Durocs to be held at Olean, Mo., Friday, January 21st. Last week during the meeting of the Missouri Duroc-Jersey Breeders' Association the writer saw Mr. Taylor, and he stated that he never had a bunch of hogs do better than the sale offering has done. This is good news, but it was to be expected. The coming sale will be Mr. Taylor's second public sale and he is again featuring the get of his remarkable herd boar, Col. Wonder. The offering will consist of practically fifty head of sows and gilts. Most of the offering will be tried sows and yearlings, only 10 head of spring gilts will be offered. Everything cataloged is either sired by Col. Wonder or is bred to him or one of his sons. The entire 1915 show herd of sows with the exception of Col. Wonder's Dream, are included.

Further, Mr. Taylor has gone rather deep into his breeding herd and has cataloged a number of sows, any one of which would be an attraction. For instance, a litter mate to Col. Wonder is listed, as well as a litter mate to Col. Wonder's Dream. No herd in the Corn Belt stands higher than Mr. Taylor's herd, and because of the excellent blood that has been concentrated it produces a very uniform and high class lot of Durocs. We know of no sale that the breeder or beginner can do better to attend and we trust that the readers of this paper will be there to support it. In case any of our readers find that they can not attend their bids will be handled fairly and honorably by the representative of this paper, R. P. Royce.

Hall & Rapp's Poland Chinas

Hall & Rapp, Rocheport, Mo., are offering a desirable lot of spring boars sired by Smooth Columbus and Spotted Monster. Bred. gilts are also for sale. It will pay any of our readers to get this firms prices before buying.

Belcher and Bennett Bros.' Smooth Columbus Sale.

Our readers who are interested in Poland Chinas will note with interest the advertisement of Belcher and Bennett Bros., in which they announce that on Saturday, February 19th, they will offer at public sale, at the Bennett farm, six miles from Lee's Summit, Mo., 45 head of bred sows and gilts.

This sale is noteworthy for several reasons. In the first place, the fact that every sow is either sired by or bred to the great boar Smooth Columbus, would be sufficient to attract buyers of the better sorts. A second fact of note is that it was Smooth Columbus that made it possible for John Belcher to hold the record sale of the state last year. And last, but more important, is the outstanding individual excellence of the offering.

Both firms rank at the top as breeders and when Bennett Bros. paid $750 for a half interest in Smooth Columbus it was a foregone conclusion that the two herds would be topped for a winter sale.

The 45 head cataloged consist of 35 tried sows and yearlings and ten extra choice spring gilts. Taken as a whole we doubt if a more attractive lot will be sold in any state. It is difficult to know just where to begin describing the offering but the 7 Smooth Columbus gilts are about all one could ask. Five of the gilts are yearlings and 2 are spring gilts. Indeed, one of the latter was the first prize junior gilt at Sedalia last year. Breeders who saw her will recall her unusual size and extreme quality. She should weigh around 400 pounds by sale day. Mr. Belcher made the remark that he believed these gilts represent the 7 best gilts by one sire he ever saw go in a sale. We have tried to recall seven better ones and we are at a loss to name them. Another real attraction is the great sow Fessy's Lady, a 3 year old daughter of old A Wonder. This sow, No. 1 in the catalog, is not only a splendid individual, but she has proven to be an exceptional producer. She sells bred to Smooth Columbus. Another tried sow is by Pritchett's A Wonder. Two extra good yearlings are by Big Orange. Two daughters of Big Joe, one a yearling, and one a spring gilt, would be attractive in any sale. A yearling by Black Big Bone 2nd, grand champion at Iowa in 1915, is also in the offering. Another attractive number is the gilt my Long Big Bone, who is a litter mate to the Iowa champion. Space does not permit more detailed mention of the offering at this time but we will have more to say in future issues.

That part of the offering sired by Smooth Columbus will be sold bred to the splendid young boar, Master Orphan, by The Big Orphan, and out of Lady Rose 2nd, by Long Wonder, the sire of old A Wonder. Lady Rose 2nd was one of the best producing sows of the breed. This cross is producing an unusual amount of size and quality and for the benefit of the buyers, the owners have arranged to have an ocular demonstration of what it will do, by exhibiting several Smooth Columbus-The Master Orphan gilts. Further, they will have on exhibit a September 5th, litter out of the cheapest sow sold in the 1915 sale, sired by Smooth Columbus, that will weigh over 200 pounds by sale day.

The entire offering is immune and will be presented in the very best possible condition to go on and do the buyer good. Send for catalog now and watch this paper for further notice. When writing kindly mention The Missouri Farmer.

Buyers of Pure-Bred Live Stock

Our readers are reminded that the service of our fieldman is at their disposal in buying pure bred live stock. He will be glad to answer any questions, advise with our readers, or make selctions for them.

Angus Cows and Heifers

In a recent letter from J. M. Jones, Everton, Mo., who advertises Angus cattle and Poland China hog, in this paper, he has the following to say concerning the cattle he now has ready for sale: "We are now offering ten head of cows and heifers that are not only well bred and ready to make money for the man who wants to handle the market topping kind, but we are pricing them well worth the money. We are short of room and as we are getting a bunch of young bulls ready for the spring trade we must move them. We have recently sold six head of bulls to a Wyoming buyer."

Porterfield's Duroc Sow Sale

Our readers are reminded that on February 8th J. A. Porterfield will hold his annual bred sow sale at Jamesport, Mo. The coming sale will feature the get of Top Inventor, one of the real big type Duroc boars owned in Missouri.

Mr. Porterfield's 1916 offering is up to his standard of former years and will afford an excellent opportunity to purchase well bred Durocs of the type most approved by breders and farmers. Fifty head are cataloged to sell and will include about 40 early spring gilts and 10 tried sows. The major portion of the spring gilts are by Top Inventor and will be sold bred to Iowa Cherry Col., a young boar of exceptional promise that has been recently added to the herd. He is by Cherry Col., one of the mot popular sires of the breed. Other boars represented in the offering are King of Cols. II, AuctioneerII and Graceful Lad, by Beauty's Model Top. We have seen this offering and do not hesitate to recommend it to those of our readers who are in the market for good useful Durocs that have made good wherever tried. Send for catalog and mention this paper.

Linhardt's Polands

H. O. Linhardt, Lohman, Mo., is now prepared to send out a very attractive lot of strictly big type Poland China gilts. Mr. Linhardt has one of the good herds of his section. He has spent time and money in building up his herd and the class of hogs he produces meet with ready demand. When writing mention this paper.

Lockridge Postpones His Poland China Bred Sow Sale

Will G. Lockridge, Fayette, Mo., advises us that he has decided to postpone the sale of bred sows and gilts from February 2nd to a later date in February, not yet definitely decided upon.

Watch this paper for his advertisement.

Porter Offers Poland Chinas, Jerseys and Seed Corn

M. D. Porter, Vandalia, Mo., the veteran Poland China breeder, is now advertising a number of extra good gilts that are bred to his splendid young boar, Rock Valley Wonder. These gilts are sired by Smooth Columbus, Black Big Wonder, Longfellow Sampson, Joe Hadley and other prominent boars. The young boar Rock Valley Wonder, is not only a prize winner himself but is counted the best pig that John Miller raised last year. This fact alone should be sufficient to move these gilts, as the mere mention of John Miller is to bring to mind one of

POLAND CHINAS

Smooth Columbus
THE BOAR THAT PUT MISSOURI ON THE MAP. HEADS OUR HERD

J. V. FISH, Route 7 BOLIVAR, MO.

the pioneer advocates of the big type Poland. The Jersey bull referred to in the advertisement is by an imported bull and won second at the Iowa State Fair in 1914 as a junior calf. Mr. Porter advises us that he is pricing all this livestock worth the money and that he guarantees it to please. The seed corn offered is carefully selected from high producing strains. In writing mention this paper.

Thomson Bros. Offer Duroc Bred Gilts

Notice the change in the advertisement of W. H. & Geo. E. Thomson, Columbia, Mo. This well known firm is now offering the readers of this paper some splendid values in bred gilts and yearlings. We have seen this lot and will say that they are right in every way. The spring gilts are sired by Col. Wonder II, counted the best son of the noted Col. Wonder, by Beauty's Col., a son of Beauty's Model Top, the champion and sire of champions, and by I Am Col. Enough, the strongly bred Col. boar that rendered such valuable service in the Thomson herd. The yearling sows are by Columbus and Col. Wonder II. These gilts are decidedly well bred and are well grown. Messrs. Thomson have enjoyed a very satisfactory trade on their Durocs and this present offering is sold on the same liberal guarantee of satisfaction. Write this firm for prices.

Rockwood Durocs

Rockwood Farm, Ieria, Mo., offers an extra good lot of Duroc spring gilts bred for early spring farrow. These gilts are sired by such noted hogs as Col. Wonder, and Instructor. The prices are very reasonable.

Cooke's Holsteins

Harry Cooke, of the firm of S. W. Cooke & Sons, Maysville, Mo., who advertise Holsteins in this paper, was in the office last week while attending Farmers' Week, and informed us that they had an exceptionally attractive lot of bull calves on hand now that were ready for sale. The calves are sired by Prince Segis Walker Petjre, one of the best bred Holstein bulls ever brought to Missouri. This bull comes from a long line of high producing dams and the calves by him are for the most part out of A. R. O. dams. Messrs. Cooke can at all times supply anything our readers may want in cows and heifers.

Williamson's Poland Chinas

Look up the advertisement of H. S. Williamson, Centralia, Mo., and note that he offers Poland China gilts of first-class big type breeding that are bred to farrow in early spring. Mr. Williamson has insisted upon size and bone in his herd, and it is commonly remarked by visitors that this herd shows as much, if not more, bone than any herd in the country. His prices are reasonable and he sells on a guarantee.

HEREFORD CATTLE

HEREFORD BULL

For sale, a registered Hereford bull two years old. A good individual and priced right for a quick sale.

Hugh Whiteford - - Guilford, Mo.

RED POLLED

RED POLLED CATTLE

HERD ESTABLISHED 16 YEARS

Young stock for sale at all times. Young bulls sired by Logan 13500. The dual purpose kind. Also Spotted Poland China spring boars and gilts.

Old Trusty Incubators

Brought Success and Profits To 650,000 Poultry Raisers

H. H. Johnson

READER, if *profits* can interest you I want you to get in touch with us. I want to tell you how and why Old Trusty has brought success and profits to so many thousands of people, and to outline to you the *Johnson Plan* of raising chickens, ducks, turkeys or geese on a *money-making* scale. I want to give you the same plans and ideas that started our customers from coast to coast doubling up their poultry incomes.

Maybe you have never given chickens much thought. Do you know that chickens can return more *actual cash* for the little attention you give them than pork, beef or mutton? On some farms Old Trusty has made the poultry *pay all the bills and more.* A mainstay income so to speak. Profits in other lines are saved—or put into the bank or into improvements or luxuries that were not possible before. Let me tell you of homes where this has worked out. But, whether you go into poultry raising for all there's in it, or just let it bring a few extra dollars now and then, it will pay you to get the Johnson plan.

Write Today for This New 136-Page Book—Full of the Ideas That Started Others Making Poultry Incomes FREE

M. M. Johnson
An Engineer and a Poultry Raiser. Inventor of Old Trusty and Founder of the Largest Incubator Business in the World.

There will be no obligation whatever. The book is free. I just want you to know what we have done in starting others, and what we can do for you too if you want to make more money than you are making now.

There's no experiment about it—no lessons to learn—no big investment made—you do not drop any of your present work—and it's not even necessary to have had previous experience, for *Old Trusty brings all the experience that's needed.* Anyone can operate it—even the most inexperienced have made big hatches with it right from the start. When you think of the fact that this incubator is used by *hundreds of thousands* more people than those who use any other, you must admit that it has made a *big success.* It leaves no doubt as to the *best* incubator. One thing about Old Trusty is that profits are *sure* if you do your part.

It can turn out record-making hatches for you at any time of the year. In coldest January or February as easy as in warm May or June.

Make Winter Hatches for Big Profits

It's the cold weather hatches that give you the big profits in chickens to sell in July and August or laying pullets in the fall and winter months when egg prices are highest. You need Old Trusty for this work. Here and there you may find an incubator that can make cold weather hatches, but remember, you are asked a high price for it. Old Trusty gives you top-notch construction at the bottom price because it's built in the largest exclusive incubator and brooder factory in the world. We make its parts in lots of tens of thousands. We have the most modern labor and cost saving equipment. We have no "big guns" drawing fat salaries and adding to our overhead cost. Therefore we are in a position to give you the biggest value for the least money. That's Old Trusty.

Practically speaking, there's no wear out to Old Trusty. One customer, Mr. S. W. Warren, at Tryon, Neb., bought an Old Trusty of us twelve years ago. A few weeks ago he wrote that it's still giving good service. That gives Old Trusty a pretty low cost per year, don't you think? And figuring that Old Trusty generally pays back its cost with the first hatch, what could be a better investment? But I am not going to urge you to buy an Old Trusty. What I want you to do is to send for our book and then arrange your plans accordingly. In this book we give you the facts on the raising of poultry as we found from actual experience. You'll find no fancy advertising language in it and nothing drawn from the imagination. It's just a home-made book gotten up by ourselves here in our own printing shop in Clay Center, but it's crammed full of sane *money-making* ideas from cover to cover.

Send for it today then you're in line for another income. Write your name on a postal or send a letter, as you prefer. But mail it today. Yours truly,
H. H. JOHNSON

The M. M. Johnson Co., Clay Center, Neb.

Less than $10 still buys OLD TRUSTY Shipped freight paid to anywhere east of the Rockies — a trifle more to points farther west. Quick shipment from factory at Clay Center or warehouses at St. Joseph, Mo., or Seattle, Wash.

Abraham Lincoln

A few days ago marked the birthday of Abraham Lincoln and from one end of our mighty land to the other all thinking men paid silent tribute to this great character who impresses himself more and more upon the ideals of the great Republic for which he lived and died. The past history of our Nation is rich with men whose names have been written in imperishable letters upon the scroll of time. There is the sainted Washington who looms majestic through the mists that reach back to Valley Forge and to the Brandywine. There is Jefferson whose philosophy of human liberty will be read and invoked as long as the phrase means anything and as long as society continues to strive toward equality of opportunity—while closely following after are the names of Benjamin Franklin, Patrick Henry, Alexander Hamilton and others whose courage, manhood and patriotism will ever remain a sacred heritage to those who today enjoy the blessings and the privileges for which these titans fought and toiled in the long ago—for truly in all the toilsome struggles of civilization no other set of men ever wrought as splendidly as did these.

And yet, great as all these men were, Lincoln was something more—something which has caused the millions to pause with profound awe, not only at the master statesman but to love the man himself as perhaps no other man has ever been loved in the World's history—to pay tribute to that beautiful quality of simplicity and deep humanity which marked his every act and which is so often missing in the makeup of those who succeed in scaling the dizzy and perilous heights of immortality.

Truly, the life and history of this remarkable man constitutes a romance and a heritage of inestimable value to the idealism of the Nation. Emerging from a little log cabin hidden away among the wildwood of the Kentucky hills he fought his way step by step until finally he found himself the chief actor in one of the most tragic dramas the World has ever known. With no education save that which he laboriously acquired by the light of a candle after his arduous day's work was done, he emerged a polished thinker before whom the philosophers and learned men of all time may well bow in reverent awe. Unschooled and untutored in statecraft, he stepped from his law office at Springfield into the seething whirlpool of politics at the National capitol—and although there were those who came into his councils to scoff, in the end they remained to pray—content to meekly follow this man of whom the gruff old Stanton said, as he looked into his dead face, "There lies the greatest leader of men the World has ever known." Brave as a lion he was yet as gentle as a woman. Always ready to listen to the advice of others—and always deliberately seeking it—he was nevertheless in the end as firm as the everlasting hills—altogether the rarest mixture of might and tenderness, of profound understanding and human simplicity the realm of statesmanship has ever produced.

Is it any wonder that as the years pass on his figure should loom larger and larger in the retrospect and that the ideals for which he toiled should more and more become a guiding star for those who labor honestly and conscientiously in our halls of state? Does not the life of Lincoln typify more than that of any other man the best there is in Democracy? Has any other man ever so splendidly interpreted the true meaning of human right? Was not his every act and smile and jest a rebuke to arrogance and snobbery? Is not the rock bestrewn, briar and bramble bordered path which reached from the little log cabin in the backwoods of Kentucky to the White House a marvelous inspiration to every American boy—it matters not how humble and lowly his circumstances at this hour? It is in this latter sense that I wish to especially commend the life and acts of this great man to the young farmer boys who may chance to read these lines. If you have never read the history of Abraham Lincoln do so at your earliest opportunity—for you cannot follow his career without desiring to give the best possible account of your stewardship in the years to come.

—By the Author of After Thoughts.

OUTSIDE, LOOKING IN

A great many Missouri farmers have been and are being benefited by the work of our Agricultural College and State Board of Agriculture. It is, however, the progressive farmers as a rule (the men best able to help themselves) that are being reached and helped. Of course these men are spreading the gospel of better farming throughout their respective communities and slowly overcoming the conservative opposition to progressive ideas. But it seems that some more direct and special effort should be made to reach the man on the outside looking in (and too often doesn't care to come in).

Why are so many of our farmers suspicious of our college and state board workers? One reason is because much of their work overshoots the mark (the average farmer). Too many of their ideas and suggestions apply only to the man in comfortable financial circumstances who needs only to be convinced in order that he may put them into practice. Too often the condition of the small land owner or renter is not reached (overshot) and to them these ideas are not practical. They feel that they are on the outside. That the information is not for them. Even if interested they can not see their way to try out the suggestions. Some naturally shy at the college men.

How to reach these non-progressives (who after all make up a very large per cent of the sum total of country life) is our problem.

I would suggest that one way of reaching this class of men is through a farm visitor. A practical farmer stockman, visiting farms in different parts of the state (and with especial attention given to the renters) studying conditions as they really are on the farm, would be in position to get down to bed rock conditions and difficulties. Where ever he found helpful practical working ideas he could pass them on to others through the press, lectures, bulletins, etc.

The field for usefulness is unlimited. I might mention as a field of endeavor, better schools, roads, churches, etc Co-operative feeding plans between landlord and renter and long term leases.

Always keeping in mind the common people who as Lincoln said, God must have loved for He made so many of them. Such a farm visitor I believe would be able to reach and benefit many farmers in our state, who are not now being reached by our workers. J. H. Smoot, Thompson, Mo.

Editorial Comment: Mr. Smoot raises a very important question and one the College of Agriculture and the State Board of Agriculture ought to seriously study. Much of the work done by the professional agriculturists "overshoots the mark" and these men are at a loss to know why they do? Conditions on the farm where men must sometimes work with little capital, or may be without capital at all, are quite different from the ideal conditions or at least what we might call the artificial conditions under which the college man is working.

Another point we think well taken by Mr. Smoot is the professional agriculturist is too fond of rubbing up against the successful man and is seemingly afraid of the poor man, or of the man who has failed. You know the Savior said it was not the well but the sick who needed a physician and we think this applies to this farm betterment proposition. It is, or ought to be, as much the duty of professional agriculturists to take the man whose agricultural practice is wrong, in other words, the man who has in some respect failed, and put him right, put him on the road to success as it is to try to help the already successful man. Talk to a professional agricultural worker and in nine times out of ten he will tell you what he has learned about some man's success and not once in ten can he tell you where he has helped the man up who was down and started him on the road to a more profitable farm practice. I am not objecting to the college man helping the man who asks it or needs it no matter how well-to-do he may be, but I think the whole attitude of professional agriculture ought to be changed so that the first duty will be towards the man who has failed to make good, but who is ready to try a better way if he is shown how. About a farm visitor that is a pretty big proposition because a man to be of any real service would have to spend considerable time on each farm. We may come to this some day but as we have from 2500 to 3500 farmers in a county you can readily see what a big proposition it is About all we can hope for along this line is to help farmers by clubs or groups with some individual help.

The Missouri Farmer is fighting for a "square deal" for you and your children. It is trying to help you pay off that mortgage—and all we ask in return is that you send us a dollar so we can mark you up for three years. If you do this promptly we will cancel all past subscription.

You Get a-SQUARE DEAL

When You Buy SQUARE DEAL FENCE

[44]

Be square with yourself when you buy fencing. You can't afford to put up a short-lived fence. You can't afford to make the mistake of buying any wire fence on "price" alone. Look out for light, imperfect, brittle wire; thin uneven galvanizing; weak, flimsy, half-tied knots, and out-of-date, clumsily woven, hard-to-put-up fencing. Buy the fence you KNOW you can depend on—one that will stand up tight and trim the whole year 'round—one that will give and take with sudden strains and season's changes—one that will last more years, cost less for repairs, require fewer fence posts, turn all kinds of stock better, hold its shape and resist rust longest—in short, give you most for your money in real fence service and satisfaction. See

SQUARE DEAL FENCE

before you buy. See the famous SQUARE DEAL LOCK—the double grip that will not slip. See the one-piece stay wires, the wavy, springy, strand wires, the perfect weaving, the heavy even galvanizing, the strong, flexible quality of square deal wire made in our own mills, not bought in the open market.

FREE To Landowners Only—If you want a SQUARE DEAL in farm fencing write our factory direct. We will send land owners FREE and postpaid our latest catalog; also a full-size copy (50c edition) of Ropp's New Calculator (if you have not already sent for one before)—160 pages of the greatest money- time- and labor-saving ideas ever published. All FREE. Write today.

The Missouri Farmer

VOLUME VIII | FEBRUARY 15, 1916 | NUMBER 4

The German Agricultural System

By William Hirth, Publisher

It is conceded upon every hand by en who have studied the question at the German system of Agricul- ire is better organized than is that any other nation—and to this is due no small degree the remarkable ility with which the Kaiser has et a shock of war which is shaking e World to its very foundations and hich, regardless of where one's per- nal sympathies may lie as to the erits of the conflict, is admired upon l hands.

How German Farmers Control Their Markets

For years the German farmers have een organized not only behind the Landschaften" system of Agricul- ral credits but long ago they took in and the marketing of their farm pro- ucts with the result that such mo- opolies as has existed in the United tates and which are levying a tribute at grows heavier and heavier each ear are impossible under the German ystem. In other words, the German armer saw to it years ago that he hould have the cheapest and longest me money that the money markets fforded and also that he should re- eive such a price for his crops and ive stock as an honest law of supply nd demand warranted—and hence erman Agriculture has flourished as as that of few other countries in the Vorld. The ground work of this sys- em rests upon an Agricultural soci- ty in the smallest political subdivis- ons corresponding to our township. rom the township it reaches up to he county and from the county up to he state and from the several states nto a great National farm organiza- ion which is presided over by a oard of 72 directors—and these men ot only in a general way direct the ourse of German Agriculture but no neasure is ever passed through the erman Reichstag (which corresponds to the American Congress) until it as received the approval of this owerful board which absolutely dom- nates the Agricultural destiny of the Empire. When a new tariff bill is nder discussion at Washington the nanufacturing interests are there in orce with an array of powerful law- ers and experts and the same is true where Organized Labor is concerned —but there is no organization which represents American Agriculture— which is empowered to speak authori- tatively and intelligently for the in- terests of the American farmer and hence it should cause little wonder that he gets the "hot end" of it in the passage of new tariff bills or other legislation vitally affecting his inter- ests.

Farmers Have the Power—Will They Use It?

Suppose the farmers of every great Agricultural state in the Union were represented by a standing committee of 30 high class farmers who had been carefully selected from the mass of the farmers of each state—and then suppose that these men could delegate such voice and power to a National Committee of 50 or 60 farmers representing all the states—don't you suppose these men would be listened to at the National capital as no set of men were ever listened to before?—and don't you think their every just demand would meet with an instantaneous response?

Suppose that the marketing of the farmers' grain and live stock could be taken in hand next week by powerful committees of this kind representing the farmers of Missouri, Illinois, Indiana, Iowa, Nebraska, Kansas and Oklahoma—don't you think they would soon be able to whip a program into shape which "would get somewhere" and in which the farmers of these states would have a degree of confidence necessary to success? Can't any thinking farmer see that farmers have the resources and power to rescue themselves from the pitiable plight which exists upon every hand today if they will only wake up and act together? Can there be a finer demonstration of what intelligent co-operation will do than is found in the German system? The reader will be able to judge how harmoniously this system works from the fact that in the autumn of 1914 every German farmer from the biggest to the smallest received a communication which told him how many acres of rye, wheat, potatoes, etc., to sow or plant to the end that there might be no underproduction or overproduction in any particular food stuff—thereby guaranteeing a stable price to the farmer and also stretching the resources of German Agriculture to the utmost and enabling the German people and her armies to live at a time when the great Armada of England has closed to her every port in the World. Whether we personally admire the Kaiser or not or whatever we may think of his fault or credit in the great red drama which is now in progress, we cannot help but applaud the splendid efficiency of German Agriculture in an emergency which is without precedent in history and which has meant prosperity to the German farmer for many years.

Missouri Farmers' Association

During the recent Farmers' Week in January a Farmers' Market Conference was held and attended in Columbia by hundreds of farmers from all over the state—and very shortly an Executive Committee will be announced and these men will constitute the future leaders of this great movement in Missouri but what they will be able to accomplish will of course depend upon the interest manifested by the great body of farmers throughout the state.

The temporary chairman is E. H. Bullock of Edina, while J. Kelly Wright of the State Board of Agriculture is Secretary. In a recent issue we published the appeal which was addressed to the farmers of Missouri by the above conference and our readers are therefore familiar with it—and it is to be most sincerely hoped that this temporary organization will soon be built into a great statewide force of farmers reaching into every county in the state.

I hope that the continued insistence of The Missouri Farmer on this score will not become tiresome to our readers—and we are doing it only because in the humble judgment of both the Managing Editor and myself we believe this to be the only remedy for existing conditions which are fast paralyzing American Agriculture and subjecting it to a decay which it cannot stand much longer—not only menacing the well-being of every individual farmer but gravely threatening the future economic stability of the Nation itself.

If the manufacturers, merchants or organized labor were confronted by such conditions as confront the farmer today, powerful and Nation-wide action would be set in motion within 30 days. Are we to be driven to confess that the farmer is inherently weaker and less able mentally to protect his just interests than these other classes? I am sure that such a suggestion would meet with the prompt indignation of thousands of stalwart Missouri farmers who read this paper —and yet, so long as we keep on dreaming and idly drifting with the current, does it not amount to the same thing? When men have the power to protect themselves but don't exercise it, are they not practically in the same boat with the fellow who can't?

In response to our appeals hundreds of farm clubs have been formed—and yet we have hardly scratched the surface—but if the farmers of every school district will arouse themselves, in a little while the movement will gather the force and enthusiasm necessary to success.

"The Farmers' Market Club"

In our last issue we made an appeal for a "thousand fighting farmers" who would help organize a club of at least a dozen "Farmers' Market Club" members in every school district or neighborhood—thus enabling us to supply wholesale prices on carload shipments of bran, shipstuff, oats, hay, corn, fertilizer, and other similar commodities and I want to once more appeal to YOU to be one of these thousand men who will help put this plan into effect. What we can do for the farmers of the state in this matter depends upon the number of clubs which are organized —for our expense and trouble will be almost as heavy on extending this co-operation to 100 as 1000 such clubs. This, therefore, is a final appeal for every true friend of The Missouri Farmer to demonstrate his sincerity for this great movement by "doing something" in his neighborhood. Then, with the inspiration which we will receive from hundreds of these little "Market Clubs" we will be in position, when the rush of spring work is over, to rally around the men who will lead the Farm Association fight in Missouri —and by calling big county mass meetings of farmers, after the rush of harvest is over, will soon have the movement on such a stable basis that the farmers of this state will be able to present a solid front and speak with one voice to those who are today levying an impossible tribute upon the fruit of their sweat and toil. For further information write to us at once. The time is growing short for spring will soon be here.

In the plan of farm organization and better marketing urged by The Missouri Farmer and which has so far been endorsed by thousands of farmers throughout the state, the foundation rests upon the home club. Farmers must first learn to co-operate in the small affairs which affect the business of the community before they can hope to control those greater problems of marketing which are now in the hands of great business corporations backed by millions of capital.

This year, and every year, there will be thousands of dollars worth of field seeds—seed corn, oats, clover seed, timothy seed, cowpeas and soybeans—sold off the farms of Missouri and sold back to other farmers at big profit. Farmers should not complain of middle men so long as they remain content and do nothing to remove the cause for middle men.

It is often the case that a farmer will sell seeds, live stock or other products on the market when at the same time his neighbors are needing the same articles but for lack of any system of exchange they do not know where these things are to be had without going on the market to find them.

The remedy for all this loss in our system of marketing is through the organization of Farmers' Market Clubs—the small neighborhood club first through which the members can learn what articles are to be had at home, and second, by co-operative buying of such articles as feed, flour, coal, binding twin, etc., in large quantities the middle man's profit may be saved. The business may then be extended to the county and state, but the first step is in organization of the local club.

WHY NOT GROW MORE CLOVER?

According to the best information we can get there is but one farmer growing clover to ten who are not growing it. This statement refers to growing clover alone. But if we count every man who grows clover with timothy we have only one out of four and again if we count only those who grow clover for seed we find only one out of forty-six. Surely to men who realize the value of clover as feed, pasturage or for soil improvement this is a sorry showing. Instead of clover showing an increase in acreage from decade to decade as it should do it is on the decline. Is this because clover is not profitable or is it because the farmers do not understand how to grow it? We think perhaps both causes are to be found and must be removed before we can expect an increase in the acreage of clover in Missouri, and this state is not materially different from the surrounding states.

The first handicap in growing clover is in getting a stand. During the dry years recently encountered hundreds of farmers tried seeding clover and failing to get a stand they then became discouraged and they have either gone back to straight timothy or have depended on the annual legumes, cowpeas and soybeans.

There are three different seasons when clover may be seeded with a reasonable degree of success if other conditions are all right. Clover may be sown in the summer on well prepared land either alone or with a crop of wheat or rye. The seeding must be done the last of July or during August in this latitude to give it time to get hardy enough to go through the winter. In exceptional seasons it might do to sow a little later but there is too much risk in doing so. The ground should be plowed early in July then worked into a fine and compacted seed bed and the seed sown and covered with a light harrow or sown with a drill. If rye or wheat is sown with this summer seeding the crop may be pastured when the ground is not wet and the next spring the crop should be cut for hay when the wheat or rye is in bloom.

Another date for seeding is February or early March. If seeded at this time it is best to sow on a nurse crop of wheat or rye for without the nurse crop the summer grasses will be hard to keep down and will probably smother the young plants before the middle of summer. However, where the land is fertile and clean of weeds and grasses the clover may be sown at this time without a nurse crop and at least one crop of hay taken off during the summer. The seed should be sown on frozen ground then the freezing and thawing will cover the seed and if it is well covered it may not germinate until the danger of frost is over. The great danger in February and early March seeding is that a warm spell after sowing will sprout the seed and then a freeze will kill the tender plants and all is lost. Were I practicing this method I should sow before the 20th of February because this early sowing will allow the seed to become covered deep enough that it is not so apt to grow in a few warm days and not so liable to be killed but there is considerable risk in the climate of Missouri in sowing at this time and do the best you can you will occasionally lose a seeding. If, however, it escapes the freeze it will get a good start and have root enough to endure the summer drouth.

The third season for sowing clover and by many farmers considered the safest, is after the danger of freezing is past, say usually in Central Missouri, the first week in April. I know a great many farmers who have adopted this time and the writer has practiced seeding the first week in April for more than twenty-five years with good success. If seeding on wheat we would cover with a harrow, unless seeding with a drill, to get the seed well covered. This working will do the wheat no harm unless possibly it is badly "heaved" by winter freezing and in that instance a good rolling might be better, but in this connection we might say that red clover is not a very safe crop on land that "heaves" very badly. Remember this, that where clover is seeded with a nurse crop the earlier that crop is taken off the better chance the clover will have and for that reason if the nurse crop is oats or rye we would never fail to cut these crops early for hay and even with wheat if the hay is needed on the farm it will be better four years out of five to cut it off before the wheat is ripe enough to thrash for grain. We have seen a great many good stands of clover killed after the grain was cut. This is more apt to be so if the weather is very dry about harvest time.

A good practice, but one not in general use for some reason, is to clip the clover two to four weeks after the nurse crop is cut off. This clipping has several advantages. It will hold back the weeds that are starting; it will give a mulch for the young clover by clipping about half the height of stubble and the weeds and this will be a decided help to the young plants if it is very dry; it gives a more stocky plant and sometimes a very thin looking stand, after clipping will thicken up and be all right.

Amount of Seed to Sow

There is a wide difference among farmers in the amount of seed sown on an acre. Where clover is sown alone the practice is to sow from 6 to 10 pounds per acre. That is a bushel of seed is sown on from 6 to 8 acres of land. On land that is not sour and which is in a good state of fertility and cultivation we consider the thinner seeding ample but where the soil is hard and poor from long time cropping and without manure or the turning under of green crops it will be safer to sow the greater amount. At present prices a difference of 4 pounds per acre makes a difference of about 80 cents an acre in the cost of clover seed and we wonder why it is farmers can not see that if that 80 cents were put into soil betterment they would get it back in bigger crops but if it is put in a larger quantity of seed it might be said to be entirely lost. Where clover is seeded with timothy a great many farmers sow the same amount of seed as where it is sown alone for they count on a full crop of clover the first year harvested, but where the timothy is seeded in the fall and promises a crop the first year one-half the amount of clover seed will be sufficient.

The two leading varieties of clover are the common red and the mammoth or sapling clover. The common red is the one more generally sown in Missouri. For seeding alone for hay and for seed crops we would prefer the common red, but for seeding with timothy or for pasturing we would take the mamomth. The mammoth is coarser, grows taller, is later maturing and seems to do better on poor land than the common red. Being later it ripens more nearly with timothy and will make a good quality of hay if cut in good time—when about one-fourth the heads are brown. For turning under for soil improvement the mammoth is considered best on account of its ranker growth. If those farmers who have been raising straight timothy will just try a timothy-clover mixture on a part of the field once and note the difference in the amount of hay and pasture they will be forever convinced of the value of clover. The mixture makes a better quality of hay, makes more hay per acre and the crop is much better for the land than where timothy alone is grown. The writer first had this called to his attention about thirty years ago when seeding down an old field. The land was carefully prepared and seeded to timothy with a nurse crop of flax and on a part of the field five pounds of clover seed was sown to the acre. The next year when the hay was cut the timothy with the clover, without any other difference of treatment, was on the average two inches taller than where timothy alone was grown and when the hay was raked into windrows there were four rows of hay on the clover side to three on the timothy side, and the difference was equally apparent the next year when the field was pastured with cattle. A pretty big profit on that much seed cost.

Alsike Clover for Wet Land

There is much flat and undrained prairie too wet for successful growing until it is drained and there is plenty of land in Missouri where clover has failed on account of too much acidity. The two things that will sweeten the soil are drainage and lime. However, before these are corrected it may be profitable to try growing alsike clover. This variety has a pink blossom, is apparently a cross between the common white clover and the red, has a more recumbent or vine-like stalk, grows very fine in stalk but does not make as much hay as the other varieties and does not make much second crop. But for pastures or for mixing with timothy on wet-like land it will pay to try. The seed looks very much like white clover seed and as the size is much smaller than red clover less than half the amount may be sown. Alsike is one of the finest honey producers we have.

Were we asked for the two principal causes of failure with clover aside from the slovenly methods of some farmers in seeding the crop we would say it was need of lime in the soil and need of humus or vegetable matter or in other words a lack of physical condition. An easy way and sure way to find out if the soil needs lime is to make a trial. This will cost but little then you will know and in no other way can you be very certain about it. It will cost very little to buy a ton of ground limestone or a barrel or two of air-slacked lime and that will tell the tale. Use a barrel of air-slacked lime on a plot 2x8 rods or say one-tenth of an acre. If ground limestone is used a ton should be put on half an acre. This will be enough to tell the lime story and will cost very little. It is best to put the lime on the wheat ground after it is plowed in the summer and the working the land will mix the lime with the soil. We would not apply lime to wheat land in the spring but where clover is sown with oats we would make a trial by spreading the lime on the oats ground and disking it in before sowing the clover. In our next article we will discuss the value of clover as a green manure crop and the need of humus in getting a stand and its value as a seed crop.

SCARED BEFORE HE IS HURT

ditor Missouri Farmer:

I have just received a Gardner Land ank petition accompanied with argu- ıents and much favorable comment ut I am not convinced. The amorti- ıtion plan is perfect, the rate of in- ›rest reasonable (it ought to be 3%) nd the long time payments all that ›uld be desired, forming a set of rinciples good enough to blind a lot f mighty good men to some things ot so good.

In the first place the whole thing is ›ecial class legislation which is either desirable nor necessary be- ıuse any business that can not stand n its own merits ought to perish. esides if it is established it will be sed as a gag on the farmers while ther interests steal the whole coun- ·y, farmer and all. Every proposition r measure has behind it some one ho is interested and I am sure there not a debt ridden farmer in all that nposing list of forty-nine state com- ıittee, and not more than half a dozen eal farmers. I do not question these ıen's motives, but it is contrary to ıe social and economic order of ıings for one class to lift another lass out of the mire, unless it is to et more out of them.

Now, let's see if we can find an in- entive. In Section VII we read as ›llows: "The state shall be divided ıto appraisement districts and the ıanager shall appoint, subject to the pproval of the board of governors, xpert appraisers in their districts. 'he salary of the appraisers shall be wo thousand ($2000.00) dollars and xpenses." There you have one in- entive. Why was this made $2,000 hen just as good service could have een secured for $900. Two thousand ollars is not too much for a man to eceive, but under present conditions t looks mighty big to a lot of farmers n Missouri who work all their lives or their board and clothes and don't ıave much of either. Again, how nany appraisers will it take? Frank- in County has 866 sections with from ›ne to six mortgages (death grips) to he section. With extreme distances ›ver forty miles, I don't see how a man could be an "Expert Appraiser" and tend to more than one county and probably that would be the rate. These appraisers are appointed by the Governor. One hundred and fourteen men with a salary of $2000.00 and an unlimited expense account all parti- sans of the Governor, will form one of the best partisan machines in the state. So. Mr. Farmer, desiring to se- cure a loan must be careful about being an offensive partisan and he may need to be careful what kind of religion he has because section seven lines eight, nine, ten and eleven reads: "He shall appraise the land at its cash value and make his report thereon under oath, without delay, giving al- in said report such information as he may have concerning the applicant and the land as to the desirability of the loan." The applicant must furnish an abstract of title which will cost him from $10 to $50 which directly or indirectly may compensate the prose- cuting attorney for a very large amount of examining and reporting for nothing.

Now, this measure may go through, not because thousands on top of thousands of worthy and industrious Missouri farmers sorely need a lower rate of interest with the amortization principle, but because scheming poli- ticians want more high salaried offices and the bankers and bondholders want more untaxed bonds and control most of the presses of the state.

F. W. Evins, Lonedell, Mo.

Editorial Comment: There are a number of contradictory statements or arguments in the above article that we can not harmonize after a careful reading, but we will attempt to show the error in our correspondent's rea- soning irrespective of these contradic- tions. In the first place the whole tone of Mr. Evins' article is to show that the farmer needs a lower rate of interest, longer time, etc., but he turns about and calls it all class legislation. If this law can be truthfully called class legislation then many of our laws long recognized as for the gen- eral good may be attacked on the same ground. Our banking laws enacted for the operation and regulation of banks might be called class legislation yet they were enacted and are en- forced for the general good. The same may be said of our transportation laws and many others we might mention. If a rural credit law will help any one it must help the man who culti- vates the soil—that is the aim of such a law in every country where it has been tried, and so far as we can find out it has done that very thing in every country operating under a gov- ernment controlled rural credit sys- tem. You may say the German farm- ers, the Irish farmers the French farmers and the farmers of all the other countries where rural credit legislation has been tried have been the beneficiaries of "class legislation," but what of it, if at the same time the whole country has been benefited by saving it from the direful effects of "Landlordism"? The man who shuts his eyes to history and follows only his blind prejudices may not see these things but they are there for his ben- efit if he will just look at them with an open and unprejudiced mind.

We think it is a wrong view to say the merchant, the banker or the law- yer should have nothing to say in the adoption of a rural credit system. Do not we farmers take a position and express our opinions on laws govern- ing other classes? Then why object to others exercising the same right when a law is proposed affecting us farmers? If the general prosperity and future stability of our country de- pend upon a proper distribution of the land then why deny any one the right to exercise his right of passing on the question?

Mr. Evins crosses several bridges before he gets to them by supposing impractical things that he is afraid will happen under the Gardner Land Bank Bill if it becomes a law. No political machine is going to be built up under this law. Who pays the ex- penses of these appraisers Mr. Evins is so much afraid of? The state? No, the expense is paid for by the bor- rower, and if Mr. Governor would try to build a machine by putting on 114 appraisers when only 5 or 10 were needed what would happen? Would not a protest go up from the several thousand borrowers who were paying the bills? When this law goes into effect there will be no stampede of borrowers to get into the Land Bank. But there will be only enough ap- praisers employed to handle the busi- ness and it matters not whether it takes one or a hundred, so they are efficiently employed. Does not the borrower pay the expense of appraise- ment under the present system? Cer- tainly he does. One of the big insur- ance companies which has approxi- mately $20,000,000 loaned in Missouri employs one appraiser and pays him a salary of $6000 a year. As this com- pany makes loans for 5 to 10 years their annual placement of new loans and renwals is more than $2,000,000 yet they get along with one man, but they don't think of getting him for $900 a year. It is preposterous to talk about getting a competent land ap- praiser for that salary. We are com- pelled to pay our stenographer more salary than that!

Just get it into your mind that all these expenses of appraisement, exam- ining titles, acknowledgements and everything else must be paid for by the borrower now and in the Gardner Land Bank plan we are finding a way to cut down these charges and make it easier on the borrower. Will you tell us what harm there is in that? The sole aim of this plan is to give the borrower lower interest and less expenses in getting a loan, but what- ever that expense is he must pay it— the state does not offer to do it for him.

Cowpeas and Soybeans Wanted

Three Hundred Million Bushel Crop in 1915

Farmers pay for their land with one year's crop and prosperity was never so great.

Regarding Western Canada as a grain producer, a prominent business man says: "Canada's position today is sounder than ever. There is more wheat, more oats, more grain for feed, 20% more cattle than last year and more hogs. The war market in Europe needs our surplus. As for the wheat crop, it is marvelous and a monument of strength for business confidence to build upon, exceeding the most optimistic predictions."

Wheat averaged in 1915 over 25 bushels per acre
Oats averaged in 1915 over 45 bushels per acre
Barley averaged in 1915 over 40 bushels per acre

Prices are high, markets convenient, excellent land low in price either improved or otherwise, ranging from $12 to $30 per acre. Free homestead lands are plentiful and not far from railway lines and convenient to good schools and churches. The climate is healthful. **There is no war tax on land, nor is there any conscription.** For complete information as to best locations for settlement, reduced railroad rates and descriptive illustrated pamphlet, address

Six Reasons for Avery Tractor Success

THERE are more acres plowed by Avery Tractors and Plows than by any other make. These are some of the reasons why so many men are buying Avery Outfits:

First—Special sliding frame which makes possible the elimination of the intermediate gear, shaft and boxings. An Avery Tractor has the least gears, the least shafting and the least bearings of any two-speed, double-drive tractors built — which means more power and longer life.
Second—Two rear drive wheels and two speeds —a big advantage over single-drive and one-speed tractors.
Third—Slow-speed, heavy-duty opposed motors —not high-speed, light automobile motors.
Fourth—Crankshafts are one-half the diameter of the cylinder or more. There has never been a broken Avery crankshaft.
Fifth—Motors have renewable inner cylinder walls. These parts, which are subject to the most wear, can be replaced without buying entire new cylinders.
Sixth—No pumps and fans.

Complete Outfit—Tractor, Plow and Thresher—Built and Backed by One Company
A company with a large factory and many branch houses, which insure prompt and permanent service. Avery Plows in all sizes from 3 to 10 bottom. "Yellow-Fellow" Separators in sizes to fit each size tractor.

Prices—3-plow Tractor, $760 cash; 4-plow, $1120 cash; 5-plow, $1680; 6-plow, $2145; 8-10-plow, $2475. Special small size tractor, $295.

A NATIONAL SYSTEM OF AGRICULTURAL EDUCATION

By H. J. Waters, President Kansas State Agricultural College.

[Copy of an address delivered before the recent Pan-American Scientific Congress, Washington, D. C. President Waters has a National reputation for being one of the ablest thinkers in this country and we are sure this address will be read with great interest and profit by our readers.—Editor The Missouri Farmer.]

(Continued from last issue)

City and Country Progress Together

The city children ought to understand that though the farmer has undertaken the most important task of any man, that of providing the world with its food, clothing, and the raw material for its industries, he never has had and probably never will have much to say regarding the conditions under which he will discharge that task and these children should understand that the way in which society determines these conditions will in turn determine the standing and progress of both city and country. City children should appreciate the limitations of farm production and realize that conditions which they impose that are not to the best interests of the country will not in the end be for their own best interests. They should early learn that no civilization has withstood the effect of the decay of its rural people.

Occasionally a nation may be so situated as to support itself with commercial and transportation enterprises alone, but the exceptions will always be few to the law that a people which forgets agriculture cannot long survive.

Agriculture in Every Course of Study

No system of agricultural education, therefore, can be broad enough to meet the needs of a modern civilization that does not recognize the principle that interest in agriculture is not limited to those who till the soil, but ought to be universal.

It must embrace research as well as instruction. It must reach as high in our colleges and universities as does any other kind of education, for how else may the dignity of agriculture be maintained? And it should extend as low as is required to meet the needs of the children of the grades and of the humblest farmer of the land. It must be national in its scope.

It is a narrow view which limits the scope of agricultural education to the field covered by the agricultural colleges of the country.

Only a small part of the people of any country ever attend institutions of college grade, and in the nature of the case only a part of these will study agriculture. Therefore, all the agricultural colleges which any country will find it profitable to support when working ever so diligently and efficiently, will not be able to train more than the leaders in agriculture.

The facilities of the high schools of the country must be employed and the United States at least needs more high schools, especially rural high schools. A good high school should be within easy reach of every boy and girl in the land.

But the problem is by no means solved when agriculture is successfully taught in all the high schools of a country, for comparatively few of those who are to farm will attend a high school. Indeed, from seventy-five to ninety per cent of the boys and girls of the United States leave school and enter life occupations before they are sixteen years of age and before they reach the high school.

Perhaps nine-tenths of our farmers have gone directly to their work from the rural school. To reach them with instruction that will make them better citizens and more successful husbandmen and business men, means that we must teach agriculture in this school.

Early Agricultural Instruction a Failure

Although agriculture was man's first organized occupation and has been his chief occupation in every age since, it has been the last subject to be introduced into the course of study of our schools.

The early attempts at teaching this subject in America were failures principally because the man on the farm knew more about farming than did the teacher. This quickly led to the establishment of agricultural experiment stations, research institutions in which the application of science to agriculture was studied, where the reasons for the most successful farm practices were discovered, and where new and improved practices were devised. Thus, for the first time in the history of education, a deliberate attempt was made, through a well coordinated system of scientific research, to create a body of knowledge in relation to a subject which it was deemed important to teach, but about which so little of a definite nature was known that it could not be taught successfully.

It is true that scientific research has been a part of the activity of most institutions of higher learning for a long time, but there had not been before an organized, co-ordinated, and compulsory system of research as a definite part of a great educational program.

Agricultural Research a Stimulus to Other Study

The success of the investigations in agriculture in this country has been a wonderful stimulus to the research activity in other lines. As might have been expected, the first result of this suddenly stimulated activity in research was the accumulation of knowledge more rapidly than it could be absorbed by the farmers and adapted into their practices. A way had to be devised by which to get the man on the soil, who is largely muscle-minded and eye-minded, to adopt these new methods. As a result, a system of extension teaching through farmers' institutes, press articles, and farm demonstrations, grew up. It is only within very recent years, indeed, since the passage of an Act of Congress, by which the Federal Government joined with the states through the agricultural colleges, that the effort to carry this knowledge to the people has become general and effective.

The School Trained Farmer a Success

Thus, new as is the system of agricultural instruction, and halting as was its progress in the beginning, it has already marked two distinct and important departures from educational traditions—one in the organized system of research through which a body of knowledge pertaining to the subject was created; the other in an organized system of extension or continuation teaching through which parents as well as pupils were reached with this new-found knowledge. Both of these departures have already exerted a large influence upon general educational thought and practice.

Agriculture is now successfully taught because there is something to teach and because teachers have been trained to teach it. Young men are as well prepared at college to engage in the practice of farming as they are at college to engage in the practice of

New Victor
Combined Cultivators

Recommended for use anywhere. Has balancing lever and two depth levers; has handles and seat, and can be used as a walker or rider. Pivot Tongue Attachment furnished when wanted.

It's the Way We Build Them

Axles telescope in steel tube, giving adjustment for wide or narrow track. Saw-toothed ratchets give minute depth adjustment, and afford quick action in raising gangs. Counter-balancing springs on gangs can be regulated for light or heavy gangs. Jointed seat rails; seat can be thrown over out of the way when walking. Low hitch with high clearance. Cone pivot gang couplings permit taking up all wear. Gangs can be set up or down to level for different depths. Gangs can be set for close or wide cultivation. 42-inch wheels with concave tires, removable dust-proof wheel boxings, hard oil screw caps, with collar and linch pins inside the screw caps. Furnished with any standard type of P & O gangs, with spreader.

The P & O Victor is strong without excessive weight, has all needed adjustments, is easy to ride and use, will do work of the highest efficiency, and has great wearing qualities.

law, or medicine, or journalism; and the farmer has as much respect for the the college trained farmer as he has for the college trained lawyer or doctor.

There is no reason why agriculture may not now become the most interesting, the most inspiring and the most educative subject in the school course—which means that it may be the most successfully taught subject in the school.

WILL YOU GROW OATS OR SMUT?

"Whatsoever a man soweth that shall he also reap" would not be a bad banner to hang up just over the oats bin and it would be well to have it printed in red or some other attractive color so that it would be read every time the farmer went into his barn.

There is a loss of thousands of dollars, yes, of millions, every year because we sow oats affected with smut. If we sow smutted seed oats we will get smut in proportion to what we sow and perhaps depending some on the character of the season. The amount of smut found in the average oat field will vary anywhere from two per cent up to twenty-five per cent.

If farmers are satisfied to take this loss and reap a crop of from one to ten bushels less per acre than they could get by treating their seed oats before sowing then there is no use of further argument, but I am convinced that farmers do not take this loss of crop because they really want it but I think it is because they think only a scientist or a seed doctor can treat the seed and prevent the loss.

Almost every year for the past six we have given a formula for treating seed oats and urged farmers to use it but have not heard from very many who have done so. Why is this?

Last year representatives of the Indiana Experiment Station planned a number of demonstrations with farmers to test the value of the formaldehyde treatment to prevent smut in oats and in the treated fields the smut at harvest time showed from nothing up to one per cent, an average of only one-half of one per cent while the untreated fields showed from 7 to 21 per cent of smut or an average of 13.8. These trials covered twelve counties and ten or more farms to the county. Is five bushels per acre an item worth while or does that look too small to you to bother with? Well, if your oats have been very badly infested with smut your loss may have been ten or fifteen bushels and surely that is enough to wake up most any farmer who knows the high feeding value of oats.

Now here is the treatment, so simple any man can use it and costing no more for treating enough seed for ten acres than a pound of tobacco or a dozen packages of chewing gum.

"Mix one pint of commercial formalin with 40 or 50 gallons of water in barrels or other convenient vessels. Formalin may be obtained from any drug store. Immerse the oats in this solution, stirring well so that all will be thoroughly soaked. Pour off the solution, dump the oats out and stir occasionally until dry. Another method employed is to sprinkle the oats with the solution until they are well soaked and then heap them up in a pile and cover with blankets or sacks. Leave them in this pile for five or six hours, or even over night, and then spread out to dry. Stir frequently until thoroughly dried, after which they may be sacked and set aside until seeding time.

"Machines for treating oats and wheat for smut are on the market. In these the grain is passed through a tank containing the formalin solution and then dumped out on the floor to dry. Such machines are not expensive and are very satisfactory.

"Formalin is poisonous, but in this weak solution it will not injure the hands and is perfectly safe to handle. Since the formalin volatilizes rapidly, oats thus treated that are not needed for seeding may after thorough drying and airing, be safely fed to stock."

A loose "gunny" sack or an open split feed basket can be used for dipping the oats in the solution but they must be stirred about so that the grains are all thoroughly wet. A pint of the formalin in 40 gallons of water will treat pretty thoroughly 40 bushels of oats and two men ought to do the work in half a day. But the man who thinks he hasn't time will raise smutted oats next year just as he has been ever since he began farming. We would like to hear from those farmers who have treated their seed oats and learn of their success and what they think about it?

WHAT TO FEED CALVES

A Boone County reader writes that he has a bunch of calves weighing about 600 pounds and wants to know what to feed them to make the cheapest gains. Corn is worth 65 cents a bushel, bran $1.20 a hundred, oil meal $40 a ton. He has on hand clover hay and corn fodder. Can get molasses feed for $31 a ton.

The above inquiry was referred to Professor H. O. Allison, Animal Husbandry Department, State University, who makes the following reply:

Judging from the tone of the inquiry it seems probable that your correspondent wishes to fatter the calves in question for market with the expectation of shipping them during the summer or early fall. A very satisfactory grain ration for this purpose consists of corn 6 pounds to 1 pound old process linseed oil meal. Bran is not ordinarily an economical feed for fattening cattle while some advantage may be gained by feeding it about weaning time there would be little advantage from feeding it throughout the feeding period. Calves of the sort mentioned should take from 1.75 to 2 pounds of grain per 100 pounds live weight when they are doing their best. If corn silage is fed they will take slightly less grain than where dry roughage is used. A combination of clover hay and corn fodder, permitting them to have access to it at will, should prove very satisfactory. The grain should not be discontinued at the time the calves are turned to pasture and every effort should be made to prevent any disturbance or check in the gains they make from the start to finish.

Let Us Stand Together.

I read The Missouri Farmer and think it the best paper circulated in Missouri. I have been talking to my neighbors about organizing a club and I think we can get together and organize if we can only get them to reading and thinking. Farmers, we have been asleep as to what has been going on in the markets in the way of price fixing, but I hope the day is beginning to dawn, so farmers will wake up! I hope in the very near future we will see farmers working together like brothers and stop this fault finding among ourselves while the packers and grain gambler pockets the profits of our hard labor.

Levi Pickard, Howard County.

Buy It Now and Save the Feed
Mogul 8-16 $675 Cash, f.o.b. Chicago

WON HIGHEST AWARD PANAMA-PACIFIC INTERNATIONAL EXPOSITION SAN FRANCISCO 1915 DEPARTMENT OF AGRICULTURE

IT will pay you to buy your Mogul 8-16 now. Judging from our experience, the works will have difficulty in filling the demand for these tractors for spring work. If you order yours now, you will have it when you need it, and the tractor will not cost you a cent for up-keep until you begin to use it.

Besides, there probably will never be a better market for good farm horses than there is this winter. **Buy a Mogul 8-16 now.** Sell your horses in this good market and sell the feed they would consume while standing idle this winter.

Mogul 8-16 is the one light tractor that burns cheap oil fuel—kerosene, benzine, naphtha, and other low-grade distillates—successfully. It costs only **$675 cash, f. o. b. Chicago.** Your local dealer has a sample machine that you can see and study, and he can probably refer you to many farmers who know that the **Mogul 8-16** does, better and cheaper, the heavy work of the farm for which you are now using horses. If he cannot, write us. We can. We will also send you our 100-page tractor book, "Farm Power," which tells fairly why you should own and use a modern **Mogul 8-16** light tractor. Don't delay. Buy it now.

Vol. VIII February 15, 1916 No. 4

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

WHERE IS THE REMEDY?

Suppose we represent all the cultivated crops raised in Missouri by a one-hundred-acre field. If this field was planted to the various crops in proportion to the crops grown in the entire state there would be each year 71 acres of grain, 26 acres of hay and forage, and three acres of the minor crops, including potatoes, cotton, tobacco, broom corn, etc. This does not have reference to pastures but includes only that part of the farm land that is plowed. That means that on the average farm the land is plowed and planted to grain three years for every year it is allowed to stay in meadow. This being true of the average farm it means on thousands of farms the land is plowed four, five or six years for every year it stands in meadow. The man who follows this practice need not wonder when he sees his hillside farm washing away or the soil getting so dry and "lifeless" that a three-weeks drouth will burn up the crops. These are the facts but what is the remedy?

The remedy lies in keeping more live stock, more careful saving of manure, turning under green crops to supply the humus needed in the soil, and a judicious use of other fertilizers than those grown on the farm. An acre of land plowed one year in two with double the yield will make more money than plowing every year and growing half a crop. The number of bushels or tons produced is a much more important factor than the number of acres farmed. Every year in the future it will be more and more necessary to make the acres produce more even if we have to farm fewer acres to do so. Except for truck growers and fruit growers we know of no other class of farmers who can profitably maintain the fertility of the land save the one class of live stock men.

There will always be a demand for meats, for butter and milk, for eggs and poultry, for leather and wool and poverty and ruin would stare this country in the face in a very short time if these necessities were not produced. The question then is shall farmers turn from live stock farming to other lines just because certain interests have got control of the markets and are stealing the producer's profits? Would it not be better for the farmers to act intelligently, to act all together and to save to themselves the waste and the exorbitant profits that are now going to those who have already grown fat on account of our indifference and independence? This is the big question for settlement before the farmers today.

PROTECTING WIDOWS AND ORPHANS

According to the Modern Woodman Head Consul, one of the "well known life insurance companies, through a recognized expert, has followed up all finds that after seven years, more than its death losses of $5,000 or over, and 90 per cent of the beneficiaries have spent or lost the entire amount left to them." It is said that this is practically the experience of every institution paying death losses and it is largely due to the fact that widows have had little or no training in the investment of large sums of money. We merely refer to this in order to call attention to a strong argument in favor of the Gardner Land Bank. If we adopt this system in Missouri and the Land Bank bonds are available in small denominations they will furnish a most excellent and safe investment for all money left to widows and orphans. There will be no question about the safety of these bonds secured as they will be by first mortgage on good farms appraised at twice the value of the bonds and secured also by the working capital and net reserve of the Missouri Land Bank.

Millions of dollars are lost every year not alone to the widows and orphans but to hundreds of persons of small means who have money to invest. Not only will this form of investment be a protection against loss but it will offer encouragement to tenants, to hired men on the farm, to country school teachers and to all other moderate wage earners to save their money and to invest it where it is absolutely safe and will draw a reasonable rate of interest. Just as the Postal Savings Bank has called into use several millions of dollars that was hiding in unsafe places so these bonds, when their safety is understood, will furnish a sound and safe investment for the man of small means who lacks the experience necessary for the safe handling of money.

NATIONAL AID FOR ROADS

For the third time the lower house of Congress has by a very large majority passed the Schackleford Road Bill giving aid to the states in road building. The Bill which passed the House a few days ago and which is now before the Senate is an entirely different measure from the one which passed last year. This Act provides for the "construction, improvement, and maintenance of roads which may be used in the transportation of interstate commerce, military supplies, or postal matter." The Act contemplates an appropriation of $25,000,000 but no appropriation is made in the measure as it passed and as there is now a very large deficiency in the national revenues, it is not very likely that any appropriation will be made at this time. The Act, however, is not a law as it has not yet been acted on in the Senate and as that body has failed to agree to the Bill in previous sessions it may refuse to agree this time.

The money, if appropriate, is to be apportioned to the states as follows: $65,000 to each state and one-half of the remainder in the ratio which the population of each state bears to the population of all of the states as shown by the last Federal census and the other half of such remainder in the ratio which the mileage of rural free delivery and star mail routes in such states bears to the mileage these roads bears to the total in all the states.

Under this apportionment four states would get over a million dollars and Missouri would get $974,114. Not more than one-half the cost of the roads is to be paid by the Government and so if the Act becomes a law and the appropriation is made Missouri will be required to put up not less than the above amount. The surveys and plans for the improvement are to be made by the State Highway Department and all work must be under their control.

Should this Act finally become a law the apportionment to different counties and the kind of road work to be done will necessarily have to be controlled by the Legislature when making a duplicate appropriation. The final approval, however, must rest with the United States Secretary of Agriculture who approves all plans for road improvement before the Government's share of the money is available.

WHOSE FAULT IS IT?

Whose fault is it that the farmer is not getting his full share of the dollar? I suppose not many farmers would admit they were themselves to blame for the present condition of things but if it could have been prevented by farmers and it has not been done, then really is it not their own fault? The trouble with us farmers is that we have never exercised the power we have to better our own condition. We have little power as individuals but we have all the power we ought to have in organization if we will only take advantage of it—then why not do it?

As an illustration of what organization does the wages of an ordinary printer working in a union shop in the town of Columbia has been for the past few years $17 a week—that has been the minimum wage any of these men received and some of them received more. Recently they have demanded a raise of a dollar a week and if the publishers don't agree to pay it they quit—they strike. The writer has made some observation of the general intelligence and ability of these men and as a class we do not hesitate to say that the hired men on the farms of any good agricultural community will rank just as high from any point of view of general intelligence as the printers do yet how many hired men on the best of farms are getting a salary of $17 a week? The farmer says at once he can't afford it—his profits will not allow such wages for his hired men and I know they will not. But if other lines of work pay better wages is it not inevitable that the best men will leave the farm and seek the other places? That is what they have been doing and is the reason why it is so hard to keep competent help on the farm.

Another instance: Just now four of the great railroad brotherhoods are voting on a proposition to demand of the railroads more pay and less hours. If the men should gain this point it will cost the railroads of this country according to their estimates $100,000,000 more than they are now paying. It is generally conceded by those well informed about wages that this class of railroad employes, the engineers, the firemen, the conductors and the trainmen are already the best paid of any class of men for like service and responsibility in this country. But if they should make this demand and the railroads refuse to grant it the result will be a great railroad strike and the loss of hundreds of thousands of dollars, yes, millions of dollars to the business interests of the country.

We are not citing these cases that we want to pass on their merits or to express an opinion on the justness of the demand of the printers or the railroad men for more wages, but to try to show the farmers of this state why it is necessary for them to use their power of organization and why it is going to be ruinous for them to continue as they have in an independent way.

Take the above case of the railroad men. Will it not affect the farmers interests? Railroads get the money to pay wages and for other operating expenses out of their earnings from freight and passenger service and if the present rates will not keep them out of bankruptcy the Interstate Commerce Commission will have no other alternative than to raise the rates. As it is now the farmer's voice amounts to nothing, not even in the fixing of the prices for the products he produces which of course govern the wages he gets for his labor, but if he was organized as the German farmer is organized he could make his wants known in an effective way. But we repeat, whose fault is it that conditions are not better for farmers?

WILL WEEVIL INJURE COWPEAS?

A reader from Caldwell County writes that he has some cowpea seed 1914 crop that is infested with weevil and he wants to know if it is safe to plant them and what time to plant.

In reply we would say that we would consider it safe to plant cowpea seed of the 1914 crop if they have been well cared for. Cowpea seed that were in good condition when thrashed and kept dry ought to germinate satisfactorily but sometimes on account of dampness the peas heat and the germination is injured. I have seen pretty badly weevil infested seed planted which grew fairly well but without seeing the seed could not express an opinion on any particular lot. The thing for our correspondent to do is to take half a pint or so of the seed, count them, then plant them in a box in the house and keep them warm until they germinate then if one-half or two-thirds grow he can plant enough more seed to make up for the loss.

Cowpeas can not be planted as early as corn for when the ground is cold and wet they will rot. They should not be planted until the ground is mellow and warm. They neither like cold or wet. The exact date will depend on the season but I should say the last week in May and first half of June would be a good time to plant in Caldwell County.

To get the ground in shape I would plow as early as the weeds are started good then cultivate a time or two to put the ground in good tilth and to kill the weeds. A cultivation just as the weeds start to grow and before planting will be much better than to try to kill the weeds after the peas are up. Weeds, grass and too much rain we have found the worst hindrances in growing cowpeas.

Pull Out the Stumps

Elsewhere in this issue the reader will find the advertisement of the Hercules Co. of Centerville, Iowa, which puts out the best stump puller on the market and every farmer who has stump land which ought to be raising good crops should drop the company a line and ask them for full information. With this simple device you can pull the biggest stump that grows and you can pull them without the loss of a lot of time. If you have stump land, why not at least investigate.

FEED THE BROOD SOW WELL

There are three things which should be looked after carefully in caring for the brood sow—feed, shelter and exercise. If a man is to succeed he must not neglect any one of these things.

It is entirely too common a practice in the corn belt to feed brood sows only straight corn. This is a practice which should not be followed for several reasons. In the first place, the sow should have more protein or muscle building nutrients in her feed than corn supplies. This is necessary to supply her own body needs, and especially for the litter of pigs which she is going to produce. She must also have a feed which is less constipating in its nature than is corn.

One of the things which must be guarded against, if strong litters are to be produced, is constipation in the brood sow. . The things which commonly cause constipation in the brood sow are too much corn and too little water and exercise. A sow should also have more bulk and more mineral matter in her ration. Corn, when fed alone, is too fattening and the fat is added internally which is injurious to the development of the unborn pigs.

Corn is all right if fed with judgment. In the Corn Belt it naturally makes up a large part of our swine rations. When fed to sows, however, it should be supplemented with some feed like linseed oil meal or tankage, shorts and perhaps a little bran. Another good feed to use is alfalfa hay or alfalfa meal. Clover or cowpea hay, if not too coarse, also supplies bulk, protein, and the laxative effect desired. Every hog man will want to plan a special ration using the feeds which he has at hand that will give the best results; but a few good ones for the brood sow will be suggested, taking the following as a basis:

Corn, 50 parts by weight; Shorts, 25 parts; Alfalfa hay or bran, 15 parts; Linseed oil meal, 10 parts.

Of course the feeder will want to use alfalfa hay and other home grown feeds so far as possible, but if they are not available, bran or similar feeds should be purchased to go with the corn. If tankage is used instead of oil meal, only half as much of it need be fed. L. A. Weaver,

Missouri College of Agriculture.

WHAT AILS THE HORSES

At this time of year when many horses are idle and perhaps running in dry stalk fields, around straw or hay stacks and getting little grain, there is apt to be serious trouble and many horses die under these conditions and the cause is charged up to "corn stalk disease" and as no one not even veterinarians understand exactly what that means and as no certain remedy has been found for it the farmer just charges his loss up to "bad luck" and let's it go at that. At this time of year horses are very apt to be neglected about watering and as they must get their drink from icy ponds or ice covered troughs they do not drink as much water as they ought to have and the result is that with the digestive tract filled with this dry innutritious feed the consequence is impaction and very probably death.

We would not advise keeping idle work horses in the barn and feeding heavily on grain, but if they have a good open shed to go under at will, where they can have a dry bed and then if they are fed plenty of bright hay and corn fodder they will not need much grain until a short time before spring work, but they should have enough laxative feed to keep their bowels in good condition. If the hay is bright and there is some clover, cowpea or alfalfa hay there will be little danger but where the hay is mouldy or even where it consists only of prairie or timothy, a lttle bran, oats or oil meal fed once a day will be a lot cheaper than to lose a good horse or two as is often the case.

Oats straw is a very good laxative feed if bright and cut early but of course it will not take the place of grain. The laxative effect of these feeds as well as their nutritive benefit will keep the horses in so much better condtion than those fed roughage only that it wlll take much less time and feed to get them ready for work in the spring.

CLEAN YOUR SEED GRAIN

Clean your seed grain now. It will pay to do it well. The average mill of farm size will clean about 320 bushels in a day. If you take out only 10 per cent for seed grain, you will get 32 bushels a day at a cost of from 5 to 10 cents a bushel for cleaning and grading. Experiment station records show that grain so graded will increase the yield from 10 to 25 per cent under normal condtions. It does not take much figuring, therefore, to see that time spent in doing a thorough job of grading and cleanng seed grain may be among the most profitable days of the farm year. The increase in yield is practically all net profit. Seed grain that is well selected and graded from year to year wll not run out, but should improve, if properly handled.

Before seeding, treat the seed grain for smut. One pound of formalin mixed with 40 gallons of water will treat about 40 bushels of grain. The loose smut of oats and the kernel smut of wheat causes the loss of millions of dollars every year. Few untreated fields escape.

Thorough fannning and grading of seed grain and treating for smut are some of the simplest yet most effective things that can be done to turn the trick of increased yields.—P .E. Miller, West Central School of Agriculture, Morris, Minn.

WOOD ASHES FOR CORN

The Missouri Farmer:

Would you please tell me what you think of mixing wood ashes with fertilizer to be put on corn 60 to 75 lbs. to the acre in the hill. I thought of using it for the potash. How much could be used with safety?

R. P. Horning, Barry County.

The above inquiry was referred to Professor M. F. Miller, department of soils State University who makes the following reply:

Wood ashes are so variable in composition, depending upon the way they have been kept that it is impossible to state with very great accuracy the results from their application to corn. The best grades of hard wood ashes which have been kept in the dry will contain from 5 to 7 per cent of potash and from 2½ to 4 per cent of phosphoric acid. If they have been allowed to leach by the rain the content of potash may be reduced to as low as 1 per cent at times, with a slight reduction only in the phosphoric acid. Average wood ashes as they occur with only a medium amount of leaching will contain from 2 to 4 per cent of potash. Such ashes contain enough potash for a corn fertilizer on most soils but not enough phosphoric acid. If one would mix 100 pounds of 14 per cent acid phosphate and 100 pounds of such wood ashes, thoroughly sifted so that the cinders were all removed, this would give a fair fertilizer for corn to be applied in the hill at the rate of 100 pounds per acre. This would not be a high grade fertilizer by any means,but would give fair returns. If one wished to expend a little more money and had steamed bone meal available, and if he would mix 100 pounds of steamed bone meal and 100 pounds of the wood ashes and use 100 pounds per acre in the hill, he would have a little more satisfactory form of fertilizer for corn. Of course, on many lands the application of wood ashes alone will materially benefit the corn crop, but these had best be applied broadcast at the rate of 500 to 600 pounds per acre and thoroughly worked into the soil before planting the corn. So very much depends on the amount of leaching which has taken place in the wood ashes that 200 pounds of high grade wood ashes might equal 800 pounds of leached wood ashes.

Steel Fence Posts

The Janesville Barb Wire Co. is advertising a new steel fence post which should interest many of our readers. Look up the advertisement and ask the company to give you full information. Please mention The Missouri Farmer.

BARNYARD GOSSIP

For want of space and for other reasons not necessary to mention the paragraphs under the above head have been omitted but from now on we will endeavor to have them appear in every issue. We appreciate the several complimentary things some of our readers have expressed concerning the sentiments contained in many of these notes and in resuming this column we hope that, now and then, something may be said that will arouse our readers to greater effort not alone in their own behalf but that they will take a more active interest in the affairs of the community, the state and the Nation. People in the ordinary walks of life and particularly farmers do not realize the power they could have in directing the affairs of this country and they will not find it out until they assert their rights and make their views known to those clothed with official power.

* * *

This is a very grave period in the world's history and in the minds of some of our ablest writers there is a fear that civilization and Christianity will have retrograded several centuries when this awful European war is ended and peace restored among the present belligerent nations. Even in this country, separated from the battlefields by thousands of miles of ocean it will take at least a generation to wipe out the feelings of jealousy and hatred between people of opposite sympathies for the different countries engaged in war. Between the people engaged on the two sides of this great war in Europe the feeling of hatred will not be forgotten in a hundred years and where there is hatred in the heart there is no progress in Christianity. It has now been more than fifty years (54 years to be specific) since the writer as a boy was permitted to visit his father in a military prison during the Civil War and do you know that with all that has been said and done for peace in this country the horors and misery of that old prison come back to me at times in spite of all I have done to try to obliterate it from my memory. Any one not altogether ignorant of human nature knows that these dim meomries of the imperfect human mind are like the near-dead embers of the smothered fire and they need only the fanning of the breeze to cause a new conflagration. And just so it will be after this war and after all other wars, no matter how much we may strive and how much we may pray to efface its memory. Who is it that is not willing to make sacrifices for peace?

Speaking before the military committees of the National Congress a few days ago one speaker said what has so often been said and never substantially refuted, that the clamor for preparedness came largely from those who were making immense profits selling ammunition and who at the close of the European war will want a large army and navy to enforce the collection of the money owed them by the bankrupt nations. "The working people will not consent to fight such a war. Instead of spending more money I think Congress ought to investigate the money already spent. The people have been told we were prepared. We were told we were the greatest power on earth. Now suddenly we are told our battleships are old tubs, our army helpless. There were no rumors of war two years ago when European countries were in the best condition of their history. Why be afraid now when those countries have about exhausted their credit, have lost millions of their best men and have had billions of their resources sfallowed up in the present conflict. We of the working classes want to know the truth about the danger we are in, if in fact we are in any danger. It is the working peopl,e the farmers, the artisans of the country who will be called upon to do the fighting and they have a right to know why this great alarm of danger that the president seems so scared about. The working men will refuse to be cannon fodder for the wars and then be called upon to pay the bills too. If it is right to take the working man's life to protect the rich man's property it is certainly right to take the rich man's fortune to pay the toll of war." But this is exactly what they are not going to do. If this preparedness scheme goes through it will be the man from the ordinary walks of life who fills the ranks and we suppose they will tax the poor man on his notes, his deeds, his medicine, his gasoline, his sugar and other necessities to pay the bill, just as they are now doing.

* * *

In speaking before the House Naval Committee February 8, Rear Admiral Blue, chief of the Bureau of Navigation, declared that the American navy was now ready to meet any enemy it might be called upon to encounter in the Pacific Ocean. If Rear Admiral Blue knows what he is taking about —and who knows any better than he does?—then why all this scare about Japan swooping down upon us over night and capturing our whole Pacific coast? Oh, it is only another of those war lies we have heard so often!

* * *

Every man and woman in this land no matter how humble a position they fill has an influence that will count if used as well as a duty to their country in this hour of peril. Those who would alarm the country from the President down have had their say and now it is the duty of the common people—the people who always fight the battles of a country engaged in war—to make themselves heard. How can you do it? If every man and woman who wants peace and who believes that this country can maintain its honor and peace by attending strictly to its own business without the burden of maintaining the greatest standing army and the greatest navy of the world—I say if every such person will write three letters it will stop this military spirit which is getting such a start in the United States. You need say no more than that you are opposed to this military policy and send a letter to the President, one to your Congressman and to one or both of the Senators from this state. These men may not read your letters but their secretaries will and they will know what you think about it. The other side has already been heard and if you want to be heard before this war burden is fastened upon you, your children and your great grandchildren you had better do your duty now.

* * *

Do not think for one moment that the wealth of this country and the industries which have grown unprecedently because of the war will pay the debt. Did the President propose to tax war munitions and automobiles sent abroad, the bonds which have been sold at great profit to furnish belligerents money to continue the war? Thousands of people have grown immensely rich since the European war began, but they propose to taxe the poor man to pay for preparedness just as they have always done. Tax on gasoline, on notes, on the poor mans' medicines—these are some of the things that the President has said should pay the bill. Just write him and tell him what you think about it. Write today.

Got Any Stump Land?

If you have any stump land you ought to ask the Hercules Mfg. Co. at 191 24th Street, Centerville, Iowa, to send you their catalogue describing their wonderful Stump Puller which will enable you to easily clear an acre of land per day—and it doesn't matter how big the stumps are, it pulls them out roots and all. The Missouri Farmer recommends this concern without hesitation. Why not make your stump land produce a bumper crop of corn?

Hundreds of farmers have sent us a dollar during the last ten days saying, "I like your paper better than any other I have ever read. I didn't subscribe for it in the first place but that makes no difference. I am with you." How about you friend? We are fighting your battle.

PRIZE WINNERS

Are Fed Balanced Rations

Glencarnock, the famous steer, which won 1st prize at the last International, was fed a balanced ration to secure quick growth, depth of fleshing, finish, and good gains. J. A. Stainbrook, Franklin, Ind., whose bushel of corn won the grand championship at the last National Corn Show, fed his crop with a balanced plant-food ration (fertilizer) to secure quick growth, early maturity, solid ears, and a good crop of well ripened corn.

P&O

Two Row
Cotton Planter

Successfullly plants cotton (or corn) in checked rows, permitting cross cultivation and placing the plants far enough apart to let the sun get to the roots and destroy the boll weevils, which thrive only in dark and sheltered places. "It's the Way We Build Them."

The use of the P & O Check Row Cotton Planter also saves chopping, the chopping being done when the seed is planted because it is planted in hills. And it saves fully one-half the amount of seed required by other methods. Built in two styles, one with narrow set-over wheels and shovel coverers, the other with wide open center or concave tire wheels which cover the seed. Seed drops directly into bottom of the shank; no chance to clog. Sight feed. Removable hoppers. One piece agitator and gear. Reverse feed wheel. Adjustable in width. Side reel. Runner or disc furrow openers. Can be equipped with Fertilizer Attachment. Can be furnished for check row planting or drilling.

POINTERS FOR POULTRY RAISERS

Already some of us have begun to "count the chicks before they hatch and now the thing to do is to be able to count the same numbers after they hatch. A little later on there may be a difference, a somewhat different count; on which side of the ledger are you planning to do your figuring? Now is the time to make your start and to start right then later on you will not have occasion to say to yourself, "If I had only done so and so I might have had better luck. Do not blame your luck if you suffer losses, blame your non-use or lack of common sense and good judgment. Luck may be a very important factor but luck generally comes to the one who does things right.

To hatch strong healthy chicks you must start with strong healthy eggs. Common sense tells us that we cannot get more out on egg than there is in it. Take for example an egg that has been laid by a poor undeveloped pullet, is it natural to expect that the chick hatched from this egg is going to be a strong and vigorous youngster? The chances are that you are not going to be very proud of that chick. You may be at the beginning but you are doomed to disappointment later. Suppose you hatch eggs laid by mature hens, hens that are suffering from an internal disease such as white diarrhea, bacillary form (this disease is known to be hereditary transmitted from the parent stock to the chick through the yolk of the egg) have you even the faintest idea how many of the little chicks you are going to lose by death or the health of those that remain alive. How many will be disease carriers for future losses? To hatch strong healthy chicks you must hatch from strong healthy stock.

Did you ever stop to try to estimate the numbers of little chicks that die, those that are needlessly slaughtered each year? Of course you have no way to estimate the total losses nor to even attempt to make a guess as to the numbers but we do know however, that the losses are something enormous. To check this awful mortality there are certain fundamental principles that we must follow, certain duties that we must perform in order to raise the delicate chicks. Countless numbers of the little chicks are lost by any one of the following causes:

(1) Low constitutional vigor and vitality of the breeding stock.
(2) Improper incubation.
(3) Faulty brooding.
(4) Chilling.
(5) Over-heating.
(6) Over-crowding.
(7) Filth.
(8) Poor food.
(9) Poor ventilation.
(10) Disease germs (Pathogenic Bacteria).

Too much emphasis cannot be laid upon the disinfection, care, and operation of the incubator regardless of the make used. All of the parts of the incubator that come in direct contact with the little chicks should be thoroughly cleaned and disinfected each time before use. How many of us know what disinfection, thorough disinfection, means? Disinfection means to purify, in other words to get rid of the disease germs, to make pure. When the time comes to disinfect thoroughly how are you to proceed? First scrape all the droppings, accumulated filth and dirt out of the incubator and then wash with good hot soap suds and water. After washing apply the disinfectant using at least a five per cent. solution, five parts of the disinfectant to ninety-five parts of water. In the purchase of the disinfectant be sure to purchase a disinfectant that will disinfect, that will purify, not one that has a strong odor. You cannot tell the strength of a disinfectant simply smelling it, so for that reason it is advisable to know its strength. The U. S. Government spent considerable time and money working out the strength of disinfectants and a report of their experiments is issued as Hygenic Laboratory Bulletin No. 82. In reading this bulletin one may learn how the strengths of the various commercial disinfectants vary, some are strng, others weak. By the strength of the disinfectant is meant its power to destroy disease germs not its power to burn the flesh nor to poison people or animals. The strengths of the disinfectants were determined by comparing the action (germicidal) of known volumes of each disinfectant with known volumes of pure carbolic acid (phenol) upon certain disease germs. From these tests it was observed that some of the disinfectants were twice, and even five and six times as strong as pure carbolic acid (phenol) itself. The strength of the disinfectant as compared to the strength of pure carbolic acid (phenol) is known as the "phenol coefficient." If the phenol coefficient of a disinfectant say is five (5) we are to understand by that, that the disinfectant is five times stronger than pure carbolic acid (phenol) and where it takes five parts of pure carbolic acid to kill the germs it will take only one-fifth as much of the disinfectant to do the same amount of work. In purchasing disinfectants be sure that you look for the words "Hygenic Laboratory phenol coefficient" on label of the container.

After applying the disinfectant to the incubator it is best to place the incubator in the sunlight, allowing it to bathe in the sun for several hours. It is then ready to be started or tested out before use.

If you have thoroughly disinfetced the incubator, started with normal healthy eggs and given the little details your strict undivided attention you may rest assured that there will not be any regrets later.

Geo. D. Horton,
Mountain Grove, Mo.

SUGGESTIONS ON ARTIFICIAL INCUBATION OF HEN'S EGGS

The season for hatching eggs is approaching and many farmers will be interested in the following notes on the use of incubators. They are taken from Farmers' Bulletin No. 585, U. S. Department of Agriculture, "Natural and Artificial Incubation of Hen's Eggs." The bulletin may be obtained from the department at Washington.

Follow the manufacturer's directions in setting up and operating an incubator.

See that the incubator is running steadily at the desired temperature before filling with eggs. Do not add fresh eggs to a tray containing eggs which are undergoing incubation.

Turn the eggs twice daily after the second and until the nineteenth day. Cool the eggs once daily, according to the weather, from the seventh to the nineteenth day.

Turn the eggs before caring for the lamps.

Attend to the machine carefully at regular hours.

Keep the lamp and wick clean.

Test the eggs on the seventh and fourteenth days.

Do not open the machine after the eighteenth day until the chickens are hatched.

Chicken Mites

The red mite is one of the greatest enemies of the poultry raiser. This is a spider-like insect and is very common. Its habits are entirely different from those of lice with which it is often confused. Mites hide in the dark damp places in the poultry house, and can be found in the cracks and under the roosts. At night they crawl upon the bird and gorge themselves with blood.

The Missouri Agricultural Experiment Station gives the following treatment for the extermination of mites. The treatment must be applied not to the bird but to the roosting quarters. The interior of the house should be sprayed thoroughly with one of the coal tar disinfectants, kerosene emulsion, or lime sulphur spray, such as is used in spraying trees. The roosts should be painted with the above remedies. The roosting places should be light, dry and well ventilated, as mites do not breed under these conditions. Thorough treatment is necessary to successfully combat this costly pest.

Indications of Tender Poultry

Smooth skin and scales, soft cartilage at the end of the breast or keel bone, and tender skin under the wings, which is easily torn by bending back the wings, indicate tenderness in poultry, according to the Nebraska College of Agriculture. The flesh should give easily and gently when pressed with the finger. Long hairs, long thin necks, loose skin, long spurs, and feet with sharp scales indicate aged and, therefore, tough poultry.

Why Clutter

Your House

With pipes and flues? They cost money for labor and material, mar your house and waste fuel. Heating pipes are needless. The Caloric Pipeless Furnace heats the entire house with just one register. You get the greatest amount of heat with the least fuel consumption and the heat is uniform throughout the house. The

PIPELESS CALORIC FURNACE
TRADE MARK TRADE MARK

can be easily installed in any house, new or old, because you don't have to cut holes for pipes. It burns coal, coke or wood and is guaranteed to save 35% of your fuel. You can easily and economically have this city comfort in your farm home. Avoid the labor of building fires, of carrying fuel and ashes up and downstairs The Caloric lessens fire danger. Will not spoil produce in cellar.

Guarantee

The most unusual ever written. If the Caloric is not entirely satisfactory we'll make it so any time within one year. You take absolutely no risk. Write for

90 bu. per acre from stump land!

When David Bennison of Iowa bought a sixty acre tract of Cypress covered land near New Madrid, in

Southeast Missouri
along the Cotton Belt Route

the neighbors laughed at him. But Bennison knew good corn land. He cleared that tract, planted corn, and the first yield—grown among stumps—brought 90 bu. per acre. The wonderful depth and fertility of soil there is amazing. 90 bu. per acre there is better than average but not uncommon. Mr. Mahoney of Dexter, Mo. says "Last year our corn yielde1 75 bu. per acre. We have made 90 bu. and it will run above 60 bu. an acre year in and year out". Mr. Hunter of New Madrid says many of his fields of corn average 80, 90 and 100 bu. per acre. There isn't a richer soil in America than that in Southeast Missouri.

There isn't a section anywhere where you can buy rich land so cheap that the first staple, field crop will pay for its cost and clearing (if you buy unimproved). And that rich soil makes wonderful yields of anything. C. D. DeField of East Prairie says "We cut our alfalfa every 28 days; five times a season. It averages a ton per cutting. Clover does well; in fact any kind of feed or pasture. I raised 40 mules last year without doing any winter feeding at all. Cattle and hogs go through winter here without feeding." 90 bu. per acre corn land at $35 will go quick; act!

Free book—illustrated!

A farmer wrote it; and he knows what you want to know about a section new to you. Tells about character and cost of lands, climate, crops raised, etc., and about schools, churches, towns, social conditions. Brimful of actual photograph pictures "taken on the ground." Send today and get this free book.

The Plunderer

By ROY NORTON

Author of "The Garden of Fate"

(Continued from last issue)

The daylight came, and with it the boom of the night shift setting off its morning blasts, and clearing the way for the day shift that would follow in sinking the hole that must inevitably betray the dishonesty of the stern mine master at the foot of the hill. Dick had not slept, and turned to see a shadow in the door.

"Don't you get up, Dick," Bill said. "Just try to rest. I heard you tumblin' around all the night. You don't get anywhere by doin' that. A man has to take himself in hand more than ever when there's big things at stake. Then's when he needs his head. You just try to get some rest. I'll keep things goin' ahead all right, and there ain't no call to do nothin' for a week or ten days—till we get our feet on the ground. After that we'll find a trail. Don't worry."

Through the kindly tones there ran confidence, and, entirely exhausted, Dick turned over and tried to sleep. It came to him at last, heavy and dreamless, the sleep that comes beneficently to those who suffer. The sun, creeping westward, threw a beam across his face, and he turned restlessly, like a fever-stricken convalescent, and rolled farther over in the bed.

The beam pursued him, until at last there was no further refuge, and he sat up, dazed and bewildered, and hoping that all had been a nightmare, and that he should hear the cheery note of the whistle telling him that it was day again, and calling the men of the Croix d'Or to work.

It was monstrous, impossible, that all should have changed. It was but yesterday that he had returned to the mine with finances assured, confidence restored, and the certainty that Joan Presby loved him, and could come to his side when his work was accomplished.

He looked at his watch and the bar of sunlight. It was four o'clock, and the day was gone. Everything was real. Everything was horrible. He crawled stiffly from his bed, thrust his head into the cold water of the basin, and, unshaven, stepped out to the porch and down the trail.

The plumes of smoke still wreathed upward from two stacks. Bill was still driving downward unceasingly. The mellow clang of the smith's hammer, sharpening drills, smote his ears, and the rumble of the cars. The cook, in a high, thin tenor, sang the songs with which he habitually whiled away his work. Everything was the same, save him! And his air castles had been blown away as by the wind.

In a fever of uncertainty, he stood on the hillside and thought of what he should do. He believed that it was his duty to be the one to break the harsh news to Joan, and wondered whether or not she might be found at the tryst. He remembered that, once before when he had not appeared, she had ridden over there in the afternoon. Perhaps, expecting him, and being disappointed, she might be there again.

He hurried down the slope, and back up across the divide and along the trail, his hopes and uncertainties alone rendering him certain that she must be there, and paused when the long, black line shone dully outlined in its course around the swelling base of the hill. He experienced a thrill of disappointment when he saw that she was not waiting, and again consulting his watch feverishly, tramped backward and forward along the confines of the hallowed place.

At last, certain from the fresh hoof marks on the yielding slope, that she had come and gone, he turned, and went slowly back to the mine. He had a longing to see his partner, and learn whether or not Mathews, with that strange, resourceful logic of his, had evolved some way out of the predicament. But Bill was nowhere in sight. He was not in the office, and the mill door was locked. The cook had not seen him; and the blacksmith, busy, stopped only long enough to say that he thought he had seen the superintendedt going toward the hoisting house.

"Have you seen Bill?" Dick asked of the engineer, who stood at his levers, and waited for a signal.

"He's below," the engineer answered, throwing over an arm, and watching the cage ascend with a car of ore.

It trundled away, and Dick stepped into the cage. The man appeared irresolute, and embarrassed.

"He'll be up pretty soon, I think," he ventured.

"Well, I'll not wait for him," Dick said. "Lower away."

The man still stood, irresolute.

"Let her go, I said," Dick called sharply, his usual patience of temper having gone.

"But—but——" halted the engineer. "Bill said to me, when he went down, says he: 'You don't let any one come below. Understand? I don't care if it's Townsend himself. Nobody comes down. You hold the cage, because I'll send the shift up, and 'tend to the firing myself.'"

For an instant Dick was enraged by this stubborness, and turned with a threat, and said: "Who's running this mine? I don't care what he said. You haven't understood him. Lower away there, I say, and be quick about it!"

The rails and engine room slid away from him. The cage slipped downward on its oiled bearings, as if reluctant, and the light above faded away to a small pin-point below, and then died in obscurity, as if the world had been blotted out. Only the sense of falling told him that he was going down, down, to the seven-hundred-foot level, and then he remembered that he had no candle. The cage came to a halt, and he fumbled for the guard bar, lifted it, and stepped out.

Straight ahead of him he saw a dim glow of light. With one hand on the wall he started toward it, approached it, and then, in the hollow of illumination saw something that struck him like a blow in the face. The hard, resounding clash of his heels on the rock underfoot stopped. His hands fell to his sides, as if fixed in an attitude of astonishment. Standing in the light beyond him stood Joan, with her hands raised, palms outward.

"Stop!" she commanded. "Stop! Stay where you are a moment!"*

Amazed and bewildered, he obeyed mechanically, and comprehended rather than saw that, crouched on the floor of the drift beyond, his partner knelt with a match in his hand, and in a listening attitude. Suddenly, as if all had been waiting for this moment, a dull tremor ran through the depths of the Croix d'Or. A muffled, beating, rending sound seemed to tear its way, vibrant, through the solid ledge. He leaped forward, understanding all at once, as if in a flash of illumination, what the woman he loved and his partner had been waiting for. It was the sound of the five-o'clock blasts from the Rattler, as it stole the ore from beneath their feet. It was the audible proof of Bully Presby's theft.

"Joan! My Joan!" he said, leaping forward. "I should have spared you this!"

But she did not answer. She was leaning back against the wall of the tunnel, her hands out-stretched in semblance of that cross whose name was the name of the mine—as if crucified on its cross of gold. The flaring lights of the candles in the sticks, thrust into the crevices around, lighted her pale, haggard face, and her white hands that clenched themselves in distress. She looked down at the giant who was slowly lifting himself from his knees, with his clear-cut face upturned; and the hollows, vibrant with silence, caught her whispered words and multiplied the sound to a sibilant wail.

"It's true!" she said. "It's true! You didn't lie! You told the truth! My father—my father is a thief, and may God help him and me!"

CHAPTER XVIII

THE BULLY MEETS HIS MASTER

The ache and pain in her whole being was no greater than the colossal desire Dick had to comfort and shield her. He rushed toward her with his arms reached out to infold, but she pushed him back, and said horasely: "No! No! I sha'n't let you! It would be an insult now!"

Her eyes were filled with a light he had never seen in them before, a commanding flame that held him in check and stupefied him, as he tried to reason why his love at that moment would be an insult. It did not dawn on him that he was putting himself in the position of one who was proffering silence for affection. All he knew was that everything in the world seemed against him, and, overstrained to the breaking point, he was a mere madman.

"You brought her here?" he hoarsely questioned Bill.

"I did."

"And told her that her father was under us?"

"Yes."

"And that I was to be kept above ground?"

"Of course, and I had a reason, because—"

He did not finish the sentence. The younger man shouted a furious curse, and lunged forward and struck at the same time. His feet, turning under a fragment of rock, twisted the directness of his blow so that it lost force; but its heavy spat on the patient face before him was like the crack of a pistol in that underground chamber.

Bill's hands lifted impulsively, and then dropped back to his sides, hanging widely open. The flickering candlelight showed a slow red stream emerging slowly from one of his nostrils, and running down across the firm chin, and the pain-distorted lips. In his eyes was a hurt agony of reproach, as if the knife of a friend had been unexpectedly thrust into his heart. Dick's arm, tensed by the insane anger of his mind, was drawn back to deal another blow, and seemed to stop half-way, impotent to strike that defenseless face before him.

"Why don't you hit again, boy? I'll not strike back! I have loved you too much for that!"

There was a world of misery and reproach in the quiet voice of the giant, whose tremendous physical power was such that he could have caught the younger man's arm, and with one wrench twisted it to splintered bone. Before its echoes had died away another voice broke in, suffused with anguish, the shadows waving on the walls of gray rock twisted, and Joan's hands were on his arm.

"Dick Dick! Are you mad? Do you know what you are doing?"

He shook her hands from his arm, reeled against the wall, and raised his forearm across his eyes, and brushed it across, as if dazed and blinded by a rush of blood which he would sweep away. He had not noticed that in that staggering progress he had fallen full against a candlestick, and that it fell to the floor and lay there between them, with its flame slowly increasing as it formed a pool of grease. For the first time since he had spoken, the huge miner hoved. He stepped for-

PRINCE ALBERT

the national joy smoke

puffs its kindly way right into your good will because it is so friendly and cool and fragrant. You may smoke it as long and as hard as you like and it will not bite or parch or tire your taste! The patented process by which Prince Albert is made *fixes that!*

You smokers should realize that the Prince Albert patented process is owned exclusively by us; that no other tobacco can be like Prince Albert. And you'll find out how different P. A. is from any other tobacco you ever smoked just as soon as you try it *and know for yourself* that what we tell you is *proven by your own test!*

Buy some today and smoke it in your old jimmy pipe or roll it into the best makin's cigarette you ever put in your mouth. *It will absolutely delight you!*

Buy Prince Albert everywhere tobacco is sold. Toppy red bags, 5c; tidy red tins, 10c; handsome pound and half-pound tin humidors—and—in that fine crystal-glass humidor with sponge-moistener top that keeps the tobacco in such splendid condition—always!

On the reverse side of this tidy red tin you will read: "Process Patented July 30th, 1907," which has made *three* men smoke pipes where *one* smoked before!

R. J. REYNOLDS TOBACCO COMPANY, Winston-Salem, N. C.

ward, and ground the flame underfoot.

"There might be a stray cap around here soemwhere," he said.

His voice appeared to rouse the younger man, and bring him to himself. He stepped forward, with his hands behind him and his face still set, wild and drawn, and said brokenly: "Bill! Bill! Strike back! Do something! Old friend!"

"I cain't," came the reply, in a helpless monotone. "You know if it were any other man I'd kill him! But you don't understand yet, and—"

"I made him bring me here," Joan said, coming closer, until the shadows of the three were almost together. Her voice had a strange hopelessness in it, and yet a calm firmness. "He came to talk it over with me, on your account. Pleading your cause—begging me that, no matter what happened, I should not change my attitude toward you. Toward you, I say! He said your sense of honesty and loyalty to Sloan would drive you to demanding restitution even though it broke your heart. He said he loved you more than anything on earth, and begged me to help him find some way to spare—not me, or my father—but you!"

Dick tried to speak, but his throat restricted until he clutched it with his fingers, and his lips were white and hard.

"I did not believe that what he said was true," the voice went on, coming as from depths of desolation and misery, and with dead levels dulled by grief beyond emotion. "I have believed in my father! I thought there must be some mistake. I demanded of your partner that he lay off his own shift, and bring me here where we might listen. Oh, it was true—it was true!"

She suddenly turned and caught the steel handle of a candlestick in her hand, and tore its long steel point from the crevice.

"But I've found the way," she said. "I've found the way. You must come with me—now! Right now, I say. We shall have this over with, and then—and then—I shall go away from here; for always!"

"Not that," Dick said, holding his hands toward her. "Not that, Joan! What are you going to do?"

"I'm going to my father. He, too, must be spared. He must give it back. It must never be known. I must save him disgrace. It must be done tonight—now!"

She started down the drift toward the cage, walking determinedly, and Dick's lips opened again to beg her to come back; but Bill's hand was on his shoulder, and his grave and kindly voice in his ear.

"Go with her, boy. She's right. It's the only way. Have it over with tonight. If you dont' you'll break her heart, as well as your own."

They followed her to the cage, and the big miner gave the hoisting bell. The cage floated upward, and into the pale twilight. Heedless of anything around, they walked across the yard, and turned into the roadway leading down the gulch.

"Will you come?" she asked, turning toward Bill.

"No," he said slowly. "I'm not needed. Besides, I couldn't stand another blow today!"

It was the only reference he ever made to it, but it went through Dick with more pain than he had administered. Almost sullenly he followed her down the road, wordless, bewildered, and despairing. Unable to spare her, unable to shield her, unable to comfort her, and unable to be other than true to his benefactor, he plodded after her into the deeper shadows of the lower gulch, across the log bridge spanning the brawling mountain stream, and up into the Rattler camp. Her steps never faltered as she advanced sraight to the office door, and stepped inside.

The bookkeepers were gone, and the inner door ajar. She threw it open, walked in, and closed it after Dick, who sustained a deadly anger against the man who sat at his desk, and as they entered looked up with a sharp stare of surprise.

(Continued in next issue)

It is going to take some time to get a state-wide organization of farmers strong enough to do much but we now offer you a good start if you will join the Farmers' Market Club. It will help you in both buying and selling.

By Old Jim Riley

If the army ain't strong enough to lick the "greasers" the President might call in the Anti-Horse Thief Association. The only other feller besides the farmer that never organized was the American Indian and as a result the only thing he ever made a howlin' success of was dyin'. I understand the drug store has got in a new supply of Old Crow, so I wouldn't be surprised to see that Professer feller git the grip agin.

BUCKSHOT BY THE PROFESSOR

A pile of farmers are studying the "Balkan situation" while they ought to be testing their seed corn.

When a man's wife and children think he's the best man in the World you are mighty near certain to hear his neighbors speak well of him.

Have you sent in your dollar to the paper yet? Don't put it off any longer—because after awhile you'll forget it altogether.

I know an old skeezicks who is so all fired stingy that he took some dope to make him bald-headed so he wouldn't have to spend a quarter to get a hair cut.

Look over the advertisements in this paper and then drop a postal card for further information to those that interest you. They contain a lot of valuable information.

I was glad to get rid of the "Hez" Brown crowd because I really didn't have room for them. But some of those old hayseeds are pretty fair chaps after all and it will be worth your while to watch for the "Possum Holler Doins."

The day's happiness depends a lot on how we start in in the morning. If you begin by being cross and surly to Mother and the kids and kick the dog around a few times you are pretty certain to have a headache by noon—and may be something worse by night.

Some fellows think the Hessian fly is going to give us a lot of trouble again this spring—but though they do their worst, they won't be in it with the pestiferous swarm of political candidates who will soon be sitting on the fence waiting for us to "finish the round."

No doubt, gentle reader, you noticed the slander pronounced against me in the last issue by that Jim Riley person. But I refuse to stultify myself by replying to his villainous accusation. On the contrary I shall treat him with silent contempt and stand on my character in the hands of my friends.

They turned some blood hounds loose to trail a bank robber over in Kansas the other day—and as soon as they were unleashed they took after the sheriff and made him climb a tree. Of course the sheriff didn't rob that particular bank—but may be the dogs thought he ought to be run in on general principles.

Don't you think it would be a splendid idea for you and your neighbors to form a "Farmers' Market Club" of a dozen members so you can get wholesale prices on carload shipments of bran, shipstuff, oats, flour, fertilizer, etc.? Wouldn't such a little organization save you hundreds of dollars? All it needs in any neighborhood is a leader. Won't you start the ball rolling?

'POSSUM HOLLER DOINS

Most of the bunch turned up at "Hez" Brown's store the other afternoon and somebody laughed about the way old "Josh" Simpson came near choking to death on dried apples the other day when old "Hez" broke in and said: "Well, it ain't no laffin matter to me cause dried apples cost money and if that old varmint don't quit sneakin' 'em thars goin' to be trubble." At this, old "Chouce" Baker got "sore" and said real mean like, "'Hez,' your so durn stingy that if old Saint Peter told you it cost a quarter to git into heaven you'd ask him to let you examine the other place fust." At this stage of the proceedings Judge Haskins dropped in for a sack of flour and a quarter's worth of "smokin." Now there is no man in Possum Holler who is looked up to more than the Judge who served two terms on the County Court Bench and who also owns one of the best farms in the "Holler." The Judge had hardly "lit" when "Jep" Thompson said, "Jedge, what do you think uv the President's speeches and western trip?" He had hardly gotten the words out of his mouth when old "Chouce" growled, "Why don't you ask him what he thinks about them pink tea notes too?" "Jep" glowered at him in scornful silence and presently the Judge said: "Well now seriously speakin' I think the President made a good impression judgin' by the crowds and the eddytorials in nearly all newspapers—irrespectve of politics. Of course Woodrow has kinda gone back on his former believes but the best uv us have to do that once in a while. Fact is I am kinda switchin myself. I don't want this to become a country where we pay more attention to learin' how to fight than we do to learin' how to grow more corn to the acre and how to put more fat on a steer's back at less cost—but just the same we'v got to have a navy big enuf to protect our commerce on the high seas and to hold our own agin anybody that might want to monkey with the Monroe Doctrine. I don't know what there is to this Japanese stuff but if them scamps are lookin' for trouble I want us to be prepared fur 'em—and then, too, I'd like to make England let our cotton alone. Altogether I am stronger fur a big Navy than I am fur a big Army cause it strikes me that if we have the fust we won't need the second"—and this seemed to be the general consensus of opinion and if there was anybody present who disagreed wth the Judge he kept his mouth shut.

This special proposition good during January and February only. Write for it today.

Sears, Roebuck and Co. Chicago, Ill.

SEED CORN $8.55 A BUSHEL

The Carroll County Missouri Farm Bureau held its first annual seed corn sale in the courthouse at Carrollton. Saturday, January 29. The day proved a very bad one and the roads were practically impassable, but in spite of this the courthouse was filled with people and great interest was taken in the sale. Mr. Sam Jordan, of the State Board of Agriculture, a corn expert of national reputation, gave an address preceding the sale, which was very much appreciated by the farmers present.

Immediately following Mr. Jordan's address the sale was held in the basement of the courthouse and the average price paid was $8.55 per bushel. The highest price paid for a single bushel was $125. This was a bushel of Reid's Yellow Dent exhibited by Horace G. Windsor, who is president of the State Corn Breeders Association. A sample of ten ears by the same exhibtor sold for $26, all going to the same party. Another half bushel lot sold for twenty-six dollars. The discrimination by the farmers was very pronounced when three bushel of ordinary crib selected corn sold for only eighty cents per bushel. The corn was all purchased by Carroll County farmers. Plans have already been started for growing a large acreage of corn this year in co-operation with the Farm Bureau for the purpose of establishing a few varieties of corn best suited to Carroll County conditions. Contributor.

A Handy Little Book

Elsewhere in this issue the Keystone Wire Co. is offering to send free a little booklet called Ropp's New Calculator. It contains a lot of valuable farm information and is free.

SHORTHORN CATTLE

W. C. Prewitt & Sons, Clarksville, Mo., April 27.

JACKS

C. H. Early & Sons, Centralia, Mo., February 18.

Early's Jack Sale

Our readers are reminded that C. H. Early and Son, will sell 18 head of mammoth black jacks at their farm adjoining Centralia, Friday, February 18th. This sale will afford a splendid opportunity for our readers to secure good values. Messrs. Early are recognized stockmen and the quality of their stock has long been conceded. Other business matters necessitates the closing out of their live stock and this sale is an absolute dispersion—everything goes for what it will bring. Every one of the jacks offered is a good proposition. They will run in age from four to seven years old, stand 14.2 to 15.3 and will weigh from 900 to 1100. All are jet black with mealy markings and are the heavy-boned good kind. Messrs. Early will also sell about 35 head of horses and mules and around 25 head of high grade Shorthorn cattle.

Smith Bros. Durocs

In a recent letter from Smith Bros., Thompson, Mo., who advertise Durocs in this paper, they have the following to say in regard to the stuff now offered for sale:

"In regard to our Durocs will say we are offering one yearling by Beauty's Model, which is good, and a string of spring gilts by our first prize boars, Col. Bob and Beauty's Model, and the grand champions S. & C's Valley Chief and Instructor. These gilts are all growthy with quality and are of the big type. These sows and gilts are all bred to Pal's Fancy Advancer, one of the most aristocratic bred boars in the West. Since we have been breding Durocs we have shown three senior yearling boars and all of them have won first at a state show, and we think Pal's Fancy Advancer a better boar than any of them and we are building our hopes on him winning next year as he will be weighing around the 1000 pound mark with as much quality as any of the big ones.

"We are now prepared to sell the best lot of fall pigs we ever offered. They are sired by Beauty's Model and out of sows by Col. Bob. They are the big boned, stretchy kind, deep, broad backed and heavy hams. There is one out of Crimson Lucy by Col. Bob, second dam by Crimson Wonder 3rd, that is a strong herd boar prospect, in fact, he is the best pig we ever owned at the age. When one considers that we raised Beauty's Model and his record this means something."

Write Messrs. Smith for prices, mentioning this paper.

Need a Hereford Bull?

If so, we would suggest that you write Rutter Bros. R 2, Madison, Mo. Their advertisement appears elsewhere in this paper.

Brown's Angus Bargains

K. H. Brown, Bolivar, Mo., in sending in copy for change of add, says:

"I have sold all my Angus bulls except one calf. Also am sold out of Poland Chinas. I now offer a few very fine yearling heifers that I have priced to sell."

Mr. Brown is producing a useful type of cattle and that he pleases his customers is proven by the many letters he receives from those he sells to. Mention this paper.

Linhardt's Polands

Notice the change in the advertisement of H. O. Linhardt, Lohman, Mo., who advertises Poland Chinas. Mr. Linhardt is now offering some splendid values in bred gilts and fall boars—all of the most approved lines of breeding. Mr. Linhardt has shipped his hogs to 26 states and numbers every customer as a satisfied buyer. We know of no better values being offered by any breeder. When writing please mention this paper.

Adenhill Durocs

R. L. Hill, Columbia, Mo., writes as follows concerning the Durocs gilts he now offers:

"I have now four big yearling gilts to offer, all sired by Columbus, he by Waveland Col., by High Chief by Ohio Chief. Three of these gilts were farrowed on September 1, 1914, and are out of a sow by Golden Rule, and the other gilt is out of a sow by Red Royal, he by Helen's Chief and he by Ohio Chief. Red Royal is a full brother to Edna Browning. This latter gilt was bred to Col. Wonder II on December 10th. The other three were bred to a son of Commander Chief on Oct. 26th and Dec. 7th, and one to Col. Wonder II on Dec. 10th. All are showing safe in pig, and should go to good hands. They are priced decidedly low and will prove a profitable investment to anybody. At the price at which they are being quoted they will prove profitable to use their offspring as stock hogs. We also have a good lot of spring gilts bred for spring farrow and their quality, breeding, price, etc., are attractive. We have fall pigs both boars and gilts. This is the season to buy a fall boar, for at this time he can be bought cheapest, and shipping expense is the least. These boars will be ready to use on sows and gilts for fall litters."

When you write Mr. Hill please mention this paper.

Taylor's Sale Great for the Buyer

The second annual sale of Duroc sows and gilts held by Chas. L. Taylor, at his farm near Olean, Mo., Friday, January 21, proved to be a bonanza for the buyers who attended. The average of $42 does not in any way indicate the quality of the offering, indeed, an average of $75 or $80 would have been nearer the real value. When a breeder demonstrates time and again that the type of hogs he is producing are the right kind by going out on the show circuit meeting all comers and taking their measure, it would seem that his efforts should be appreciated. Another thing we want to say here concerns the support, or rather the lack of support, Missouri breeders are giving each other. Just so long as they continue to stay away—or if they do go to a sale it is usually one outside the state, just so long as they continue to do this, they can look for low averages on the Missouri sales. What is it that makes it possible for Iowa breeders to get more money for their hogs? Usually it is because Missouri men have passed up good sales in their own state to attend these Northern sales and thereby raise the average.

We will be glad when Missouri hog men come to realize that Missouri hogs are as good as can be found. Mr. Taylor is to be admired for his nerve and gameness and we trust that in the future when he gets together as high class offering as he had this year that it will be appreciated. The buyers were:

Unsell's Duroc Sale a Success

Dr. J. B. Unsell's first public sale of Durocs from his Clover Leaf herd, Wednesday, January 19th resulted in a very satisfactory average of $42.25.

Dr. Unsell was particularly fortunate in the active support given the offering by his neighbors, who at all times were persistent bidders. The top price of the sale was $108, that price being paid by E. E. De Leishmett, Monroe City, Mo., for the good sow Wilda Duchess Forrest. W. G. Tinsley, Louisiana, paid $100 for J. B.'s Model Queen.

Much interest was manifested among the visitors about the boar, World's Fair Col., recently added to the herd at a long price. This boar will be featured in the herd from now on and next fall the public will be given an opportunity to buy his get. Col. Iglehart had charge of the sale and much credit is due him for the success of the sale. The list of buyers follows:

Bridges Bros. Polands Average $62.25.

The first public sale of Poland chinas held by Bridges Bros., Slater, Mo., February 11th, resulted in the splendid average of $62.25 on the 38 head sold.

It has been a long time since a more representative crowd of breeders and farmers attended a Missouri sale. The Bridges herd has been watched closely because of the extreme care used in founding it—breeders knew that this firm should have a very superior offering, and they were in no way disappointed. Extreme size and quality were the contributing factors that made this sale one of the snappiest and most satisfactory of the present season. When Col. R. L. Harriman opened the sale and called for the first bid no less than a dozen bidders responded and from them on the bids came thick and fast. The top of the sale was set at $170 when Walter W. Head, of St. Joseph, Mo., secured the splendid yearling daughter of Wedd's Long King. Fred B. Caldwell, Howard, Kan., was one of the strongest bidders on the better sorts and secured the second high priced lot by paying $150 for the March 21st daughter of Big Bob, No. 34. The same buyer also paid $147.50 for the spring gilt No. 22. Bennett Bros., Lee's Summit, Mo., got an outstanding spring gilt in No. 26, a daughter of Big Bob Wonder, for which they paid $107.50. G. E. Petty, Versailles, Mo., paid $100 for a yearling gilt by Sterling Prince. M. H. Hibbard, Aullville, Mo., got the good yearling gilt by Long King's Model for $105. S. L. Leonard, St. Joseph, Mo., paid $90 for a spring gilt by Longview's Master Orphan. U. S. Byrne, Saxon, Mo., got splendid value at $98 in a yearling by King John.

Messrs. Bridges are to be congratulated upon the splendid offering they prepared for sale and the satisfactory average of $62.25 is evidence of the high regard their fellow breeders entertain for them. The list of buyers follow:

Baldwin Offers Good Poland China Bargains

R. F. Baldwin, Rocheport, Mo., offers the readers of this paper a desirable lot of bred sows and gilts of strictly big type Poland China breeding. Mr. Baldwin has exercised care in establishing and maintaining his herd and the stock he now offers is such as will appeal to our readers who are in the market for good useful Polands that are capable of going out on the farms of Missouri and making good. The prices asked are extremely reasonable and we would suggest that those interested write Mr. Baldwin without delay. Mention this paper.

Smith's Jerseys

J. B. Smith, Platte City, Mo., who advertises Jersey cattle in this paper is prepared to take care of the wants of any of our readers who are planning to buy a bull or cows or heifers. Mr. Smith has been before the public in the capacity of a breeder for years and has an established reputation for quality of his herd.

I'LL PUT YOUR STOCK

in a thriving condition, make the ailing ones healthy and expel the worms.

DR. GILBERT HESS
Doctor of Veterinary Science
Doctor of Medicine

If you have a sick or injured animal write me at once, giving symptoms, and I will send you prescription and letter of advice free of charge. Send 2c stamp for reply.

Why Pay the Peddler Twice My Price?

I urge every farmer to see to it right now that his work horses are put in condition for the hard work of spring and summer, so that when the sun shines your horses will be rid of their old coats, full of stamina and ready for business.

And don't overlook the spring pig crop—the mortgage lifters. Start them off free from disease—free from worms.

Be sure, also, that your milk cows are thoroughly conditioned for the long, heavy milking season, and that those with calf are vigorous and fit.

Remember, your stock have been cooped up for the last few months and have been on dry feed. As corn or oats, hay and fodder do not contain the laxatives and tonics so abundantly supplied in grass, your stock are pretty apt to be out of fix. Some of your animals are liable to be constipated, rough in hair, their legs may have become stocked, or they have dropsical swellings, but the most common disease of all, especially among hogs, is worms—worms.

DR. HESS STOCK TONIC

25-lb. Pail, $1.60. 100-lb. Sack, $5.00

Highly Concentrated, as the Small Dose Quantity Proves

Now, as a worm expeller, I will go the limit in guaranteeing my Stock Tonic. To clean out your hogs, put in the swill one tablespoonful of my Tonic to every two hogs twice a day and you'll make short work of the worms. Dr. Hess Stock Tonic is

A Sure Worm Expeller
A SPLENDID TONIC

This preparation of mine is 24 years old, farmers everywhere have tested it. I feed it to my own stock, for I know that it contains the necessary ingredients for enriching the blood, improving the digestion and assimilation, keeping the entire animal system clean and well regulated.

Now here is my guarantee to you—a guarantee that my dealer in your town will back up in letter and spirit; it must surely convince you of the undoubted faith I have in this preparation—read it very carefully:

So sure am I that Dr. Hess Stock Tonic will put your animals in a thriving condition, make the ailing ones healthy and expel the worms, that I have authorized my dealer in your town to supply you with enough for your stock, and if it does not do as I claim, return the empty packages and my dealer will refund your money.

And here are my prices—just half what the peddler charges: 25-lb. pail, $1.60; 100-lb. sack, $5.00. Smaller packages as low as 50c (except in Canada and the far West and the South). Sold only by dependable dealers who are known for square dealing.

I have a book about Dr. Hess Stock Tonic that you may have for the asking.

DR. HESS & CLARK, Ashland, Ohio

Remember, I have no peddler's wagon and horses expenses to pay; that's why I can sell you my Stock Tonic through a local dealer in your town—a man with whom you trade every week—at rock-bottom prices.

This 25-lb. Pail, $1.60

Dr. Hess Poultry Pan-a-ce-a

This is just the time you should be giving your poultry this splendid tonic. It will put them in fine condition, make your hens lay, ensure fertile hatching eggs and strong, vigorous chicks. Very economical—a penny's worth is enough for 30 fowl per day. Sold only by reliable dealers—1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail, $2.50 (except in Canada and the far West). Guaranteed.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks, or, if kept in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy, sifting-top cans. 1 lb. 25c; 3 lbs. 60c (except in Canada and the far West). I guarantee it.

Those finding it necessary to buy implements and other articles advertised in THE MISSOURI FARMER will find it profitable to write for descriptive matter so that the comparative merits of the different articles may be studied. These articles are usually found in the stores of the best dealers but if you are posted you can use your own judgment in making your selection. We carry advertisements from none but what we believe to be reliable and trustworthy firms who will deal honorably with our readers.

BETTER FARMING BETTER FARM HOMES BETTER CITIZENSHIP

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

The "Old Man"

Somehow I have never been able to listen to the doggerel sentiment of the song, "Everybody Works but Father," without feeling a degree of resentment against the levity which brought it into being. I know one should not take such things too seriously and yet just the same there is in it the encouragement of a disrespect which is a full grown brother to that other disrespect which, even on the lips of youths, refers to the chief burden bearer of the family as the "Old Man," etc. Thanks to that splendid sense of chivalry which has marked the manhood of our country from its very beginning, the public would not for one moment tolerate such a song directed against our mothers, sisters or sweethearts—but because the shoulders of Father are broad and because he goes on his way uncomplainingly we pelt him with song and jest, and good old soldier that he is, he smiles and apparently never minds. And yet, after all, he is but human—and who shall say that there are not moments when his heart cries out against the cruelty of it all?

I think God made the cliffs and the oak and man at about the same time—and to each he gave the strength to contend against the storm. When there is a wilderness to conquer or wild beasts to slay it is the man's task. When a Nation is in danger or when a great human principle is involved he drops his axe or unhitches from his plow and without a word of protest lays down his life upon a red field of battle in order that the little ones back home and the mothers of the present and future may reap the greater security which his valor buys. As the great wounded Titanic listed on the black sea that night several years ago, men rich in this world's goods stood with bared heads and went to their watery graves with a smile in order that the peasant women and their little children from the steerage might pass on to safety in the life boats—and so, though on occasion he may swear and fight and brawl and be encumbered with a thousand faults, the fact remains that men live and toil and die in order that the "tender ones" may be sheltered as much as possible against the world's harshness.

And, even so, though his path may lie along the peaceful lanes of life, nevertheless he is a brother to the ox and often, long before he has reached his alloted three score and ten, his shoulders stoop under the heavy burdens which time and fate have placed upon them. As I write these words there comes to my mind the picture of thousands of farm homes in which The Missouri Farmer is a constant visitor. I see the father come in from a hard day's work and sit down with his little family to the evening meal—tired and yet cheerful. After the supper dishes have been cleared away I hear him laugh and jest with the little ones or perhaps help them in preparing the next day's lessons—and, finally, when they come to him in their little "nighties," I see him kiss them goodnight and then urge the tired mother to go to bed also—and when all is still and hushed I see him sitting there alone in the old rocking chair pondering over and over again in his weary mind just how he will meet the next interest period or how to solve some other vexing problem—keeping these burdens to himself in order to shield his helpmate, who, the good Lord knows, has troubles enough of her own. From the time he dressed in the skins of wild beasts and lived in a cave down to this hour man has been willing to give up his life for his loved ones—and so, without treason to woman, without whose love, smiles, tears and kisses the world would be as dreary as the desert, I utter this mild protest on behalf of the "Old Man"—for he is God's master slave—a tamer of the wilderness—a conqueror who fears neither the mountains nor the mad seas—a magician who plays with the lightning—who breathes beauty and poetry into stone and bronze—who says and writes immortal things and who makes of himself and of his kind the cobblestones over which the crunching engines of civilization take their way.

A MISSOURIAN IN TEXAS

To The Missouri Farmer:

I am always pleased with most things I see in The Missouri Farmer. I am especially pleased with your efforts to get our people to work together—to do team work. I don't suppose I have to tell you that your article "Wanted—A Thousand Fighting Farmers", appeals to me immensely. I am with you heart and soul. I believe you are right when you say that organization is our only hope. I hope you will get many organizations formed and so trained that they will stick.

I wish The Missouri Farmer could be in the home of every farmer in the state, I have little hopes of that being so this year but I have longed to see what effect it would have upon a neighborhood if they all took The Missouri Farmer and so I am enclosing $10 and request that you send the paper for one year to the enclosed list of names.

If any of those are now getting the paper let me know and I will substitute other names. I wish you would keep track of this list and let me know how many of them renew at the end of their year.

I wish for you a prosperous year and that The Missouri Farmer may lead the farmers of that good old state to cooperation and success.

A Missourian in Texas.

Now friends isn't that fine? That is loyalty to the cause that makes us feel good under many difficulties. Just think what it would mean, not to us as individuals, but to the cause of "better farming, better farm homes, better citizenship" if we had ten thousand loyal friends like "A Missourian in Texas," who would each send in ten new subscribers we would have including our present list more than one-half of all the farmers in the state and what a power they would be joined in one great cooperative body. While we appreciate the liberality—yes the magnaminity of A Missourian's kindness we think it would give us a better fighting organization if our readers would urge their neighbors to subscribe for The Missouri Farmer themselves and get them to see that every progressive, intelligent farmer has an interest in the fight we are and have been making.

It would be just as plausible to talk about winning the great battles of the European war without good generalship as it is to expect the farmers to hold their own and get what is justly theirs without having a thoroughly sound, honest and able publication to defend their cause.

Again farmers should be able to see the difference between a paper published solely in the farmer's interest, devoted entirely to his welfare and those publications distributed for no higher purpose than the dollars gained. We surely are more than thankful to those who have seen this difference.

KEEP THE WORK MOVING

The Missouri Farmer:

I have just finished reading the issue of February 1 of The Missouri Farmer and I want to say 'you hit the mark." You actually knocked center. I have read your paper for several years and let me say sincerely that I think you have done and are doing more for the farmers of Missouri than any other paper printed. In your splendid articles on "Farm Clubs" you have often said, "this means you" and I would say in my own mind "Yes this means me" and at last when my guilty conscience could not stand it any longer I braced up and went to work and in a few weeks had helped to organize two farm clubs in my section, one with twenty members and the other with twenty-six. I think we will soon have three or four more in the county within a few days.

The fire is spreading and I think I can safely say that Washington County will be ready for a County Farmers' Association within a few months. I am also doing all I can for the Market Club. Now, don't slow up on the farm club enthusiasm for it is essential to keep that moving. Really the best time for farmers to get out is during the Spring and Summer months as the weather and roads are then more favorable. I think surely farmers can afford to quit work a little early one day in the week in order to go to their farm club and have a little social enjoyment with their neighbors as well as to consult about business matters of mutual benefit. Now, as I am only a farmer of moderate ability and influence I am sure most any other reader of The Missouri Farmer can do as much as I have done if he will only get busy. If you will wake up and get to work there is no telling what you can do. Keep the organization of Farm Clubs moving for this is the only practicable plan that has ever been offered for a successful farmers' organization.

Get the farmers into clubs first then we will have no trouble to organize a State Association and find a place for "Headquarters."

A T. Dickey, Peoria. Mo.

(Copyright 1915 by The Monitor Stove & Range Co.)

When you fit your house with the Caloric pipeless Furnace. It fits immediately under the floor and the warmed air from its single register circulates through the entire house.

You can install this furnace almost as easily as a stove and you do not have your cellar littered with a labyrinth of pipes. There being no pipes in the cellar this is the one furnace that will not spoil produce. The

(Patented) PIPELESS CALORIC FURNACE (Patented)

is designed on new principles and has desirable features that cannot be found elsewhere. It is guaranteed to save 35 per cent of your fuel. This great saving is effected by means of our ribbed firepot, and the fact that there are no pipes running through the house and cellar to waste heat. The ribs admit free air circulation which causes the coal to burn thoroughly. No clinkers to lose you money. These ribs prevent ashes from forming on the firepot and retarding heat radiation. The Caloric firepot has 600 square inches greater radiation than the average firepot.

Install It Easily in Any House--Old or New

Nothing to do but cut one hole for a register. By digging a small pit you can even put the Caloric Pipeless Furnace in a house that has no cellar. It will burn coal, coke or wood. Bring city comforts to farm homes. Saves the labor of carrying fuel upstairs and ashes downstairs. The Caloric Pipeless Furnace lessens fire danger to house and children. It provides a healthful uniform heat for every room in the house.

Our Strong Guarantee

to prove our confidence. If the Caloric Pipeless Furnace is not entirely satisfactory we'll make it so any time within one year. If there is no dealer in your town to demonstrate this furnace write us for illustrated catalog.

Looks To The Missouri Farmer For Help

To The Missouri Farmer:

Find enclosed a dollar for my subscription to The Missouri Farmer and I wish to express my appreciation of what you are doing to make the paper a source of real valuable information and benefit to farmers. I am sure we all need a great deal of light and help as well as encouragement to get out of the beaten path so long followed.

I endorse the stand you have taken on the Gardner Land Bank and also your efforts to get the farmers working together in cooperation in buying and selling for there is certainly a crying need for getting the producer and consumer closer together and I hope and believe The Missouri Farmer will be the medium through which this will be brought about.

D. W. Scott, Rosedale, Kan.

Says "We're On The Right Track."

To The Missouri Farmer:

I see by the credit on the address tag on my paper that I am behind on subscription. Please pardon me for delay for I should have been very sorry if you had stopped the paper as I do not want to miss an issue.

You are surely on the right track in working for the cooperation of farmers as that is surely the only way for us to get our rights and to maintain them. Enclose find the dollar for proper credit.

W. D. Walkup, Green Ridge, Mo.

No Other Tractors and Plows Have Met Such Tests

AVERY Tractors and Plows have met the test of actual field use in the hands of owners so successfully that there are more acres plowed by Avery Outfits than by any other make. They have also met the test of competitive contests. Have been entered in every important demonstration ever held. Also met the hardest test of all—introduced by a sold-on-approval policy.

Learn All the Facts About the Avery Outfits

Sliding frame; two-speed gears; double drive; slow-speed special tractor motor, extra large crankshaft, renewable inner cylinder walls; no pumps or fan. Another big advantage in getting an Avery Outfit is that the entire outfit is built by one company—the plow as well as the tractor. You can also get a "Yellow Fellow—Grain Saver" Separator in sizes to fit each size tractor. Built in sizes to make Tractor Farming successful on any size farm—large, medium or small. Also best power for threshing and road building. 3-plow tractor, $760, cash; 4-plow, $1120, cash; 5-plow, $1680; 6-plow, $2145; 8-10-plow, $2475. We also build a special smaller size tractor for $295. All built and backed by a company having a large factory and many branch houses which insure prompt and permanent service. The Missouri Farmer

'OLUME VIII MARCH 1, 1916 NUMBER 5

What We Have At Stake

By William Hirth, Publisher

That we are standing upon the thres-ld of the greatest awakening among rmers the country has ever known, becoming more apparent every day. the National Live Stock Growers ss'n Convention which met at ElPaso, xas several weeks ago, ranchmen and eeders present from all sections of the est pledged themselves to a "war nd" of $250,000 with which to con-ct an investigation of present live ock market conditons—and before e convention adjourned, $56,000 was ised in cash as a "starter". That is looks like business requires no mment. A movement to build a ten illion dollar co-operative packing ant at Ft. Worth, Texas—an enter-ise to be financed by the Texas cattle-en—is also under serious considera-n at this time and from present pros-cts will be definitely launched in the ar future. The recent convention the Kansas Live Stock Ass'n at ichita was attended by nearly 2000 eders and was full of fight from the ment the gavel fell until it ad-rned. In Missouri the aggressive ht conducted by The Missouri Farm- has led to the formation of hun-eds of farm clubs and the movement s only gotten fairly well started. It uld fill this issue from cover to cov- if we were to print all the enthus-tic letters we have received from e President and Secretaries of these w organizations during the last 30 ys—and every mail brings word from w clubs which have just been nched. Of course this work is new farmers and it will take some time to t these clubs on a substantial basis— t a little patience and perseverance ll win out and from the present out-k the time is not far off when the gressive, thinking farmers of Mis-uri will be banded together as never fore and that far reaching results ll follow there is little question.

Organization The Only Hope

We believe we speak for the high nded farmers of this state when we y that back of the present movement merely a wholesome demand for a quare deal"—for a change in condi-ns which are becoming more and ore unbearable and which are strik-g a deadly paralysis into farm life om one end of the country to the her. The prosperity of the Nation is unded upon Agriculture an a state of fairs which robs the farmer of the st fruits of his toil cannot fail to ally undermine all our other indus-es. Society has no more right to k a farmer who employs modern ethods in his farmng operations to ll his products at a loss than it has to k a manufacturer of shoes or farm plements to sell those things at a loss and because for years the farmer has en compelled to do this is the answer the rapid increase in farm mort-ges and land tenancy. That in the ac-mplishment of these ends we must ake ourselves loose from the grip of monopoly and that we must greatly shorten the route from producer to consumer—this is the task before us in a nut shell and only through powerful statewide and finally Nation-wide organization can we expect to accomplish this end.

The Issues Involved

In former articles we have said that the freedom of American Agriculture and the well-being of the farmer's children in the years to come are involved in this issue—and this is true. A "square deal" for the farm also means that thousands of intelligent hard working farmers who now view the future with a sinking heart will be able to once more see daylight ahead—that they will once more have the assurance that intelligent and thrifty effort will enable them to lift the mortgage which now hangs like a dark pall over their homes. We say "intelligent and thrifty effort" because we want to make a sharp distinction between the real thinking farmer who applies the best thought to his work and the shiftless one who trusts everything to luck and merely drifts with the current. Such a farmer is not entitled to anything better than his present lot nor should it be the object of any system of farm organization to help the fellow who isn't trying to help himself— for that would mean placing a premium upon incompetency.

But there are other great and vital things involved in the present struggle. The farmer is being continually scolded because he has not built better public highways—and we freely confess that the average country road is a disgrace to its community, a tax upon efficient Agriculture and a thing which contributes tremendously to the isolation of thousands of country homes in that it bars them from active contact with the outer world during a great portion of the average year. But, after all, it takes money to build good roads and when the average farmer realizes that he is playing a losing game—when frequently he is unable to pay the interest on his mortgage—under such circumstances can you blame him so very much when he doesn't enthuse over an issue of road bonds? A few days ago the Supreme Court of the U. S. upheld the legality of the Special Benefit District road law which in our judgment is the best law of the kind ever passed in this or any other state—and yet splendid as it is, the farmer who has recently lost $90 on a bunch of hogs or $200 or $300 on fat cattle doesn't view any expenditure, however, much needed, through the eyes of an optimist. Put the farms of this state upon a prosperous basis and our farmers will vote good roads bonds by the million nor will they need to be prodded by a sharp stick from other quarters.

Better Rural Schools

Likewise, we are told that the present rural school falls far short from fulfilling its true mission and again we grant that the criticism is generously deserved. No other American institution has progressed less during the last 25 years than has the rural school. In fact, when the immaturity of hundreds of rural teachers and the poor school equipment is considered it is an open question as to whether we have not gone backward rather than forward. That the fundamentals of Agriculture should not long since have been taught in our country schools and that the facilities for the ordinary high school courses should not have been placed within the reach of country boys and girls as well as those who live in town—all these things are self evident to any thinking farmer. And yet, mature teachers cannot be hired for $40 or $50 per month for eight months in the year and it costs money to consolidate districts and build rural high schools. So we again say if you will put our farms upon a money making basis these ends, so much to be desired for the future of the country boy and girl will be vastly easier of accomplishment. In short the future welfare not only of the individual farmer but of rural life itself depends upon rescuing our farms from those influences which have been sapping out their very life blood during recent years. A man may start into any undertaking a pronounced optimist, but if he is compelled to keep on playing a losing game it is only a matter of time until he will come to view things through smoked glasses. So it may be said in truth that the success of this great new movement among farmers will mean the dawn of a new life upon the farm—a new era in which we will be able to solve without hardship the many serious problems which confront us at this time.

What Can We Do?

Almost the first question which the Secretary of every new farm club asks us is, "What can our club do, now that we have organized?"—and while we have tried to point out these things in a half dozen articles during the present winter, yet we will once more set them forth in brief form in order that this article may serve as an answer for sometime to come to this question. In the first place the only way farmers can hope to throw off the yoke which galls them at this time is through organization. So long as each farmer acts for himself things are certain to go from bad to worse. The first thing is to perfect a school district farm club and when 15 or 20 of such clubs have been formed you will be in position to perfect a county association with a President, Secretary and a strong board of directors reaching into every part of the county. This accomplished, the work of organizing the unorganized districts can be taken in hand. When 25 or 30 counties have organized in this way, we will be in position to form a state organization—and then we will be able for the first time to take in hand the solution of the larger problems which concern us. But the beginning point must be in the school district. It is a problem which can only be solved by beginning at the bottom and so long therefore as you and your neighbors remain indifferent you are blocking the success of the movement so far as your community is concerned—and the sooner this fact is realized—the sooner it dawns upon every farmer that he has a positive part to play, the sooner we will begin getting somewhere. If we fail in the great work we have undertaken it will not be because we lack the power to break the chains that bind us. On the contrary, the only thing which can defeat us is the indifferent, "I don't believe it can be done" attitude of farmers themselves.

As to Immediate Results

While we should never lose sight of the larger things we have in view, yet there are a lot of things which your school district farm club can take in hand which will mean the saving of hundreds of dollars to your members during the year. Through our Farmers Market Club, as was pointed out in a recent issue, we will be able to

PAYING THE FIDDLER

During the last few weeks, wheat has been taking one tumble after another—the present price being far below that of a year ago and yet, despite the slightly larger yield of last year, Europe is still in the thick of its great tragedy and unquestionably the demand from that quarter is as great as ever. Surely there is no justification of the prices of today as against those of a year ago—and thus, what the floods didn't destroy the market manipulators are now buying at their own price.

How much longer will the farmers of the United States stand for these impossible conditions? Does any sane man believe for one moment that foreign governments are buying American wheat on the basis of what the American farmer is compelled to accept for it? How much longer will we permit a group of speculators to dominate our grain markets? What's the use of toiling the whole year round and then permitting a few men to say what they are willing to pay for the fruits of our labor? Do you think the grain gamblers could keep on doing this if the farmers of the United States were organized?

procure for your members wholesale prices on car load shipments of bran, shipstuff, oats, hay, coal, fertilizers and other like commodities direct from the big mills, wholesale feed concerns and mines. Just think of what a saving wholesale feed prices would have affected to the farmers in the average neighborhood during the drouth years of 1913-1914? And who knows when the same conditions may prevail again? Orders for binding twine should be made up as early as possible in order that the twine plant at Jefferson City may know what the demand will be—and twine bought at the Penitentiary will affect quite a saving for your members. While the saving on car load shipments of fertilizers is not as large as we think it should be, yet it will mean the saving of the agents commissions—and this is worth while. We are at the present time trying to perfect arrangements with several wholesale wool concerns to buy wool direct from farm clubs and hope to be able to announce an arrangement in the near future which will mean much better prices than those paid by the small local dealers. That the above things alone fully justify the existence of your school district farm club should be apparent.

Better Farming Questions

Then there is the fight for the Land Bank Bill which should be organized in every school district in the state—for without this kind of effort it will be lost. We recently prepared a club discussion on this question which is free for the asking and which will make its provisions plain to all your members. Again, there are the great problems of better farming which should play a big part in your meetings from time to time—for we must never forget that upon the methods employed depends much of the success of every farmer. Once every month the women should be invited in and a social session should be held for if they are given an opportunity they will contribute much toward the success of your organization. As soon as four or five good farm clubs have been organized in your township, a big township mass meeting and picnic should be planned after the rush of spring work is over and the Agricultural College and State Board of Agriculture should be asked to send one or more good speakers. Surely these things furnish ample answer to the question "What can we do?"—and we hope you will get busy and that your Secretary will get in touch with us as soon as your club has held its first meeting. In conclusion, exercise a little patience in the beginning. Rome wasn't built in a day nor can the grave problems we have in hand be solved overnight.

THE RAINY SEASON
CONQUERED BY
THE TOWER SYSTEM
OF
CORN CULTURE

Tower Cultivators went into the fields three days earlier than the shovels after a rain. Earlier maturity of the corn was the result.

Willard Zeller & Sons, Cooper, Iowa, write: "We use Tower Cultivators **all the time**, wet or dry weather, and have made some fine yields of corn. One acre of ground yielded 141 bushels of corn; another 124 bushels; another 139 bushels, winning numerous first and Champion prizes. We believe the Tower method **the only method** of cultivation and will always recommend it to corn growers."

This firm captured the World's Fair prize for **best bushel of corn** at San Francisco the past season. Briggs Bros., Moorehead, Minn. write: "Tower Cultivators give entire satisfaction in every way. Our first prize corn in third district National Corn Show, St. Paul, was tended with the Tower entirely. It hastens maturity not disturbing the root system."

Spares All Corn Roots

These Corn Roots within Five Inches of the Surface.

Each of the following extensive corn farms of Illinois use 25 to 50 Tower Cultivators: Ill. Canning Co. and Hoopeston Canning Co., both of Hoopeston, Ill.; Iroquois Canning Co., Onarga, Ill.; Bloomington Canning Co., Bloomington, Ill.; Chenoa Canning Co., Chenoa, Ill.; LeRoy Canning Co., Leroy, Ill.—because they have proved the best.

Many thousands of farmers of the country use the "Tower" exclusively. Nearly every grower of Seed Corn uses the Tower System because it is proved the best known.

Reader, be sure your Cultivator this season has the name **"TOWER"** on the tongue. Write us for **free** literature.

OPPORTUNITIES IN LIVE STOCK FARMING

The young farmer who will give close attention to the production of most any class of live stock and stay with whatever line of stock raising he may take up until he becomes reasonably proficient in it will stand a much better chance of success than the one who shifts around with the "ups and downs" of the various lines of farming.

It matters not whether a man engages in breeding purebred stock, or in the growing of the ordinary market classes or in the breeding and finishing of animals—in whichever line he may engage he will find his prospects sometimes up and sometimes down but if he stays with one line of work he will know so much more about it that if any one can get a profit out of it he will be the man.

The man who succeeds in any avocation is the one devoted to his work and who has a fixed purpose in what he is endeavoring to do. In choosing a line to follow it is then of great importance to the young man to first study himself. If he has a natural fondness for beef cattle for instance he will find it an uphill fight for him to take up dairying. And if he is a great lover of horses he may find it impossible, or at least difficult, to train himself to give the close attention necessary to raising and fattening hogs. Then we would say to the young man, or anyone thinking of taking up any special line of live stock production, let your own likes and dislikes be a large factor in deciding what to do. I do not mean by this that a man can not by cultivation change his own tastes but simply that for nine men out of ten it is a hard thing for them to do and they will more likely reach success if they chooose something they can put their whole heart into.

In the section of the United States of which Missouri is representative if we take a survey of all farmers we will find that of those men who have made an average success or better, that about four out of five of them have made most of their money out of some branch of live stock production. We think in the next fifty years this will be true even to a greater extent than in the past because of the fact that most of our farms are much worn and the improvement of fertility while cultivating the land is a much harder proposition than farming out the natural plant food which was stored up by the ages before we began to plow the land.

About the first thing a young farmer should do then when selecting a line of live stock farming to follow, after he has studied his own aptitudes, is to study the practices of the men who have succeeded in that particular line. Most any successful man will be generous enough to advise any young man who shows a disposition to want to learn. Briefly we will mention some of the lines that offer enough promise for any farmer in this state who is not already established in a system that is profitable, to take up with good assurance of success. On the farm well adapted to corn growing and alfalfa or red clover there is a good chance to make swine raising the leading business. One favorable feature of choosing the swine industry is that it can be started with small capital. It may be more attractive to ambitious young men to start with good equipment and a considerable herd but if we take the men who have succeeded in the past, will find about nine out of ten who have prospered, had to start in a small way and grow into the business, learning by the hard rule of experience, step by step as they made progress. All over this state may be found men who are making a living and paying for a farm by producing pure bred hogs for sale as breeders. That there is yet room for more men to enter this field is evidenced by the fact that thousands of scrub hogs find the way to our markets every year and so long as tha is true there will be room for th breeder who will adopt intelligen methods of advertising to sell what h raises.

On most farms where hogs ar raised for market the hogs are con sidered as a side line to cattle feedin or dairying but when our Missou farmers come to practicing more high ly specialized methods and learn t grow hogs with less grain and mor forage there is splendid opportunit for "hog farms" to be developed a over this state that will make a profi able business for the owners.

Sheep husbandry is not so promi ing as the principle business on ou higher priced lands but on the cheape lands and on those hill farms now we worn, sheep offer a good chance fo profit. The first great hindrance sheep raising is the menace from dog and from our past experience in tr ing to abate this nuisance by an e fective dog law we think it will be long time before the dog population much reduced. But with woven wi fencing at a reasonable price the do is no longer an insurmountable dif culty. Ohio with higher priced lar than Missouri and only about tw thirds as large has two and a ha times as many sheep as we have ar taken as a whole Ohio agriculture one of the most successful among th best states of the Union. Missou could easily increase the number sheep by ten fold without crowdin and under present conditions ar those likely to continue long after th European war the markets will tak care of all the wool and mutton w can produce at remunerative prices.

Among all the various lines of li stock production we think none offe a better field for a young man at th time than cattle raising. The her of Europe have been greatly deva tated and it is a matter of record th we are short on meat producing an mals in this county, so what is there prevent a reasonable demand for be butter, leather and other cattle pr ducts? One cause of failure on th average farm with cattle raising h been the unnecessary waste allow to go on. It may take more intel gence to raise a good calf with sk mlk than where the calf is permitt to run with the cow but for that ext thought the farmer puts into his bu ness the monthly cream check, whi will afford mighty good pay.

In future articles in The Missou Farmer we will discuss various sp ialized lines of stock raising and e invite articles from any of our read who have made a success or faile trying any particular branch of e industry.

The above cut shows very strikingly what a good brood mare will do in the way of making the farmer money and earning her board. The mare which stands at the left of the picture is an unregistered Percheron, purchased by Mr. L. Hendricks, of Boone County, in 1910. This mare and her mate cost $450, and while doing a good share of the farm work she has produced a colt each year. Mr. Hendricks values the progeny now at $1000. Yet some men say brood mares **don't pay.**

LOOK OUT FOR YOUR SEED CO

It is now but a short time until e music of the corn-planter will e heard in many thousand fields but e can not think there is really mu music from the "click" of the plan r to the man who is just a little t doubtful about the vitality of his sed corn. The man who is ninety-n e per cent sure that his corn will gr when he sees the kernels fall into e furrow of the planter can sleep a t sounder than the fellow who is jus a little bit doubtful as to the kind f seed he is planting.

If there is one thing a man sho d be dead certain about it is that ev y seed he plants will grow if giv n normal heat and moisture. It sho s a loose joint in a man's system f farming for him to prepare his la d well, fertilize it liberally and to exp t

good crop without knowing to a certainty that his seed will grow.

Last fall when the corn was ripening there was a lot of rain and before lot of the corn was thoroughly dry here was a freeze and we hear that a ot of corn that is apparently all right s low in vitality and that means trouble for many farmers unless they take he care to test the seed corn. A few ours work testing seed may save a lot f worry and work replanting as well s make you a bigger crop at gathering time.

VHY NOT GROW MORE CLOVER?

PART II

In our first article on this subject e said we thought possibly the two hief reasons why farmers did not row more clover was because it was ot profitable and because farmers did ot understand how to grow it. That tatement was not exactly what we eant to say. Rather we would say lover growing is not profitable beause farmers do not know enough bout growing it. We also stated in ur previous article that the two rincipal causes for clover failure were our soil and lack of vegetable matter n the soil. As we have already said t will cost very little to find out by rial if your soil needs lime to sweeten and the man who has not had good uccess with clover should not fail to ake this test but he had better not top there for the chances are that is soil if it has been farmed in the sual way for many years will not row clover very successfully without ore vegetable matter in it even hough he should supply the lime with ut supplying the vegetable matter. very man knows the very great difference there is between a soil full of rass roots and plowed-under vegetaion or coarse manure and the wornut, run-together soil found on thouands of our old farms. This wornut land must be put in that new-like ondition before we can be very sure f a stand of clover or before it will o well when a stand is obtained. If hen your soil has been cropped eavily and you have been having rouble in getting a stand of clover ou had better change to one of the nnual legumes, cowpeas, or soybeans, ot permanently, but long enough to et your land in shape to grow clover gain. But whatever your plan is you nust either put on plenty of coarse nanure or plow under vegetation to estore the good physical condition he soil had when new, in fact both of hese will have to be resorted to on nost farms. Any grass, weeds, stubble or corn stalks turned under will elp the land but to get quick returns t is best to turn under crops when reen because of the quicker decay f the stuff plowed down. To do this, owever, and not lose the use of the and for a year is important with nost men who must have some return very year to pay interest and other xpenses and have something left for he family. First by carefully saving he manure, using all the straw and ther waste feed for bedding, and applying the manure to the best advantage with a manure spreader and reinforcing the manure with commercial fertilizer we can get back to clover growing. By applying the manure lightly and using whatever amount of fertilizer may be necessary say 100 to 200 pounds per acre with wheat we will perhaps find little trouble in getting a stand of clover.

By sowing rye in corn in August or September it can be plowed under the next spring in time to plant another crop. In that way considerable green stuff can be put under by the 15th or 20th of May and in plenty of time to grow a crop of cowpeas or soybeans. After these are taken off wheat may be sown and a good fertilizer applied at the rate of 150 to 200 pounds per acre and then clover sown on the wheat in the spring. With a normal season this plan should give a good growth of young clover in the fall after the wheat is harvested and this may be pastured lightly or clipped oncce or twice and let remain on the ground.

Except in very wet seasons when a heavy growth of summer grasses come on with the clover we would not mow and take off the land. Even when a good heavy growth of clover and summer grass is had a good plan is to plow it under in the fall for the green manure but under normal conditions when we were on this building up process we would rather let the clover stand for a second year's growth to get a deeper root growth which is quite valuable. If the land is not in pretty good condition we would turn under one of the crops the second year. If the first crop is needed for hay it may be cut off and then plow under the second. Another plan is to drag down the first crop and cut the second for seed, cutting high enough to leave most of the stalks on the ground to turn under. Every man must work out, first, what plan he will use to suit his own system but the thing to bear in mind is to have something growing all the time which will leave a good stubble and root growth or that will make a good top growth to turn under. If this can be done and at the same time get at least one crop to harvest a year expenses can be met which is important to look after always. I can not understand why more men do not grow clover for the seed crop. A good stand in a normal year should make from 2 to 4 bushels per acre but occasionally a crop will make 6 to 8 bushels and sometimes of course very little is obtained. When the first cutting is taken off early it will often increase the yield of seed to clip the field ten days or two weeks after the first crop is harvested. This of course will depend on getting a normal rainfall through the summer for if the season is very dry more seed will be harvested not to clip it. Seasons that are abnormally wet and produce a very heavy crop do not usually make a good yield of seed.

The harvesting of clover is a very simple matter, the best machine being the old style self-rake reaper. The clover buncher attached to the cutterbar of the mower is also very satisfactory. Sometimes the crop is mown and raked like hay, but this is a rather wasteful method unless the crop is heavy enough to rake clean off the ground.

The seed crop should be cut as soon as the heads are all brown and it may be hulled directly from the field after it has dried ten days or more or it may be stacked and thrashed after cold weather, but great care should be taken in stacking for it is easy to take water unless well covered. The expense of handling a seed crop is not great except the thrashing bill which is usually about one dollar a bushel and when clover sells for $8 or $10 a bushel there is a good profit in it when all other advantages of the crop are considered. Just at this time clover seed is retailing around $12 a bushel and at that price the farmer who has a few bushels to sell feels pretty good over it while the fellow who must buy is apt to neglect to sow it at all. Fortunately for Missouri farmers they can grow a number of legumes profitably, such as clover, alfalfa, cowpeas, soybeans, and vetch, but on most farms and for all purposes we would place red clover at the head of the list.

To Ford Owners

NOW SAVE $5.00

This is your opportunity to gain complete motor satisfaction on every trip—freedom from all those road troubles—without great expense.

No need now for jiggling or shaking. Your Ford will ride like a canoe on a quiet lake when you equip it with

AITCHANDEE

Shock Absorbers

New price $10.00. Formerly $15.00. This reduction is made because of enlarged volume. Yet the quality remains the same. There are numerous improvements in our new model. Over 50,000 farmers have put Aitchandee Shock Absorbers on their Fords—which proves how well men like our invention.

Aitchandee is the original shock absorber using the cantilever principle which gives the long-sought-for, different tension on the downward and upward thrusts.

JOY FOR FORD OWNERS

Aitchandee Shock Absorbers are easily attached. Then begins complete satisfaction. Our cantilever principle removes those side slaps and thrusts when steering over rough roads or at high speed.

"For the life of your car" is our guarantee. Ask your dealer today. Or sent direct on receipt of price on a money-back basis.

Aitchandee Shock Absorbers are the cheapest good *shock* absorbers you can buy. Don't wait any longer.

Have You a Spraying Outfit?

Why not spray your orchard this time and raise a crop of apples that will command the best price next fall? You couldn't possibly make a better investment and if you will write the Hays Pump & Planter Co., at Galva, Ills., they will send you complete information and prices. Mention this paper.

Manure Spreaders Pay

Look up the manure spreader adds in this issue for this is an implement which should be found on every good farm and one which will pay for itself the first season. Write for complete information. A postal card will bri it and it may tell you some things you don't know. Please mention this paper.

Why Pay War Prices for Nitrate of Soda Fertilizer? Legume Crops Inoculated with

THE STANDARD INOCULATION

FARMOGERM

High Bred Nitrogen-Gathering Bacteria for Clover, Alfalfa, Beans and Other Legumes will add the free Nitrogen in the air to your soil at the rate of $40 per acre at a cost of only $2.

Nitrate of Soda is now $80 a ton, a prohibitive price for the farmer.

You can inoculate 5 acres of Peas, Beans, or other legumes with FARMOGERM for $6. That means 5,000 lbs. of Nitrate Nitrogen going to enrich your soil. Bought as Nitrate of Soda it would cost $200.

And in addition to all this FARMOGERM produces best and biggest crops of Peas, Beans, Alfalfa, Clover and all legumes, at lowest cost.

100 acres (in 5 acre size bottles).. 100

Warm the house —make a home!

Women like radiator heating—it puts June in every room

All mothers wish for homes that are evenly warmed all over to cheer and comfort husband and little folks; and to make the home a cozy, genial center for the gatherings of good friends.

All mothers now-a-days deserve to be freed forever from the back-breaking labor of "tending stoves," that heat only "in spots," and spout ash-dust and coal-gases. The only sure way to fill a house with mild, delightful warmth and make it a home is with an IDEAL-AMERICAN outfit.

AMERICAN RADIATORS & IDEAL BOILERS

They increase the value of your property by more than their cost. They are noiseless, absolutely safe (a child can run them), and can at any time be put in new or *old* houses without disturbing anything or tearing out walls or partitions.

***They protect against fire risk* and run independently of the water works supply, as same water is used over and over again for years.**

They pay for themselves in savings

The IDEAL Boiler may be put in cellar, side-room or "lean-to" and will burn any local fuel—wood, oil, gas, lignite, hard or soft coal, (even cheap grades of pea coal, slack, run-of-mine, screenings, etc.) Bankers and real estate men will back our statement that it is a paying and permanent investment and not an expense.

IDEAL-AMERICAN outfits heat the whole house, with one fire—no more care-taking than to run one stove for one room. The yearly fuel savings soon pay the first cost of the outfit.

A No. 020 IDEAL Boiler and 262 ft. of 38-in. AMERICAN Radiators, costing the owner $185 were used to heat this farm house, at which price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions. The IDEAL outfit is the *only* feature of the house which is never worth *less* than you paid for it.

Let us tell you all about it and give you special information so you can judge for yourself. Write today—now—for free booklet: "Ideal Heating." You will not be asked to to promise or obligate yourself in any way, but send for it at once.

IDEAL Boilers have large fuel pots in which the air and coal gases thoroughly mix as in a modern gas or oil mantle or burner, thus extracting every bit of the heat from the fuel. Easier to run than a stove.

Sold by all dealers. No exclusive agents. AMERICAN RADIATOR COMPANY Write to Dept. F32 Chicago

It's Up to You!

On several occasions during the last two years I have been approached by big publishers and asked whether I would consent to sell The Missouri Farmer—but up to this time I have turned a deaf ear to all such proposals. The time has finally arrived however when either I must have better support from the readers of the paper or consent to let its ownership pass into hands more financially able than myself to assume the heavy burden. All my friends know that I am many thousands of dollars on the wrong side of the ledger at this time—and I feel that the time has come when it is my duty to make a frank statement to the 50,000 farmers who read the paper and who have some degree of interest in the situation. I would rather be the owner and publisher of a great farm paper in this great state than to do anything else in the world. I was raised on a Missouri farm and my heart is in this work. I believe that the future of our great Country depends more upon a "square deal" for the farmer than upon all other things combined and hence, although I have thus far made tremendous sacrifices it has nevertheless been a labor of love and should I have to part with the ownership of the paper it will leave a wound in my heart which time with all its healing powers will never be able to efface.

I think I can truthfully say that no other farm paper in the country has made a more fearless fight for the best interests of the farmers of this state than has The Missouri Farmer—and if all those who read it think enough of it to send us a dollar on subscription it will enable me to continue the fight and also to make the paper much stronger and better than ever before. With 50,000 stalwart Missouri farmers back of me, The Missouri Farmer can be made the greatest power for good the state has ever known. By this I do not mean that the paper is without thousands of powerful friends at this time. On the contrary, it has more fine, progressive Missouri farmers on its list than any other farm paper ever had in the history of the state—but these men cannot be asked to carry the burden of many others whose support I must have if I am to make a real success of this splendid enterprise. How many other farm papers which come to your table have made as aggressive a fight for farmer organization as has The Missouri Farmer? And is there any other hope for deliverance from the wrongs which surround us at this time? I have said repeatedly during the last few months that the farm is facing the greatest crisis in its history and there isn't a thinking farmer in the country who doesn't realize this fact. But I cannot keep up the fight without the active and hearty support of the farmers of this state—and if the things for which Mr. Ellis and myself are struggling are right, then we are entitled to that support. If, on the other hand, farmers are content with conditions as they are, then the sooner we find it out the better for all concerned.

Many farm papers are run merely fo the money there is in them and not because the owners are vitally interested in the farmers welfare and this is why they drift with the current rather than criticise any interest which may lessen their advertising patronage. If the farm papers of the country had done their duty by the farmers during the last ten years we would not find the pitiful conditions which abound upon every hand today—and the time has come when farmers must choose between farm papers which are not afraid to champion their cause and those which pursue a "speak easy" policy because that policy brings in the most money.

So, whether I shall be able to continue this great fight or not is up to you and your neighbors my friend—and I propose to put the matter to a final test by means of this appeal. To this end, I am going to ask those who have not yet sent us a dollar for three years renewal to do so without further delay. If your dollar reaches us promptly we will cancel all back subscription and date you three years ahead. But this is the last time this offer will be made. Then I am going to ask you to help me make March 20th a "Red Letter" day in the history of The Missouri Farmer. Between now and that day I am going to ask every **real friend** of the paper to see how big a club of subscriptions he can raise among his neighbors—and I hope the result of this appeal may bring to my desk the biggest pile of subscriptions in the history of the paper. If, on March 20th I receive a response which will mean that The Missouri Farmer is not for sale, I can assure you I will be the happiest man in the state.

A dozen members for the "Farmers Market Club" at $1.50 each will enable us to furnish you wholesale prices on car load shipments of bran, ship stuff, oats, coal, flour and fertilizers and save your neighbors hundreds of dollars. Surely there isn't a wide-awake farmer in your school district who will not gladly join in this fine plan with you if you explain it to him? Keep 25c out of each subscription to cover cost of raising the club, etc. You may also retain 25c out of each dollar subscription for three years. If this matter is brought up in the hundreds of farm clubs which have been recently formed I am sure few farmers will refuse to turn in their subscriptions. To the farm club which raises the largest number I will present a handsome American flag with my compliments. But whatever the size of the club you can raise—even though it be only two or three—it will help out tremendously—so I ask you to simply do the best you can and if you need sample copies we will be glad to send them.

But if you don't care to make up a club, **at least send us your own dollar on renewal** for there are enough unpaid subscriptions on our list to put The Missouri Farmer on a financial basis so sound that we will soon be able to give you a publication of which every farmer in the state will have just cause to feel proud. Surely when scores of farmers who have caught the spirit of the fight which The Missuri Farmer is making go down into their pockets for $5 and $10 at a time and offer to pay for the subscriptions of their neighbors while others make up clubs and refuse to keep a single penny for themselves—surely if there are farmers who are willing to do this, every thinking farmer should at least be willing to pay the small pittance of 33⅓ cents per year on his own account for the next three years? Especially do I direct this appeal to our readers in such splendid counties as Nodaway, Saline, Carroll, Ray, Jack-

AN EXTRA SPECIAL PROPOSITION

ON 10,000 NEW GALLOWAY No. 8 SPREADERS FROM *NOW* TILL SEEDING TIME

This extra **offer** is made with the idea of getting **ten or more Genuine Galloway Spreaders** in every township in the **next few weeks!** One Galloway No. 8 always sells from one to a dozen more! I make this new special offer to get **10,000 advertising spreaders distributed quickly,** which will build up an **enormous** amount of summer and fall sales.
I sell on terms **to suit you. Six** different selling plans, including **one year** to pay **installment** plan, **note** settlement, **half cash, half note, bank deposit** or cash, at prices so **low** you cannot afford to do without a manure spreader. **We sell direct,** at **less** than **wholesale,** from **factory to farm** at the **actual** cost of labor, **actual** cost of material and only **one** small profit, based on **tremendous output.**

PRICES LOWER ON SPREADERS NOW

Get in on this **special distribution advertising offer** from **now** until seeding time. At the end of twelve months, if the Galloway Spreader **has not paid for itself,** if you have hauled out a **hundred loads** of manure or more, and it has not proven everything I say for it, I agree to take it back, pay freight both ways and **return your money,** no matter on which plan you buy. Could I make this offer if I was not sure of my ground? Every sale backed by a **$25,000 bank bond**—an **additional guarantee** to you!

FIRST READ THIS

MANURED! I wish you could have seen this field year before last and the poor crop on it! Here is an actual photograph of a corn crop grown in the fall of 1915 after an experiment by using an application of manure. The other photograph shows part of the identical field taken the same day, but that part of the field was **not manured.** The increased crop of corn from this field amounted to over $17 per acre where manured! Figure it out on 20 or 40 acres or **on your own field**

NEW 1916 BOOK FREE

Get this big, new catalog A postal gets it. 250 pages. Printed in four colors. It tells how to handle manure with the least labor—how Galloway made spreaders famous—how a run-out, unproductive farm was turned into a "gold mine" crop producer—how to build a manure pit to preserve fertility—how to increase your corn crop from $10 to $15 per acre—how a Galloway spreader will pay for itself in one year by increasing crop profits and leave money to put in the bank in the fall—how we save you $25 to $45 on a spreader—how Galloway, right from the farm, a few years ago started and built up a $2,000,000 industry by selling direct from factory to farm—how with a 20-lb. steel and malleable feed mechanism we accomplish the same results as others do with 400 pounds of brittle gray iron---how a Galloway spreader handles easier with two horses than other spreaders with three and often four.

New steel beater and wide spreading V-rake pulverizes and tears manure to shreds. Worth $15.00 on any spreader; costs you nothing extra on Galloway. Over 50,000 in use. Invincible, Irresistible patented roller feed. This great exclusive feature on the Galloway Spreader is what makes it superior to all others. It's a secret of our light draft, because the perfect mechanical principle used here is exactly the same principle as moving a house on rollers. This feature alone is worth $25 on any spreader. Exclusive on the Galloway, but costs you nothing extra. Don't buy a spreader of any make or kind until you have tried a genuine Galloway at our risk without obligating yourself before trying.

Patented automatic stop, uniform **clean-out push-board.** Worth $10 on any spreader. Exclusive but costs you nothing extra on the Galloway. Spreaders shipped from Waterloo, Kansas City, Council Bluffs, St. Paul and Chicago.

New everlasting, pressed steel unbreakable tongue, worth $5 more on any spreader. No extra charge on the Galloway.

S-18

30 DAYS FIELD TRIAL AND RETURNABLE TO US WITHIN ONE YEAR IF NOT PERFECTLY SATISFIED

THEN READ THIS

NOT MANURED! This picture was made on the same day as the opposite photograph. It is in the same field but not manured. It had been cropped to death! This field was in exactly the same condition as the other field, planted the same day, cultivated the same way, grown from the same seed, by the same man, but was **not manured.** A Galloway manure spreader will positively pay for itself in one year if you have a hundred loads or more to haul—and leave you money besides! Read our special 1916 proposition in this ad, and the complete story of this experiment in the new 1916 big catalog.

OTHER 1916 FEATURES—IMPROVEMENTS

In addition to our exclusive patented roller feed, automatic stop, uniform clean-out, push-board, the everlasting beater and V-Rake, we have many other valuable features, including pressed steel tongue; double chain direct drive from rear wheels; endless apron with force feed; frame work of channel steel, trussed like a steel bridge; cut under front wheels, short turning; extra light draft; two horses will do with this spreader what it takes three or four to do with other spreaders; seat folds forward out of the way when loading; 60 to 70 bushels capacity but so constructed that manure can be piled 18 to 20 inches above the top of the box and the spreader will successfully handle it.

Remember we manufacture this spreader in **our own factories** and sell it **direct** to you from **factory to farm.** This spreader should **not** be compared or confused with other low-priced spreaders that **do not have** the special exclusive patented features and genuine merit (backed up by tens of thousands of **Galloway** spreader users) that is found in the **Galloway. Beware** of cheap, absolutely worthless imitations of the **genuine Galloway. Beware** of imitations at any price. Get a **genuine Galloway** and you will be **safe.**

WM. GALLOWAY, PRESIDENT, THE WM. GALLOWAY CO.
Manure Spreader Manufacturing Specialists.
GALLOWAY STATION, WATERLOO, IOWA

son, Cooper, Macon, Adair, Shelby, Marion, Monroe, Boone, Audrain, Montgomery, Randolph, Sullivan, Grundy, Caldwell, Howard, Pettis, Henry, Vernon, Cass, Johnson, Jasper, Greene, Dade and the counties in southeast Missouri where we have thousands of readers. What difference does it make whether a bank or group of banks or a Commercial Club originally sent you the paper when we offer to cancel your back subscription and date you three years ahead? The question is whether you are with us in the fight we are making for a "square deal" for the farmer. That is the whole thing in a nut shell.

If 50,000 out of the 275,000 farmers in the state should send me a dollar each it would amount to $50,000—and do you know what I would do with that money? First, I would pay every dollar of debt which now hangs over The Missouri Farmer. Then I would hire at my own expense a half dozen of the best farm club organizers I could find and send them into every county in the state—keeping them going until every county was organized from end to end. Then I would put a capable man at the head of the "Farmers Market Club" work and not only would we help the members of every farm club to buy their feed, coal, flour, fertilizers, etc., at cost but we would also find the best possible market for their grain, hay, apples, wool and other farm products. Then I would hire some man like W. D. McKee whose heart is in his work and let him put in his whole time visiting farmers in different parts of the state and in each issue of the paper I would want him to write an article about the new things he found out—a sort of traveling Agricultural investigator who would keep us in vital touch with what farmers are doing and saying. Then I would try to get hold of a bright, mature woman in sympathy with farm life and let her spend her time among the farm women of the state—helping them solve the many difficult problems with which they are confronted—planning new farm home conveniences, etc., keeping the readers in touch with their work and wouldn't such a farm paper be **worth while?** But maybe it will never be more than a dream—for many splendid things which would make the world a better place to live in are never permitted to become living realities.

In any event, should I be compelled to step aside, I trust that Mr. Ellis, who I consider the soundest Agricultural thinker and counselor in the Corn Belt, and whose labors the farmers of this state will never be able to amply reward may continue as Managing Editor. But whether myself, the author of "After-Thoughts," the "Professor" and "Old Jim Riley" shall continue to play our humble parts in the columns of The Missouri Farmer—this is for you my friends and your neighbors to determine during the next two or three weeks. If we are compelled to go—rest assured it will be with heartfelt reluctance. **The matter is up to you—and the days which pass between now and March 20th will decide it.—William Hirth.**

RYE MORE PROFITABLE THAN OATS

One of our readers W. W. Braden of Audrain County writes as follows:

On my visit to Indiana last fall I visited in Brown, Jackson and Bartholomew counties that state and during my stay I did not see a single stack of oats straw. In that section they rotate their ground with corn and rye instead of corn and oats as so many farmers do here and from what I could learn they make farming pay better than we do and they have fewer failures. Their crops of rye average from 16 to 24 bushels an acre and the price around 95 cents at thrashing time. Rye is a good crop to clear foul ground of weeds and put it in good shape for a corn crop to follow.

The aim of most farmers here in east half of Audrain County is to change to more grass land and more cattle and that will eliminate the hired man to some extent and build up the land at the same time. Under this plan a small field of pasture land can be plowed up every two years and we will get rid of a part, at least, of the heavy fertilizer bills. With small fields and more stock we can cover the field with a good coat of manure about every two years and under this system one-half the land we have been cultivating under the old plan will grow about as much corn we have been getting from twice the number of acres and thus raising our grain at a minimum cost.

Editorial Comment: The above letter contains some valuable suggestions and especially the idea of making our land richer and reducing the expense of growing grain so as to make a combination of grain farming and live stock raising profitable.

The growing of rye for grain has not been generally adopted in this state because as a rule wheat growing has been more profitable but by growing rye in connection with some system of live stock raising there may be some advantages of rye over wheat. When compared with oats rye has considerable advantage in the fact that it provides a good winter covering for the land, saves leaching of fertility and soil washing, provides fall and winter pasturage and as Mr. Braden suggests will clean foul land better than oats. When compared with wheat about the only advantage rye has is that it is a little more hardy, will stand a little more tramping and will come on a little faster in the Spring. Except in rare localities when there may be a demand for seed rye we can not count on getting as high a price for rye as we can for wheat. Taking a number of years average we find that wheat will sell for ten or fifteen cents more a bushel than rye will bring. If we take the average yield of winter wheat and rye for a period of ten years in the United States we find that the average yield is practically the same. If we had a piece of very poor land we would count on a little better chance for a crop with rye than with wheat but with good land not many farmers will make enough greater yield of rye over wheat to make up the difference in price. But whether we grow wheat or rye we should aim to grow some crop if possible that will hold our land from washing during the winter. When it is necessary to follow corn with corn, rye may be sown in the corn in August or September and will pasturage to pay for the seed and labor and then furnish a fine crop of green manure to turn under in May in time for the next crop of corn. Another method for handling the rye in Spring is to seed clover and timothy with it and pasture it off or cut it when in full head for hay. There is just one danger in pasturing if chinch bugs are numerous the standing rye gives them an ideal place for hatching and the bugs may do more damage to some adjoining field of corn than the rye is worth.

Speaking again of oats we doubt very much if one crop in four in this latitude pays expenses without any profit at all. One reason for this is that we have let our land run so low in humous that we can not sow the oats early enough and the ground dries out so quickly after a rain that the crop is cut short. We think the most important question before farmers is to find some system of farming that will put into the soil humus and fertility which must be done by turning under green crops or putting on manure.

Live Stock Judging Contest

The Ninth Annual Live Stock Judging Contest held for the short course men in the College of Agriculture, February 19, was the most successful ever held in the University, at least from point of enthusiasm and numbers participating. This contest is made possible by the liberality of a few well known breeders of Missouri who contribute the prizes.

W. B. Harrison, Fulton, Mo., made a total score in judging of 664 points out of a possible of 800 and was the high man in the contest. For his good work and good judgement he received a certificate presented by the College of Agriculture. Kalo Monsess, Smithton, won the Longview Farm Horse Medal; Frederick Brown, St. Joseph, won the Model Farms Hereford Cattle Medal; The Brookfield Farms Hampshire Hog Medal was won by Harold Whitaker, Carmaron, the Gill Sheep Medal was won by Frank O. Wilson, Nashua. Forty men made a passing grade on the following classes: Draft Horses, Light Horses, Hereford Yearling Heifers, Shorthorn Yearling Heifers, Poland China Gilts, Duroc Guilts, Fat Lambs and Shropshire Ewe Lambs.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VIII March 1, 1916 No. 5

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

THE LAND BANK PETITIONS

Every reader who wants to see the amendment adopting the Gardner Land Bank Bill put on our statutes should see that a petition is circulated in his neighborhood. The petitions must have five per cent of the legal voters in eleven of the sixteen Congressional districts of the state and this means several thousand names. These names can be easily secured if every man who wants to see this Act go into effect will first get busy and if no petition has already been circulated you ought to get busy right now and see that a petition is presented to every voter. If you want to help this work along just write to Mr. A. T. Edmonston, Jefferson City, Mo., who is secretary of the committee and he will send you the necessary blanks. Remember, this is a farmers' measure and unless the farmers help it along no one else is likely to do it for him. It will take but little time to get 50 or 100 names on a petition, and if at least one petition goes in from every township there will be no doubt about the success of the amendment.

EXEMPTION OF LAND BANK BONDS

A number of our readers have written us asking information about the exemption of the debenture bonds provided for in the Gardner Land Bank Act. Some have the opinion that if this Act is approved that all bonds will be exempt from taxation. In answering let us here quote just what the amendment to be voted on this fall has to say: "Section 3. The General Assembly is hereby authorized and empowered to enact a law or laws exempting from state, county and municipal taxes the assets of said Missouri State Land Bank and all debenture bonds by it." This shows that no other bonds except those of the Land Bank are in any way affected by this amendment. There are two primary objects sought in this legislation: Cheaper money and longer time loans with the amortization plan. In order to get cheaper money we must cut out all unnecessary expense in placing loans. This is done in the Gardner Land Bank by requiring existing state officers and departments to discharge the duties of the Land Bank without any more pay than they are now getting. Then to get cheaper money the bonds must be so attractive that they will sell when drawing a low rate of interest. Our inquirers must bear in mind that the State has no money to loan and all the State is seeking to do under this Act is to bring lender and borrower together so they can do business sanely and with little expense. If a farmer should execute a mortgage on his farm and offer to sell it on the market there would be no sale for it unless possibly by someone acquainted with the farmer and his land. But when the Missouri Land Bank, acting as the agent of a thousand farmers and holding each individual's mortgage offers to sell debentures based not on one farm, but on a thousand farms, the risk is so much better and is in a way further guaranteed by the capital and reserve of the Land Bank that those with money to invest will buy the bonds at a lower rate of interest. The framers of this law have tried to make it so the money to buy these bonds could be had at home as nearly as possible. Now, suppose that some farmer has a few hundred dollars saved up, or if a widow has $2,000 or $5,000 of life insurance money left her or it may be the tenant farmer or the hired man or the country school teacher is saving some money and desires a safe place to invest it. If these people are offered the bonds bearing only 4.3 per cent and they have to pay the averag rate of taxes in the country which is around one and a half they would have net only 2.8 per cent for their money, so as a matter of course they would not buy the bonds. If the person with money lives in the city it will be even worse because the total tax rate in cities will run from 2 to 3½ per cent.

We know how easy it is to cry out that exemption of these bonds is in the interest of the money loaner but if we look at it from a practical point of view we will see it is the only way to give farmers cheaper money and then as a matter of fact we know that very little of this money is ever given to the assessor any way. There are a great many millions of dollars of school, municipal and road bonds outstanding in Missouri. There are something like $225,000,000 of mortgages on Missouri farms. Then there are several million dollars of notes held by the citizens of the state and several millions of money on hand and yet the assessors of the state only find a little more than $100,000,000 of all this wealth. In the light of these facts certainly no harm will be done by the exemption provided in the Missouri Land Bank Act.

BEGINNING OF A GOOD OAT CROP

For several years most farmers have been awake to the importance of knowing before planting time that the seed corn was all right but we fear too many neglect exercising the same care in selecting their seed oats. There is great reason this year for examining the seed oats because not many farmers got the oats in the bin last year without a great deal of damage from the wet weather. If thoroughly sound seed can not be obtained considerable improvement may be made in damaged oats by running the seed through the fanning mill two or three times. This process will not only get rid of weed seeds, dirt and broken straws which bother in sowing but it will blow out the lighter grains. Most of the sprouted, infertile grains can thus be separated from the heavy, fertile seed. After the seed is thoroughly cleaned in this way it should be treated with formalin for prevention of smut as recommended in the last issue of The Missouri Farmer.

DEATH OF HENRY WALLACE

The death of Henry Wallace which occurred in his home town, Des Moines, Iowa, on Tuesday, February 22, 1916, has deprived this country of one of our greatest agricultural leaders. Mr. Wallace was the founder of Wallaces' Farmer and for more than twenty-one years had been its editor and through the soundness of his teaching on agriculture and his plendid Christian character no man has done a greater service for the farmers of this country than he did. Mr. Wallace was educated for the ministry but on account of failing health at about the age of 40 he gave up the ministry and took up farming and later with his sons established the paper which has been a powerful factor in developing more profitable farms and better farm homes, not alone in Iowa, but throughout the whole country. Mr. Wallace was active until the day of his death, being almost eighty years old, and the end came peacefully and without warning in the church where he had gone to deliver an address to the Laymen's Missionary Convention.

D. H. DOANE QUITS UNIVERSITY

No one connected with our State University is better known to the readers of The Missouri Farmer than D. H. Doane, state leader of farm advisers and formerly Professor of Farm Management and no doubt they will be surprised to learn that he has resigned his position to accept a more lucrative place with the Mississippi Valley Trust Company of St. Louis. The company has a large business in farm loans and it is in this department that Mr. Doan will work. The members of the Missouri Farm Management Association, one of the largest and most active of all the associations meeting during Farmers Week we are sure will join with The Missouri Farmer in hoping that Mr. Doan may be as successful in his new work as he has been in the field he is giving up.

While Missouri has a lot of good men left it goes without saying that during the last few years we have lost entirely too many of the men who have grown up here and have by faithful service got hold of some of the farmers' real hard problems.

A FARM CLUB AT WORK

For the last six years we have been urging farmers to organize farm clubs and pointing out a number of things the clubs could do to bring profit to the farmers. There are many advantages coming to most all farm clubs of a social and educational nature and these are alone sufficient for the trouble of maintaining a club in every neighborhood. But we realize that under existing conditions farmers have a right to expect economic benefits to come immediately from their club work and this may be brought about without sacrificing any of the social and educational advantages.

Below we publish a letter which tells briefly but plainly what a club in Northwest Missouri has been doing along the exact lines we have urged all clubs to work. A study of the business this club has been doing will show that the saving in buying such articles as coal, feed, seed oats, flour, fertilizer and binding twine is due more to a saving in the expense of handling these commodities than to anything else. When a dealer engages in this business and buys or rents a place of business he not only gives his time to his business but invests his capital, pays insurance, taxes and other expenses, all of which it is only reasonable to say he should have pay for this service. The dealer handling these heavy articles must go to the expense of unloading and storing them and again loading them into the farmers wagon and while this costs the dealer something it adds nothing whatever to the value of these articles. When the farmers get together and buy through the club they cut out this unnecessary handling—they meet and take their goods direct from the car and save a considerable part of the cost.

While there are many things farmers can buy and sell to advantage in a cooperative way, judging from past history we think it is a great mistake for farmers to attempt to enter the field of retail merchandising. In the Grange movement back in the seventies hundreds of retail stores were started by local granges but hardly one in a hundred was successful and most of them caused severe loss to the stockholders. But with things farmers are familiar with and which can be handled without loss or without being held over or getting out of date experience has shown that it takes very little effort or business experience for farmers to save quite a lot of money.

Let every man read the following letter carefully and then ask yourself "why you have not already organized a farm club in your neighborhood?"

To The Missouri Farmer:

Our local here is a sub-order of the Missouri Division of the Anti-Horse Thief Association, and has a membership of about seventy members, all farmers. A few years ago we conceived the idea that if we were a benefit to one another in the prevention of crime, we could also help each other and ourselves individually, by buying such articles as we used in car load lots. This section of Missouri being mostly prairie, we found that everyone used coal as a fuel and we tried shipping in coal as a starter. We

WHAT IT MEANS

Elsewhere in this issue will be found an interesting article on the money saved by the famers organization at Carl Junction, Mo., and we do not see how any farmer can read it without going to the telephone, calling up his neighbors and suggesting the immediate organization of a Farm Club in his community. When farmers in other parts of the state are saving hundreds of dollars annually through co-operation, is it not the sheerest stupidity for you and your neighbors to keep on drifting with the current and paying unnecessary tribute? Furthermore, all that is necessary to be done is for you and your neighbors to avail yourself of our Farmers Market Club through which we will gladly supply you with wholesale prices on bran, shipstuff, oats, hay, flour, coal, fertilizers, binding twine and also help you to find the best possible market for your wool, surplus feed and other similar products. In other words, we have already worked these things out for you and all you and your neighbors need to do is to "get together". Has a farmer who isn't willing to help himself got much right to kick when he keeps coming out at the small end of the hole? Isn't it time to get busy? Why not call a meeting at once and then let us hear from you?—The Missouri Farmer.

made up an order for three cars and found when freight and shrinkage were deducted we had saved $1.50 per ton. We now order about ten cars each fall and last fall laid our coal in at $2.55 per ton and saved from the regular price asked by the local dealer ($4.00 per ton) $290. We had done so well on coal that we next tried twine and the first year we saved three cents a pound, a nice profit, don't you think? As everyone used commercial fertilizers we again invaded a new field and to our surprise we saved from $5 to $6.50 a ton on this commodity. We used five cars of it and the profit on one car would be a nice income on the money invested—a car running about sixteen to twenty tons.

We have not tried selling our grain in car lots except in two or three instances, but each time have made a profit. My brother loaded a car and made $96 on it and our only expense was a man to back it in the car. If the millers can get rich buying your wheat and shipping it and buying it at non-competitive points within 150 miles of Kansas City, 15 to 18 cents under that market, one had better ship it out of the country and he can make from $50 to $100 on every car of it, according to test. I have told my neighbors that we could build an elevator and it would pay a big dividend on the investment and never handle a dozen cars of grain a year. (We suppose Mr. Ross means that competitors would be compelled to pay a better price and farmers would get more for their grain even though their own plant stood idle—Editor.) We have but one grain buyer at Carl Junction, hence we are at the mercy of the company that put in the elevator. If you have a good article it will pay every time to sell it in car lots, even though it takes three or more individuals to make up a car. Even though it does not go out of the country, if you have a number of milling companies there, there will be open competition as soon as loaded.

What we have accomplished in this community can be accomplished in yours, dear reader. Why should not every farmer and stock grower, every fruit and grain gower join with The Missouri Farmer in the great effort it it striving for? Don't you like to hear a fellow speak out in meeting? Well, The Missouri Farmer is "speaking out," and it is speaking out to the great masses of agriculturists in this great commonwealth in no uncertain tones.

Don't the shoe fit you? Don't it pinch just a little? Let's try to save some of the profit of our year's labor. We can save it by uniting, banding together, both in buying and in selling.

Frank F. Ross, Carl Junction, Mo.

BARNYARD GOSSIP

It does seem to me that if there is one crying need for change in the way the retail business is conducted it is to wipe out the credit system. The credit system has broke more merchants than all other causes combined. The merchant who sells on credit must buy on credit and no one of intelligence need be told that the cash buyer can get better prices than the man who buys on time. The two important reasons why the mail order houses can undersell local merchants are, first, they do a strictly cash business, and, second, they buy in large quantities, thus enabling them to reduce the average cost of doing business.

The only way our local merchants can meet the second difficulty is by cooperative buying and fewer and better stores. But this is entirely a merchant's problem and if they want to live against the present killing competition they must find a way to get together—but they can't do it by standing idle and abusing farmers for patronizing outside merchants who can undersell them.

Now, as to the first reason we have given, "Why local merchants cannot meet prices of catalog houses," if there is any change in that it will be when the farmers and other consumers demand it. The man who buys for cash has the right to demand of his merchant a better price than that given to the credit buyer. The man who buys for cash and the man who buys on credit, but who is good and always pays his bills, do not want to have to pay for the things the "dead beat" buys on time. Under the present system of selling on time there is no way out but for the honest man to pay the dishonest man's bills.

Adopting the cash system does not mean that no one can go in debt, for every year it seems that a greater percentage of business is done on credit, but credit should always be confined to those things which are productive. If a man borrows money to buy a milk cow, brood mare, young, growing stock he can reasonably expect that when the note is due the value of the animal together with what it has produced will pay the debt and leave something for profit. On the other hand, when a man goes in debt for something to eat or to wear, or in other words, for living expenses, when the debt comes due there is nothing on hand to pay with. If all consumers, including farmers, would adopt the rule never to go in debt for anything but for something they expect to get a profit out of we would have a great many more people of independent means in the country.

One advantage the farmer has in living expenses is a good garden, some good cows and a flock of hens. One acre of good land cultivated thoroughly in a variety of vegetables and small fruits will supply most abundantly any family of five persons and so far as fruits and vegetables are concern the family can live equal to any millionaire in the land. Yet in the face of these facts merchants tell me they have accounts with farmers runn two to six months and sometimes a year with charges for canned fruits and vegetables, dried fruits and vegetables, bacon, meal, flour, etc., the very things every farmer ought to produce and which thousands do produce and are not worried about grocer's bills. The man who stints himself for one month and then is in position to pay cash and take discounts will find that he has gained a pretty big reward for his slight inconvenience. Few men have obtained independence without making some sacrifice.

FARM WAGONS

High or low wheels—steel or wood—wide or narrow tires. Steel or wood wheels to fit any running gear. Wagon parts of all kinds. Write today for free catalog illustrated in colors.

ELECTRIC WHEEL CO., 63 Elm Street, Quincy, Ill.

SOUR MILK MAKES EGG COST LOW

Eggs laid by hens fed plenty of sour milk cost 10.3 cents a dozen as the year's average. Those laid by hens fed beef scraps, rich protein foods, cost 12 1-3 cents, while those fed only on grains and mash cost 22 2-3 cents a dozen.

These are the results of the poultry feeding experiments through a year recently completed at the College of Agriculture of the University of Missouri, at Columbia. The tests were made on three separate pens of twenty-five fowls each, the White Leghorn being the breed of chickens used.

The chickens of the first pen ate during the year 956 pounds of grain and 446 pounds of mash, with all the sour milk they would drink. The feed cost $28.18. They produced 3,275 eggs. In the pen in which beef scraps were fed, the flock ate 1,095 pounds of grain and 422 pounds of mash, one-fourth of the latter being beef scraps. The cost of the feed for this pen was $27.51, and the number of eggs produced was 2,668. The chickens in the other pen were fed no meat or protein foods. They ate 1,046 pounds of grain, 409 pounds of mash and laid 1,373 eggs. The feed for this pen cost $26.01.

Don't fail to read carefully the article "It's Up to You," to be found elsewhere in this issue. It contains a message of great importance.

Pull Out Stumps With the Famous Hercules!

Triple-Power

Pull an acre or more of stumps a day. Pull any stump in 5 minutes or less. Don't have loafer land when it's so easy and cheap to *pull the stumps out!* Make 1000% profit by using the Hercules. $1281.00 the *first year* on 40 acres! $750.00 every year after. Let us *prove* it.

Low Price and Book Free!

Get the facts. Read our book. Tells what all steel, triple power means. Shows many features of the Hercules. Shows many photos and letters from owners. Postal will do.

P&O

One-Horse Cotton Planters

One-Horse Planters of every good type, and with various equipments, to meet all requirements. All P&O Planters are high grade and first class; "It's the Way We Build Them."

P&O No. 2 One Horse Cotton Planter

The P. & O. No. 2 is the most popular cotton planter in the south. Has runner opener, covering blades and press wheel. Gear drive; automatic throw-out. Reverse feed wheel travels in opposite direction to that of agitator, thoroughly separates seed, insuring uniform planting. Hopper is very large; quantity of seed sown is easily regulated. Can be converted into a Corn Drill; corn plates are supplied. Parts can also be supplied for planting beans, peanuts, onion seed, kafir corn, etc.

P&O No. 27 One Horse Cotton Planter

The P. & O. No. 27 is a combined Cotton and Edge Drop Corn Planter with a Fertilizer Distributer. Reverse cotton feed, and our famous edge drop construction for corn. Gear drive. Equipped with furrow shovel, runner, covering blades and press wheel.

The P. & O. No. 156 is a Pitman Drive Cotton Planter. The equipment is similar to that of the No. 2, but the feed mechanism is driven by pitmans inside the frame. One piece axle and crank. Hoppers can be instantly removed. Flat or spiked tire. Construction simple and rigid throughout.

The P. & O. line includes other well known types of One Horse Planters.

The Plunderer

By ROY NORTON

Author of "The Garden of Fate"

Something in the attitude of the two appeared to render him more alert, more hard, more uncompromising, and he frowned, as Dick had seen him frown before when angry men made way for him and his dominant mastery. His daughter had stopped in front of the closed door, and eyed him with eyes no less determined than his own.

"Your men are working under the Croix d'Or," she said coldly, without wasting words in preliminary.

His face hardened instantly, and his eyes flamed, dull and defiant. The lines of his heavy jaw appeared to deepen, his shoulders lifted a trifle, as if the muscles of him had suddenly tensed for combat, and his lips had a trace of the imperious sneer.

"Oh, you're certain of that, are you, my girl?"

"I am," she retorted. "I was in their lower level when the Rattler's shots were fired. I heard them."

For an instant he seemed about to leap from his chair, and then, recovering himself, said with sarcastic emphasis, and a deadly calmness: "And pray what were you doing there? Was the young mine owner, Townsend, there with you? Was he so kind—?"

"Is there any need for an exchange of insults?" Dick demanded, taking a step toward him, and prevented from going farther only by recollection of his previous loss of temper.

For an instant the mine owner defiantly met his look, and then half-rose from his chair, and stared more coldly across the litter of papers, plans, and impediments on his desk.

"Then why are you here together?" he demanded. "Weren't you man enough to come yourself, instead of taking my daughter underground? Did you want to compel her to be the chief witness in your claim? What right had you to—?"

"Father!" admonished Joan's voice.

It served a double purpose, for had she not interrupted Dick might have answered with a heat that he would have regretted, and Bully Presby dropped back into his chair, and drummed with his fingers on the desk.

"You took the ore. You must pay. You must!" went on the dull voice of his daughter.

"But how should I know how much it amounts to, even if I do find out that some of my men drove into the Cross pay? " he answered, fixing her with his flaming eyes.

"But you must know," she insisted duly. "I know you know. I know you knew where the ore was coming from. It must be paid back."

For an instant they eyed each other defiantly, and her brave attitude, uncompromising, seemed to lower the flood-gates of his anger. His cheeks flushed, and he lowered his head still farther, and stared more coldly from under the brim of his square-set hat. There were not many men who would have faced Bully Pesby when he was in that mood; but before him stood his daughter, as brave and uncompromising as he, and fortified by something that he had allowed to run dwarf in his soul—a white conscience, burning undimmed, a true knowledge of what was right and what was wrong. Her inheritance of brain and blood had all the strength of his, and her fearlessness was his own. She did not waver, or bend.

"It must be paid back," she reiterated, a little more firmly.

He suddenly jerked himself to his feet, his tremendous shoulders thrust forward across the desk, and raised his hand with a commanding finger.

"Joan," he ordered harshly, "you get out of here. Go to your room! Leave this affair to this man and me. This is none of your business. Go!"

"I shall not!" she defied him.

"I think it is best," Dick said, taking a step toward her. "I can take care of my own and Mr. Sloan's interests. Please go."

The word "Joan" almost slipped from his lips. She faced him, and backed against the door. "Yours and Mr. Sloan's interests? What of mine? What of my conscience? What of my own father? What of me?"

She stepped hastily to the desk, and tapped on it with her firm fingers, and faced the mine master.

"I said you must pay!" she declared, her voice rising and trembling in her stress. 'And you must! You shall!"

He was in a fury of temper by now, and brought the flat of his heavy, strong hand down on its top, sending the ink-well and the electric stand lamp dancing upward with a bound.

"And I shall do as I please!" he roared. "And it doesn't please me to pay until these men"—and between the words he brought his hand down in heavy emphasis—"until— these—men—of the Cross mine prove it! I'll make them get experts and put men in my mine, and put you yourself on the stand before I'll give them one damned dollar! I'll fight every step of the road before I'll lay my hand down. I'll pay nothing!"

She stood there above him, fixing him with her clear, honest, accusing eyes, and never faltered. Neither his words nor his rage had altered her determination. She was like a statue of justice, fixed and demanding the right. Dick had rushed forward to try and dissuade her from further speech, and cumulated in that ruin of faith.

Dick looked down at her, and his nails bit into his palms as he fought off his desire to reach down and lift her to his arms. Bully Presby's chair went clashing back against the wall where he kicked it as he leaped to his feet. He ran around the end of the desk, throwing Dick aside as he did so with one fierce sweep of his arm.

"Joan!" he said brokenly, laying his hand on her head. "Joan! My little Joan! Get up girl, and come here to your Dad!*"

She did not move. The excess of her grief was betrayed by her bent head and quivering shoulders. The light, gleaming above her, threw stray shadows into he depths of her hair, and softened the white, strained tops of her fingers.

Bully Presby, the arrogant and forceful, still resting his hand on her head, turned toward the twisted, youthful face of the man at his side, whose fingers were now clenched together, and held at arm's length in front of him. The mine owner seemed suddenly old and worn. The invincible fire of his eyes was dulled to a smoldering glow, as if, reluctantly, he were making way for age. His broad stood at the end of the desk in the halo of light from the lamp, and there was a tense stillness in the room which rendered every outward sound more distinct. The voice of a boy driving mules to their stable and singing as he went, the clank and jingle of the chain tugs across the animals' backs, and the ceaseless monotone of the mill, all came through the open windows, and assailed their ears in that pent moment.

"Please let me have my way," Joan said, turning to Dick, and in her voice was infinite sorrow and tragedy. "It is more my affair than yours now.

1775 *1916*

We Are Prepared

Within the wide boundaries of our country, embracing more than three million square miles, dwell a hundred million people.

They live in cities, towns, villages, hamlets and remote farms. They are separated by broad rivers, rugged mountains and arid deserts.

The concerted action of this far-flung population is dependent upon a common understanding. Only by a quick, simple and unfailing means of intercommunication could our people be instantly united in any cause.

In its wonderful preparedness to inform its citizens of a national need, the United States stands alone and unequaled. It can command the entire Bell Telephone System, which completely covers our country with its network of wires.

This marvelous system is the result of keen foresight and persistent effort on the part of telephone specialists, who have endeavored from the first to provide a means of communication embracing our whole country, connecting every state and every community, to its last individual unit.

The Bell System is a distinctly American achievement, made by Americans for Americans, and its like is not to be found in all the world.

Through it, our entire population may be promptly organized for united action in any national movement, whether it be for peace, prosperity, philanthropy or armed protection.

AMERICAN TELEPHONE AND TELEGRAPH COMPANY
AND ASSOCIATED COMPANIES

One Policy *One System* *Universal Service*

Father, I shall not permit you to go any farther. It is useless. I know! I can't do it! I can't keep the money you gave me. It isn't mine! It is theirs! You say you will not pay. Well, then, I shall, to the last dollar!"

"But I shall accept nothing—not a cent—from you, if we never get a penny from the Cross!" declared Dick, half-turning, as if to end the interview.

She did not seem to hear him. She was still facing the hard, twisting face of Bully Presby, who had suddenly drawn back, as if confronted by a greater spirit than his own. She went on speaking to him as if Dick was not in the room.

"You stole their ore. You know you stole it. Somehow, it all hurts so that I cannot put it in words; for, Dad, I have loved you so much—so much! Oh, Dad! Dad! Dad!"

She dropped to her knees, as if collapsed, to the outer edge of the desk, and her head fell forward on her hands. The unutterable wail of her voice as she broke, betrayed the desperate grief of her heart, the destruction of an idol. It was as if she told the man across the desk that he had been her ideal, and that his actions had brought this ruin about them; as if all the sorrows of the world had shoulders appeared suddenly to have relinquished force and might. He stooped above her, as if about to gather her into his arms, and spoke with the slow voice of pathos.

"She's right," he said. "She's right! I should pay; and I will! But I did it for her. She was all I had. I've starved for her, and worked for her, and stolen for her! Ever since her mother died and left her in my arms, I've been one of those carried away by ambition. God is damning me for it, in this!" He abruptly straightened himself to his old form, and gestured toward the sobbing girl at his feet. "I am paying more to her than as if I'd given you the Rattler and all—all—everything! — for the paltry ore I pulled from under your feet. You shall have your money. Bully Presby's word is as good as his gold. You know that! I don't know anything about you. I don't hate you, because you are fighting for your own! Somehow I feel as if the bottom had been knocked out of everything, all at once! I wish you'd go now. I want to have her alone—I want to talk to her—just the way I used to, before—before—"

He had gone to the limit. His strong hands knotted themselves as they clenched, then unclenched as he stepped to the farther side of the door and looked at Dick, who had not moved; but now, as if his limitations also had been reached, the younger man leaned forward, stooped, and his arms caught Joan and lifted her bodily to his breast. In slow resignation, and with a sigh as if coming to shelter at last, her arms lifted up, her hands swept round his shoulders, and came to rest, clasped behind his head, and held him tightly, as if without capitulation.

There was a gasp of astonishment, and the rough pine floor creaked as Bully Presby, dumbfounded, comprehending, conquered, turned toward the door. He opened it blindly, fumbling for the knob with twitching hands—hands unused to faltering. He looked back and hesitated, as if all his directness of life, all his fierce decision of character had become undermined, irresolute. He opened his lips as if to protest, to demand, to dominate, to plead for a hearing; but no sound came. His face, unobserved by either the man he had robbed, or the daughter who had arraigned him, betrayed all these struggling, conflicting emotions. He was whipped! He was beaten more certainly than by fists. He was spiritually and physically powerless. Dazed, bewildered, he stood for an instant, then his heavy hands, which for the first time in his life had been held out in mute appeal, dropped to his sides. Habit only asserted when he slammed the door behind him as he walked out into the lonely darkness of the accusing night.

(To be continued.)

RECALL EARLY HARDSHIPS

There was a discussion in our neighborhood as to which article of household equipment contributes the most to the comfort of the modern home and all its inmates and the man who argued that it is nothing more nor less than the little radiator in the corner won the debate and took the neighborhood prize for the best talk on a commonplace article.

There are twenty men and twenty women in our club, and nearly every single one of them championed a different article, ranging from the parlor piano to the little dollar machine the women use to grind up apples and mincemeat. But only one of the bunch thought of the radiator, and he was given the merry laugh at first. They made it unanimous, though, when he got through and the vote was taken on which was the most convincing talk.

I'm not saying that a radiator is the handiest thing a man can have in his house. I'm just telling you what this other man said, and if you had been there and heard it it's a cinch that you would have voted just like the rest of us thirty-nine people did. And really, it's wonderful, when you come to think of it, what a lot of domestic comfort there is in these radiators and what goes with them.

He told about the time when he was a boy and it seemed as though the whole burden of living was bound up in the job of eternally cutting wood and building fires and keeping them going. That made a hit with me, and I guess most of the rest of the bunch were up against the wood fire stunt when they were small, the way they appreciated what he said. We had a stove in the kitchen, another in the dining room, another in the parlor, a big fireplace in the downstairs bedroom and three bedroom stoves upstairs. We didn't keep them all going all the time, but they were all going some of the time, and some of them all the time. In cold weather it was a case of fix the fire, fix the fire, fix the fire, until I used to secretly curse the man who discovered fire. And every stove had to be continually tended, not only to keep the fire going, but to keep it clean. And when it was warm and we didn't need fires, we had to cut wood for the next winter and pile it up in the big wood-shed. And then every spring we had to take down all the stoves and store them away in the barn, and every fall we had to get them out again and clean them up and black them and set them up in their places. Altogether, looking back on it now, a stove looms up as the veriest bane of my early existence, and that of my father and mother and brothers as well.

Now look how the thing is done. Down in our basement there is a boiler not much bigger than our old round sheet iron parlor stove. In the morning I shake it down a bit, and put in a few shovels of coal, and in the evening the same. Once or twice a year a boy carries out the ashes, and that is all there is to it from one year's end to another. The little regulator on the boiler automatically opens the door when the heat goes below a certain point, and it closes it again when it begins to get too warm. From the time we start the fire in the fall until we let it go out in the spring the whole of the house is maintained at the even temperature we desire, say 75 degrees, no matter how cold or how warm the day may be outdoors. We pay a very moderate coal bill; the boiler downstairs and the little radiator in the corner do the rest.

The modern heating companies have simply brought steam and water heating to perfection, for all kinds of homes, no matter how small. The radiators take up so little room as to be of no consequence; the new designs are an ornament to a room, rather than otherwise; they do not generate constant dirt like a stove, and they do not spot dust like the registers of a hot air furnace; they can be painted or gilded every year to match the furniture or wall paper, and they are always doing business with the least possible attention. My wife never worries lest the fire go out and the children take cold, the house is always the same, no matter what time of the day or night, and my boys are not being brought up to dread the very name of fire. When you come to think about it, it isn't so much of a wonder that the man who picked the radiator as the greatest home comfort won the prize unanimously. "Uncle James"

Profit from Every Hill

International and C B & Q Planters

NEXT in importance to good, tested seed, every authority on corn raising places good planting. Evenly spaced hills; the same number of kernels dropped in each hill; even depth of planting; a reliable foot drop for finishing the field—these are the features demanded of a planter by every careful corn raiser.

This is the standard to which the builders of **International** and **C B & Q** corn planters work, and excellent planting is the result. Note, first, the substantial frame and wheels—the foundation of the machine. Then see how simple are the arrangements that enable you to drop 2, 3, or 4 kernels in every hill, or to drill in your corn with accurate spacing between the kernels. The use of an **International** or **C B & Q** corn planter gives you assurance that every hill of corn on your farm will produce its full share of corn profit.

Try one this year. Ask the local dealers, who handle these machines, to show you their good points in detail, or write to us for complete information about reliable **International** and **C B & Q** corn planters.

Why You Should Buy a Bent

Bent Pianos are the result of many years' experience in the building of high-grade instruments. They are in the hands of experts for months after strings, actions, hammers and keys are in place. The actions are regulated and re-regulated by men who specialize in this delicate work. Tone regulating is done by men of unusual skill, so that quality and equality of tone are perfect. All this means musical value—tone of lasting sweetness—response to every touch—durability.

Free—Valuable Booklets. Send for our booklets which explain piano value, also what to look for in the selection of an instrument for your home. These booklets contain real piano information and guided by them you are sure to select a good piano. They are FREE for the asking. Mail coupon Today.

Home Makers Conference

This Department is Edited by Miss Alice Kinney, New Franklin, Mo.

March is here and it is full time that our plans be made for the coming garden, which should include this year enough to supply two families, for with the upbuilding of the parcel post trade the outlook seems bright for the farm fresh vegetables being in demand by the city consumers.

We make a strong plea for the flower border in the vegetable garden, if no other place is sacred from the chickens; this entire border filled with Perennials will be a thing of beauty and a joy every day during the flowering season.

The preparation of a Perennial bed should be very thorough, especially as the soil cannot be well tended or much enriched afterwards; and in order to sustain a large variety of plants in vigorous growth, it is necessary to prepare the bed well before hand by having the ground loose to a depth of at least two feet—the English think nothing of making the Perennial bed four feet deep—throw off the top soil then dig up the subsoil and mix with it a liberal supply of manure and wood ashes, besides keeping the surface soil rich at all times.

Select an open sunny situation far away from the roots or shade of trees. Perennials are easily grown from seed, though they are slower germinating than annuals, but with care they can successfully be raised and it is an excellent way to get up a big stock in a short time and at less cost.

Many Perennials, if the seed be sown early in the spring, will bloom freely the first year while others wait a year before blooming but will then give pleasure for years.

While waiting for them to grow into a size that will give a permanent effect in the border we can turn to the Annuals for quick returns and here the list is almost endless from Sweet Peas to Zinnias and Verbenas and many others that are familiar to all.

Do reserve a spot for the rose the "Queen of Flowers", by commencing with a few plants, you can add more each year, thus the cost will be very small when compared with the joy they will give you for their care.

This is the month to start your tomato seeds, if you desire early plants by planting in a small box in the house and keeping them at an even temperature, with all the sunlight possible, they are large enough to transplant and by holding them in the cold frame until warm enough to plant in open ground, thus prolonging the bearing season many weeks.

Baby Welfare

The week March 4 to 17 has been set aside by Miss Julia Lathrop, head of the Children'sc Bureau, Washington City, as "Baby Week," and the General Federation of Women's Clubs in cooperation with the American Medical Association has made this a national observance. In those communities where the week appointed cannot be observed it is suggested that some other week be chosen. Every house in the county that can boast a baby under three years of age should help in making this a week of community education on Baby Welfare.

Directions and assistance may be obtained by addressing "Children's Bureau, Washington, D. C. Attention Mrs. Goodwin."

HATCHING CHICKS MUST HAVE GOOD AIR

Moisture and ventilation are two features of artificial incubation of eggs that should receive careful consideration, says the poultry husbandman of Clemson College. This is especially true in the latter part of the hatch.

When the incubator is operated in a dry room, thoroughly sprinkle the eggs on the tenth, fourteenth and eighteenth days with water of 106 degrees (warm to the hand), removing the tray partly and scattering the water with a whisk broom. Open the ventilators throughout the hatch. Do not place a tray of wet sand or water under the eggs, as it is an ideal medium for the development of mold.

The egg chamber must be filled with moist air when the chicks are p[illegible] the shells on the nineteenth and twentieth days of incubation; otherwise the shell membranes become dry and tough and many chicks are imprisoned. Pure air is also necessary at this critical time. Both conditions can be had simultaneously.

Closing the door of the egg chamber from the eighteenth day to the completion of the hatch (about four days) is the direct opposite of natural incubation and contrary to all rules of hygiene. The sitting hen exposes the pipped eggs constantly in her instinctive desire to assist with her beak the chicks emerging from the shells. The ventilation of the egg chamber is inadequate for a number of live chicks, the poisonous carbon dioxid exhaled by the earliest hatched chicks vitiating the air and rendering it unfit to breathe.

The chicks open their beaks and gasp for breath, not because they are overheated, but because the impure air suffocates them. Human beings could not survive four days' close confinement in a room with practically no ventilation, yet embryo chicks are expected to undergo in a foul atmosphere the difficult process of birth.

Do not turn the eggs after the chirp of the first chick is heard. If the glass of the door is not dripping with moisture, withdraw and sprinkle the eggs on the trays with warm water as previously described. Close the door until the early chicks are hatched. Then partly withdraw the trays, place the dry chicks in the chick chamber underneath, roll the eggs around, and sprinkle eggs and newly hatched chicks with warm water. Wet the front of the trays and the inside of the egg chamber also. The whole operation should not require more than two minutes. Withdraw the trays and sprinkle the eggs as often as necessary to maintain pure, moist air in the egg chamber. When the door is closed the glass rapidly shows excessive moisture and the interior temperature rises to the desired degree.

Bumper Grain Crops
Good Markets — High Prices
Prizes Awarded to Western Canada for Wheat, Oats, Barley, Alfalfa and Grasses

The winnings of Western Canada at the Soil Products Exposition at Denver were easily made. The list comprised Wheat, Oats, Barley and Grasses, the most important being the prizes for Wheat and Oats and sweep stake on Alfalfa.

No less important than the splendid quality of Western Canada's wheat and other grains, is the excellence of the cattle fed and fattened on the grasses of that country. A recent shipment of cattle to Chicago topped the market in that city for quality and price.

Western Canada produced in 1915 one-third as much wheat as all of the United States, or over 300,000,000 bushels.

Canada in proportion to population has a greater exportable surplus of wheat this year than any country in the world, and at present prices you can figure out the revenue for the producer. In Western Canada you will find good markets, splendid schools, exceptional social conditions, perfect climate, and other great attractions. **There is no war tax on land and no conscription.**

Send for illustrated pamphlet and ask for reduced railway rates, information as to best locations, etc. Address

90 bu. per acre from stump land!

When David Bennison of Iowa bought a sixty acre tract of Cypress covered land near New Madrid, in

Southeast Missouri along the Cotton Belt Route

the neighbors laughed at him. But Bennison knew **good** corn land. He cleared that tract, planted corn, and the first yield—grown among stumps—brought 90 bu. per acre. The wonderful depth and fertility of soil there is amazing. 90 bu. per acre there is better than average but not uncommon. Mr. Mahoney of Dexter, Mo. says "Last year our corn yielde 1 75 bu. per acre. We have made 90 bu. and it will run above 60 bu. an acre year in and year out". Mr. Hunter of New Madrid says many of his fields of corn average 80, 90 and 100 bu. per acre. There isn't a richer soil in America than that in Southeast Missouri.

There isn't a section anywhere where you can buy rich land so cheap that the first **staple, field** crop will pay for its cost and clearing (if you buy unimproved). And that rich soil makes wonderful yields of **anything.** C. D. DeField of East Prairie says "We cut our alfalfa every 28 days; five times a season. It averages a ton per cutting. Clover does well; in fact any kind of feed or pasture, I raised 40 mules last year without doing **any winter feeding** at all. Cattle and hogs go through winter here without feeding." 90 bu. per acre corn land at $35 will go quick; act!

Free book—illustrated!

A farmer wrote it; and he knows what you want to know about a section new to you. Tells about character and cost of lands, climate, crops raised, etc., and about schools, churches, towns, social conditions. Brimful of actual photograph pictures "taken on the ground." Send today and get this free book.

A.A. Berry Seed Co. Box 180 Clarinda, Ia.

By Old Jim Riley

You can git a fight out of my old friend Bill Bryan on "peace" any hour in the night or day. Youv' got to say this much for a polecat — you can always tell when it's on the job and that's more'n you can say about a lot of other folks in this world. You know I believe if Woodrow was to call me in I could settle this Mexican mess and all the other war stuff. He's relyin' too much on that feller Col. House from Texas—and a Texas feller's idear of makin peace is to take a half dozen high balls and then oil up his six-shooter. Is it any wonder we ain't gitten anywhere with this Good Samaritan stuff?

BUCKSHOT BY THE PROFESSOR.

If Henry Ford isn't careful the police will have to run him in for disturbing the peace.

Old Jim Riley got a bath the other day. It wasn't his fault though. He got caught out in a rain.

The average old batchelor is just about as much of an ornament to society as an old gray mule.

I know a lot of old skin flints who spoil a plug of Horseshoe every day and then get sore when their wives spend a half dollar for a sunbonnet.

If I was in the war over in Europe I'd want to have a job blacking some king's boots or currying his automobile. Then I'd know there would be no danger of my getting shot.

It's getting time to shear the sheep once more—and if a fellow could sell old whiskers and would shear the gang down at "Hez" Brown's store he could do a landoffice business.

Be sure to look up the article in this issue which is headed "It's Up to You"—for it's a mighty serious one to me because it means that maybe you won't have a chance to read what the "fool Professor feller" says much longer.

I wish all the great statesmen we are to have from now on would get together and arrange to die on the same day, because if they keep on dying on different days every day will be a legal holiday by and by.

Read the article by Mr. Ross of Carl Junction in this issue. It shows what the farmers of a community can do when they act together—and why shouldn't the farmers of every school district in the state do the same? Do you know of any reason except that of indifference?

I happened to look over that Jim Riley person's stuff that's in the paper this time and I see where he wants the President to call him in to settle the Mexican fuss. Now, as they say, wouldn't that "get your goat?" If he'd settle for his grocery bills down at "Hez" Brown's he'd be doing a blamed sight better than he's done for a long while.

The "Sunbeam" correspondent sends me the following: Rumpus Ridge, Ark. Deer Professer: I take my pen in hand to let you no that our little boy, Bearcat, won't be to school for several days. Last nite he set down in a steel trap by mistake and he won't be huntin for no other place to set for several days. Hoping these few lines will find you the same. Yours Truly, Mrs. Hy Holler.

DOWN IN POSSUM HOLLER

The bunch lined up around the stove at "Hez" Brown's the other afternoon and most of them reported "present." Old "Chouce" Baker was in an ugly mood. His whiskers got mixed up in the cog wheels while he was turning the corn sheller crank the other day and most of them got pulled out. Consequently he was about as full of fight as a fellow is when he gets religion at one of Billy Sunday's revivals. "Well," said "Jep" Thompson, "I guess they'll renominate Woodrow at the St. Louis convention. He's makin' us a great President and is keepin' us from—" "Renominate him!" roared "Chouce" as if somebody had pulled out the balance of his whiskers. "Of course they'll renominate him. They can't help theirselves. Woodrow and the Democratic party air like the feller that got hitched up to the calf. They've got to travel down the road together—whether you like the calf or not." This "riled" "Jep" and he snorted, "Yes, and you'll have to noimnate Teddy at Chicago. He just whacks you Republicans around as if you was a bunch of old flea-bitten mules and you ain't got the nerve to resent it. Why, if that broncho buster ever gits back into the White House it won't be thirty days before he'll be pickin' a fuss with the angels." "No, we won't," said "Chouce," "we'll nominate Hughes an' we'll—" "You won't do nuthin of the kind," roared back "Jep." "He'll have the whole outfit of you so tame by the time the convention rolls around that you'll eat out of his hand"—but at this juncture a candidate dropped in and set up the cigars to the crowd.

MY EXPERIENCE WITH SUDAN GRASS

I have two letters asking about this grass. In 1915 I grew two plots of it, one in drills on very wet land, the other broadcast in medium soil. It did well in both plots, and as a feed I like it better than any of the other sorghums or millet. My drilled patch was allowed to ripen for seed and yielded at the rate of 50 bushels per acre. I would advise no one to sow a large acreage, but would like to see a patch grown upon every farm, where more rough forage is needed. Three or four pounds per acre is a good rate of seeding in drills, fifteen pounds broadcast. The richer the land the heavier the yield, and I do not think it adapted to very thin soil. Seed should be bought at 10 to 12½ cents per pound this year and when once grown I think it entirely practical for every one to grow his own seed. It should be sown or planted as soon after the 15th of May as possible for best results, but will cut a heavy crop planted July 1. The May planting will give two full crops of hay.

C. D. Lyon.

How About Your Incubator?

Why not make the hens pay this year? Why not order a good incubator and go on the early markets with some good price? The hens can easily be made to pay for a new cooking range, carpet, dining room or bed room set or even a new farm house furnace. Write to the M. M. Johnson Co., at Clay Center,, Neb., and ask them to tell you about the famous "Old Trusty" Incubator. Then also write to the Belle City Incubator Co., whose advertisement you will find in this issue. Both will gladly supply you with a world of information on how to make money out of poultry. Please mention The Missouri Farmer.

Get the Work Horses in Shape

One of the finest things on the market to put your horses in fine shape for the heavy spring work is Dr. Hess' "Stock Tonic." It makes them shed their old coat of hair quickly, eat with a relish and carry the strain with ease out in the fields. Write to Dr. Hess & Clark at Ashland, Ohio, and ask them for full information and prices. A little money spent to get the work horses in prime condition will prove a mighty good investment. Please mention The Missouri Farmer.

A Comfortable Farm Home

Elsewhere in this issue will be found the advertisement of the American Radiator Co., and we suggest that those of our readers who would like to know all about the cost of a farm home furnace write the company for complete information. The time isn't far off when many farm homes will do away with the old heating stove which doesn't heat the house evenly and which requires such constant attention. Be sure to mention The Missouri Farmer.

We ask every reader of The Missouri Farmer to ready carefully the article "It's Up to You," found elsewhere in this issue. It contains a message of great importance.

Use It For Everything

4 H.P.—190 lbs.

The 4 H. P. Cushman Handy Truck Outfit is the most useful outfit ever built for farm work. The engine weighs only 190 lbs., and the entire outfit only 375 lbs. A child can pull it around from job to job.

Besides doing all the farm and household power jobs, this 4 H. P. Cushman may be lifted from truck and hung on rear of binder during harvest to save horses and save the crop.

Light Weight

Cushman Engines

Built for farmers who need an engine to do many jobs in many places instead of one job in one place. **Throttle Governed,** with Scheblor Carburetor. Run very quietly and steadily—not with violent explosions and fast and slow speeds like old-style heavy-weights. Engine Book free.

ANGUS CATTLE
Breeder's Sales East St. Louis, Ill., March 15 and 16.

Aberdeen-Angus Auction Cattle Sales at the National Stock Yards

On March 15th and 16th there will be an offering of Angus cattle at the National Stock Yards Pavilion, East St. Louis, Ill. that should attract many buyers from a very wide territory around this market. The offering will consist of 115 head, 30 bulls that are top-notchers and 85 cows and heifers that have made good. The first sale will be that of the following well known breeders and exhibitors; Stanley R. Pierce, Creston; A. A. Armstrong, Camargo; S. Melvin, Greenfield; J. Garrett Tolan and the University of Illinois. These breeders of Angus cattle are well known and they have been instrumental in advancing the interests of the breed until today it is one of the most popular beef breeds in the world. The cattle listed by these breeders represent the very cream of their herds and are in the finest condition. They have reluctantly booked animals for this occasion that otherwise they would refuse to sell. The bulls in this offering are the best of last years crop and many of them will be found nothing short of eyeopeners. Every one is a high-class herd header. No such offering of bulls has ever been seen before in the National Stock Yards. All are over a year old and of a serviceable age. They are sure to make your eyes water for them when you have seen them. The cows and heifers listed for this breeders' sale have been carefully selected by a competent judge and they are much better than ever offered in the Southwest before. There is not an undesireable female in the offering. They are all of the most fashionable families and will add strength to any herd. Some good show prospects will be found amon, the heifers.

On Thursday March 16th Durrstine Bro's, Scales Mound, Ill., will disperse a most remarkable lot of cattle. They began breeding Angus cattle with three cows and from those three cows 57 head of the 58 head they are selling have been bred and developed. This lot of cattle are very blocky, beefy, low down, thick and have scale as well as a lot of quality. The writer has sold many herds of Angus cattle and he cannot recall selling a more useful lot of business cattle. They are in the very pink of breeding condition and every cow that is old enough to breed that has not a calf at foot is well long in calf. You will find this offering one of the most attractive lot of coming yearling heifers that have been on the market for years. In this dispersion you will find 10 very classy bulls, all of serviceable age, included is the present herd bull, Ernie 2d of Greenwood 176705. He was 2d prize Junior bull in a very large class in the Chicago bull sale 1914. He is a sire of unusual merit and his get will furnish the evidence. He now weighs over a ton and is a grand individual. His blood lines are the most fashionable, a Trojan Erica of first water. Every fancier of good Angus cattle in the market or going to be soon should arrange to attend both of these sales and secure some of these good things that will no doubt sell worth the money. For a catalog and other information address sale manager, M. A. Judy, 817 Exchange ave., Chicago, Ill.

A County Purebred Beef Cattle Organization

The breeders of purebred beef cattle of Cape Girardeau Co., Mo., met on Feb. 7 in the office of the county agent and organized the Cape Girardeau County Association of Breeders of Purebred Beef Cattle. Thirteen herds were represented. P. C. Clippard was chosen president, J. H. Campbell vice-president and Wash Miller secretary-treasurer. The Shorthorn breeders presnt were Randolph Shaner, J. H. Campbell, B. O. Crites, O. L. Dow, J. R. Hope, Joseph Job & Son, Snider & Lance, and M. C. Kinienger. P. C. Clippard, Brown Clippard, C. C. Mirly, and Wash Miller represented the Aberdeen-Angus interests and E. J. Weiss, the Hereford. It is the purpose of the association to co-operate in advertising and in holding sales and shows, particularly local shows within the county.

Lawrence offers Augus Bulls and Heifers

V. E. Lawrence, Salisbury, Mo., in sending in a change for his advertisement says that he is now prepared to offer some real bargains to our readers. He is now offering for sale, at a reasonable price, his herd bull, Dean's Eric. This bull, a Trojan Erica, is of the right stamp in every way, and some one will get him at a bargain. Mr. Lawrence is now anxious to sell about thirteen coming yearling and two-year-old heifers. The older heifers were bred to the new herd bull, King Wayne 170152 a Ballindallock K. Pride of Aberdeen. This bull was good enough to place second in class at the 1915 Ohio State Fair.

Hereford Bull Worth the Money

Hugh Whiteford, the well known Hereford breeder of Guilford, Mo., is now advertising a cracking good three-year old bull for sale. The sire of this bull is the noted Tempter 2nd and his dam is a fine big cow of Anxiety breeding that sold last year for $280. The bull now offered is a splendid individual, well bred, a proven sire and priced worth the money. Mr. Whiteford advises us that calves by him and out of mixed cows topped the St. Joseph market, selling for 45 cents above any others in their class. The price on this bull is $200 and the first check gets him. Here is an opportunity that should not be overlooked by any of our readers who are in the market for a bull of the right sort. Our readers will find Mr. Whiteford thoroughly reliable in every way and a pleasant man to do business with. Kindly mention this paper.

Red Polled Cattle and Spotted Poland China Hogs

Notice the change in the advertisement of M. L. Snyder, Polo, Mo. Mr. Snyder is now offering a choice lot of young bulls sired by Logan 13500 and by Knocker 28791. Mr. Snyder also offers Spotted Poland China bred gilts. If interested in any of the above stock we would urge that you write at once. Mr. Snyder reports a very active demand for his stock and adds that his customers were invariably pleased.

Belcher & Bennett Bros. Have the Top Sale of Missouri

An average of $89.50 was the mark John Belcher and Bennett Bros. hung up for their fellow breeders to shoot at in their annual Smooth Columbus Sale held at Lee's Summit, Mo., Saturday, February 19th. This was the top sale of the state and one of the top sales of the breed.

It will be recalled that last year John Belcher held the top sale of Missouri, and when it was announced that Bennett Bros. had purchased a half interest in Smooth Columbus, and that the two herds would be drawn on for this years sale offering much speculation was indulged in as to whether or not they would break last years record. The recent sale was the answer.

An exceptionally attractive lot of bred sows, all either bred to or by Smooth Columbus, a splendid crowd of breeders from Missouri, Kansas and Iowa, a perfect day, and the added fact that it was the auctioneer's—Col. Harriman—birthday, were the contributing factors that made this sale such a success.

The top of the sale was finally set at $275 after Sigel Brown, Reeds, Mo., and Walter W. Head, St. Joseph, Mo., had given each other a battle for the good sow, Meadow Queen. Mr. Brown made the last bid and thereby bought one of the best aged sows the writer has seen go through a sale in a long time. One of the real bargains of the sale was secured by E. E. Marlow & Son, Wellsville, Mo., wthen they purchased the splendid daughter of old A. Wonder, Fessie's Lady, for $172.50. Another good bargain was the outstanding daughter of Smooth Columbus, Big Belle, purchased by Bridges Bros., Slater, Mo., for $127.50. Sigel Brown was the heaviest buyer in attendance, with Walter W. Head a close second. Space does not permit more detailed mention of the individual buyers, but a complete list will be found below.

Col. R. L. Harriman was never in better trim for a corking sale and he and Col. Sparks deserve considerable credit for helping to hang up the record average of the state.

No. 1. E. E. Marlow & Sons, Wellsville, Mo. $172 50

NATIONAL DUROC-JERSEY RECORD Association Futurity for 1916

$400 for Spring Pigs as Follows:

Spring pigs.	1	2	3	4	5	6	7	8
Boars	$35	30	20	15	10	8	7	5
Sows	35	30	20	15	10	8	7	5
Litter of four	35	30	20	16	12	10	9	8

$50.00 trophy by Duroc Bulletin Co., for Premier Futurity Exhibitors.

The National Duroc-Jersey Record Association guarantees the above premiums and wants to promote a Futurity in every state, under the following conditions:

a. An appropriation of $100 to the Futurity Fund by the Fair Association where the show is to be held.

b. Twenty herds to be nominated in every Futurity at $5.00 each, and these nominations must be made by breeders of the state in which the futurity is held, or from adjoining states where there is no futurity show. Herd nominations close March 15, 1916.

c. A second payment of $1.00 will fall due June 1, 1916, on each litter from a nominated sow which it is desired to keep eligible in whole or in part.

d. A third of payment of $1.00 per pig will fall due on August 1, 1916, for each pig you desire to show.

e. All payments are due in cash on or before dates specified. Failure to make any payment when due forfeits all sums previously paid in and shall automatically declare any entry void and out of the Futurity.

f. All dollar payments when duly made on litters and individual pigs shall qualify each and every pig in each and every litter for exhibition in the Futurity Show. A nominator makes only as many payments as he deems advisable. There shall be no refund after an entry has been accepted as in the stakes, but nominators incur no future liability by making any payment and all nominations may be dropped at will.

g. All payments in this Futurity must be made direct to the National Duroc Jersey Record Association, Peoria, Ill.

Rules Governing the Futurity

1. Farrowing dates of spring pigs will conform with the rules of the Fair Association where Futurity is held.

2. A litter consists of four pigs of either or both sex, farrowed by one sow.

3. Should a nomination be made in a state which failed to comply with conditions to secure a Futurity, the nominator has the option of having the nomination fee returned or to continue payments for the purpose of exhibiting at a Futurity in an adjoining state. Not more than one Futurity will be provided for any state.

4. The litter payment due on June 1, 1916, must give the name and record number of the dam of each litter on which payment is made. Credit for payments will not be given unless name and record number of dam of each litter is given.

5. The individual pig payment due August 1, 1916, must give the name and record number of each pig on which payment is made. That means that each pig must be recorded before this payment is made.

6. It is understood that in order to be eligible to compete for prizes in the Futurity, each pig must be recorded not later than August 1, 1916. Registry certificate for each animal shown in a Futurity will be required.

7. An exhibitor can exhibit at only one Futurity and this must be in the Futurity in his state. Should the Futurity not fill in his state, he is permitted to show in a Futurity in an adjoining state.

8. Substitutions will not be allowed, but nominations are transferable up to and including the date of making the final litter payment to the extent that once nominated and properly transferred from owner to owner, and the payments duly kept up, any litter or any pig in any litter may be exhibited, irrespective of the number of times it may change hands.

9. Only pigs farrowed on or after the spring farrowing date adopted by the Fair Association where the Futurity is held, will be eligible to compete. Those farrowed before that date shall not be eligible.

10. Pigs nominated in the Futurity shall have the right to compete in all the regular classes to which they are eligible at the state fair where Futurity is held.

11. Judges as far as possible will be those selected to act at the fair at which the Futurity is held, but the Futurity premiums must be awarded by a Duroc-Jersey breeder, or a person directly familiar with the breed, and in all instances must be acceptable to the committee in charge of the Futurities; otherwise the committee reserves the right to place their judge in charge and place the awards in the Futurity show.

12. The Futurity show will be held before that of the regular classes.

13. Right is reserved by the National Duroc-Jersey Record Association to declare off a Futurity by reason of insufficient nomination of herds, to alter, amend and interpret these rules and conditions as it may see fit, and to make such other and further rules and regulations as may be necessary to the successful prosecution of this enterprise. In case of an insufficient entry being received and the stake being declared off in consequence, nominators will be so notified within ten days of the date of closing and nominating fees will be returned as received.

For any other information regarding the Futurity, write the National Duroc Jersey Record Association, Peoria, Ill.

Report of W. Z. Baker's Poland China Sale.

W. Z. Baker's annual sale of Poland China bred sows and gilts held at Rich Hill, Mo., February 1, opened the bred sow season, and as usually happens, the first sale was hardly up to expectations. However, the average of $36 was fairly satisfactory to Mr. Baker in view of the fact that he had listed a number of May gilts. The extreme cold weather prevailing at the time no doubt kept many local buyers away.

W. A. Baker & Son, Butler, Mo., topped the sale when they bought the show sow, Josie's Best, for $75. This same firm secured one or two other real bargains. S. E. Wait, Blue Mound, Kans., was the heaviest buyer, securing six head. Cols, Harriman and Gross conducted the sale. A partial list of the buyers follows:

No. 1. S. E. Wait, Blue Mound, Kans. $52.50
2. W. A. Baker & Son, Butler, Mo. 75.00
3. S. E. Wait 46.00
4. C. D. Smith, Lincolnberry, Mo.. 41.00
6. L. J. Petway, McKinney, Tex.. 70.00
7. W. A. Baker & Son..... 49.00
8. C. D. Smith 38.00
9. S. E. Wait 37.00
10. H. G. Requa, Butler, Mo..... 40.00
11. S. E. Wait 40.00
13. Roy Stokes, Butler, Mo..... 41.00
14. S. E. Wait 35.00
12. John Pharis, Appleton City, Mo. 42.50
15. Arthur Baker, Rich Hill, Mo.... 37.50
16. Joe Ferris, Adrian, Mo..... 36.00
17. Monroe Lasky, Butler, Mo..... 33.00
18. Arthur Baker 37.00
20. W. W. Cheverton, Rich Hill, Mo. 32.00

22. Wm. Olive, Rich, Hill, Mo..... 33.00
23. Lee Daniels, Rich Hill, Mo ... 29.00

Lockridge Averages $43.25 on 32 Head

The second annual sale of big type Poland Chinas held by Will G. Lockridge at Fayette, Mo., Thursday, February 17, attracted a fairly representative crowd of breders and farmers and resulted in an average of $43.25 on the 32 head sold.

This offering featured the blood of Mr. Lockridge's grand champion boar, The Giant, and the get of this sire was in keen demand. Mr. Lockridge did not have his sale offering fitted quite as high as buyers usually like, and this fact no doubt caused the average to drop considerably below what was expected. H S. Williamson, the veteran breeder, topped the sale on No. 0, a substitute sow, at $160.00. Mr. Lockridge purchased his foundation herd from Mr. Williamson a good many years ago.

Col. R. L. Harriman did the selling, and much credit is due him for the success of the sale. A representative list of sales follow:

No. 1. Duglas Sallee, Wheeling, Mo.$50.00
0. H. S. Williamson, Centralia, Mo.160.00
3. J. A. P. Garrett, Enon, Mo..... 65.00
4. A. D. Patterson, Fayette, Mo... 50.00
5. O. G. Lease & Son, Centralia, Mo. 42.00
6. C. C. Smith, Savannah, Mo..... 36.00
7. Bridges Bros., Slater, Mo..... 49.00
8. F. I. Wilbur, Fayette, Mo..... 36.00
9. Geo. Crowden, Fayette, Mo..... 38.00
11. J. A. P. Garrett..... 65.00
12. Milton Williamson, Fayette, Mo. 42.00
13. A. P. Samer, Pleasant Greek, Mo. 42.00
14. S. R. Marshall, Glasgow, Mo..... 40.00
15. M. S. Thompson, Kearney, Mo... 40.00
16. E. A. McKenzie, New Franklin, Mo. 34.00
17. Will Harvey, Armstrong, Mo.... 33.00
18. E. A. McKenzie..... 30.00
19. H. S. Williamson 30.00
20. E. A. McKenzie 32.00
21. S. R. Marshall 35.00
22. Joe Sartain, Fayette, Mo..... 30.00
23½. E. A. McKenzie 35.00
24. Robert Selmeyer, Glasgow..... 39.00
26. E. A. McKenzie 35.00
27. John Aholt, Fayette, Mo..... 38.00
28. E. A. McKenzie 36.00

JERSEY CATTLE

Breeders' Aberdeen-Angus Cattle Auctions

115 Head of High-Class Bulls, Cows and Heifers

85 Desirable Females--30 Outstanding Bulls

National Stock Yards Pavilion, Barn 5, East St. Louis, Ill.

Two great sales of highly-bred and desirable Angus Cattle. A great opportunity for all classes of buyers to supply their wants. Cattle that will suit the exacting taste of the breeder in search of the best stock available, or the farmer, or southern or western buyer who desires to raise the highest priced beef the world affords.

Wednesday, March 15th

at the above place **59 head,** consisting of **20 bulls and 39 females, from the herds of the following well known breeders: Stanley R. Pierce, A. A. Armstrong, S. Melvin, J. Garrett Tolen, A. Middleton** and the **University of Illinois,** will be offered. The offering represents such fashionable families as **Blackbirds, Trojan Ericas, Pride of Aberdeen, Queen Mother, Zara, Barbara** and other popular tribes. Never before in the history of the breed have so many high-class bulls been offered at this market. Every one is of serviceable age and many are top-notch herd-headers. Every one has much to recommend him as an eye-opener. Among the **39 cows** to sell are many splendid individuals, richly bred and of superior quality. Many have calves at foot, the others sell bred. Some are near calving. You will find plenty of show prospects awaiting your inspection.

Thursday, March 16th

Durrstine Bros., Scale Mound, Ill., will disperse their noted herd of Aberdeen-Angus cattle, consisting of **57 head—10 bulls and 47 females**—at the National Pavilion. Every animal in this herd, except one, has been bred and developed by Durrstine Bros., a record seldom equaled. The entire herd of 57 head has been produced from the **three cows they began with.** The offering is in the very pink of condition and buyers will not be disappointed. The following popular families are represented: **Westertown Rose, Westside Grace** and **Mina.** There will only be 10 bulls, all of serviceable age. A specially attractive bull to sell is the herd bull **Ernie 2nd of Greenwood,** a three-year-old Trojan Erica that weighs above a ton. He is a show bull of the first water and his get show him to be a great sire. Many of the cows are in calf to him. Some fine show heifers are in this consignment.

If you are in the market for some good Angus Cattle plan to attend these two sales and secure some of the bargains. For catalog and further information address,

Beginning with the Boiler

And ending with the last brushful of paint, there is not a questionable item to be found in any engine that the Nichols & Shepard Company build. Everything is of the best.

A GOOD TRACTION ENGINE

Is the unfailing result of this method. When we say that it IS good we are backed by the openly expressed opinion of thousands of users who know in every detail what a good traction engine should be.

THE USER IS SATISFIED

That every convenience, that every economy of operation, that every safety device that is necessary or practical will be found right where it belongs on a—

RED RIVER SPECIAL ENGINE

Five sizes and sixteen variations are built, ranging from 13-40 to 30-98 H. P. Wood, coal or straw may be used for fuel, the engine may be had in single or double cylinder, the mounting may be center or rear. No matter what your needs may be for agricultural traction power we make an engine that will fill the bill.

Send for a copy of the Home Edition of the Red River Special paper. You will find that someone in your immediate vicinity has tried with success a Nichols & Shepard Co. traction engine on every kind of work that a tractor can do. They have been pleased with the results and have written us to tell just how well it performed. There is a lot of experience condensed in these letters that may be useful to you. Ask for a Big Catalog at the same time. It illustrates and describes the power that will haul the mortgage off the farm.

Baker & Son Hold Successful Sale

W. A. Baker & Son, Butler, Mo., added another successful sale to their list when on February 18 they sold about forty head of Poland China bred sows and gilts for an average of near $50.00. This firm has been before the public so long that their annual sales are always looked forward to with a great deal of interest by breeders and farmers of Southwest Missouri and each year sees a widening circle of buyers. The top of the sale was $160, that price being paid by E. W. Thompson, Maysville, Mo., for the splendid yearling show gilt, Lady B. Dr. Daggett, Crane, Mo.,, was a good buyer of the choicer lots. Walter W. Head, St. Joseph, Mo., who is founding such a high class herd, was also a good buyer. E. D. Frazier, Drexel, Mo., paid $105 for a spring yearling, No. 7, in the catalog.

Col. R. L. Harriman did exceptional work on the block and was given splendid support by Col. Robbins in the ring.

No. 1,	E. W. Thompson, Maysville, Mo.	$160.00

Durocs Sell Well at Maryville

An average of $37 was made on 42 head of Duroc bred sows and gilts at the Dowden & Partridge sale at Maryville, Mo., February 11. While the average does not represent the real merits of the offering, Messrs. Dowden & Partridge were not discouraged. Better conditions would have meant an increase in the average. Local support was splendid at this sale, and this is a branch of the sale business upon which hinges the success or failure of any sale. Charles May, Roca, Neb., bought the top sow of the sale at $65 and she was undoubtedly a bargain.

The fact that this herd is nominated in the Missouri Duroc Futurity for 1916 proved a good advertisement for them.

Col. W. M. Putnam, Tecumseh, Neb., sold the entire offering and worked hard. The fieldmen and Col. Hosmer, the local auctioneer, kept the crowd bidding promptly. The weather was bad. Following is a detailed report of the sales:

No. 1,	Chas. May, Roca, Neb.	$65.00
No. 2,	M. R. Hiles, Burlington Junction, Mo.	56.00
No. 3,	C. W. Hillsenbeck, Maryville, Mo.	45.00

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

Red Lights

Some time ago I happened to be changing trains at a little station in central Missouri when one of the loungers suddenly greeted a newcomer by saying, "Hello, Sheriff! What's up?" "Oh, there's been a killin' up the road and I am after the feller that done it," dryly answered the sheriff. "You don't say," remarked the other, in some degree of astonishment —and then he added, "Well, I don't believe I'd want your job because things like that would get on my nerves." "No use lettin' 'em git on your nerves," replied the sheriff, as he slowly filled his pipe. "A sheriff's got to figger that there's goin' to be a certain number of killin's—so there ain't any use in gettin' excited about it"—and with that the subject was changed to the various county candidates and the probable winners in the primaries.

I have thought over the Sheriff's words a number of times since then—the proposition that there must be "a certain number of killin's"—and that there wasn't any use in getting "excited" about it, etc. That his philosophy is true, of course, there is no question—for, from the first gray dawn down to the present hour there has been crime and so I guess there will continue to be until the great Trumpet blows on the Judgment Day. And yet, what a sinister prophesy in these laconic words of the Sheriff? If there must continue to be a certain number of killings, then, likewise, it means that a certain number of men who are at this hour at peace with the World and who are not afraid to look their friends and the law boldly in the face will, at some time in the not distant future, be brought within the shadow of the awful and terrible crime of murder, either as its victims or its perpetrators—and it is in the hope that the significance of such a dread possibility may be impressed upon those who read these lines that I refer to it on this page, which I so much prefer to devote to the bright and beautiful things of life rather than to its sorrows and shadows.

Do you know, my friend, that ninety-nine out of every hundred murders wouldn't happen if, within thirty minutes after they have occurred, the men responsible for them could retrace their steps? Look at the haggard face of the "prisoner at the bar" in any crowded court room—or look into the dull eyes of the convict in his prison garb—deprived of liberty, family and friends—and draw your own conclusions. And then, think of the heartbroken mothers, fathers, wives, sisters, brothers and little children who are often compelled to bear the sorrow and disgrace to the end of their lives? And how trivial are the causes which usually lead to this awful crime. A fancied insult, a dispute over a few paltry dollars, or a wrath which leaps like a wild beast from the bottom of the cup that cheers—and the terrible thing is done and all the tears and vain regrets of the years that follow can never wipe out the red stain which a moment of unreasoning anger brought into being.

So, my friend, if you are nursing a secret grudge against somebody, think it over and resolve to get it "out of your system" at the first opportunity. Go to him with a smile and say, "Let's be friends and start over again." Hold out your big, warm hand and make him shake it—and if you will do this and really mean it, it doesn't matter how much poison may be lurking in his heart, he will surrender. What difference does it make, even though you know you are in the right? Isn't it better to meet him more than half way rather than nurse a smouldering hate which may suddenly blaze forth in red anger and ruin the life of yourself and your loved ones? If every man in this great state of ours who is treading the path of danger at this moment would fight it out with himself in this way we could disprove the logic of the Sheriff that there must be a "certain number of killin's"—and think of the anguish and the tears and the heartaches which would thus be spared? Every path of danger in this World has its "red light" signals—but too often we refuse to see them until it is forever too late.

SUDAN GRASS IN MISSOURI

Tests of Sudan grass by the Missouri Agricultural Experiment Station during the last two years indicate that this new crop will be of value to Missouri farmers especially in the southern part of the state. Seed may be secured from any reliable seedsman but it is well to take the precaution of buying northern grown seed so as to avoid the possibility of introducing Johnson grass.

Sudan grass is a tall, rank growing, annual grass closely related to the cultivated sorghums and resembling Johnson grass. It differs from Johnson grass, however, in not possessing the heavy root stocks or underground stems which make Johnson grass so difficult to eradicate in those regions which are well suited for its production. The plants average from 3 to 5 feet in height when drilled or broadcasted and have stems a little larger than a lead pencil. If grown in rows and cultivated, it reaches a height of from 6 to 9 feet on good soil with a corresponding increase in the size of the stems. When planted thinly it stools very freely, sometimes producing as many as 100 stems from one crown.

Like the other sorghums, Sudan grass does best in a warm climate. It should not be planted until all danger of frost is past and the ground thoroly warmed. It is decidely drought resistant, which makes it well suited for the semi-arid regions of the southwest. It is also being grown with success in the more humid regions but it has not attracted as much attention there as in the drier sections where there are not so many other good hay plants. Two cuttings are usually made and under very favorable conditions sometimes three or four. It has rather wide adaptions as regards soil, growing successfully on almost every soil from a heavy clay to a light sand. It does best on a rich, well drained loam.

Two methods of seeding are practiced, broadcasting or drilling solid, or drilling in rows to be cultivated. An ordinary grain drill may be used and the seed covered from one-half to one inch deep. Where drilled in rows a sufficient number of the holes are stopped up to put the rows the proper distance apart. Where an ordinary corn cultivator is to be used, the rows should be from 36 to 42 inches apart. Where seeded broadcast from 20 to 25 pounds of seed to the acre are required, while seeding with a drill requires about five pounds less. If seeded in rows 4 to 5 pounds is sufficient.

It is customary to cut it for hay just after full bloom and to cure in light windrows and small cocks. It may also be harvested with a binder and cured in shocks. Where grown for seed it is usually harvested with a grain binder when the first heads are fully ripe.

In Missouri, Sudan grass should be considered a hay grass of much the same use on the general farm as millet.

It will generally give two cuttings and will yield from two to four tons of good hay. In feeding value it is similar to timothy hay, millet and Johnson grass.

J. C. Hackleman,
Missour College of Agriculture.

FAVORS A COOPERATIVE PACKING PLANT

To The Missouri Farmer:

I am so much delighted with your plan for the farmers to organize a cooperative packing plant and to sell direct to the consumer that I thought I must write and encourage you to go ahead with your fight. It is the duty of every farmer as well as the consumer to give you his support in this matter.

I think your plan the most reasonable of any I have seen. It will be hard to get the farmers of the state to hold together long enough to win the fight but as soon as they begin to see what a benefit it will be to them they will forget their differences and hold on in a true cooperative spirit. If the plan is carried out successfully it seems to me that everybody would be benefited by it unless it be the packers and the butchers. One advantage in the business getting under the cooperative control of farmers would be a more uniform price for meat animals and less uncertainty in the risk of raising and fattening hogs and cattle. The way it is now we can not tell when we start feeding an animal whether it is going to be a gain or a loss by the time it is finished for market. There is no question but what the packers bear the market just at the time when most of the hogs and cattle are ready to go and the farmer can not help himself for it is very expensive to held stock long after they are finished. And anyway, the farmer has his obligations to meet regardless of price and he can do nothing but sell at the price offered.

The control of markets by others I think is the one great cause why so many farmers have been losing money and why so many are going to town. When we are organized and get a stable market I believe you will see conditions improve so that these men will flock back to the farms faster than they left them. Why should not farmers know something about the prices they are to expect for the stuff they produce and why should they not have a right to demand a certain profit each year just as the merchant does? As it is now one kind of stock is high one year and some other kind high the next year and this keeps the farmer guessing and changing methods of farming and I think is a reason often for the farm being sold under mortgage. City people blame the farmers for the big prices to them of farm raised products but if they could know on the other hand just what the farmer has received for these same products and if they could furthermore, be made to understand that the farmer is working on small profits and oftentimes for no profit at all—even at a loss—and that the average farmer must be both frugal and sikllful to make a living, then I think the city man would acknowledge the just cause of the farmer.

I appreciate the fight The Missouri Farmer is making in our behalf and think we farmers should take a pride in supporting it and I truly hope some such plan as the paper is working for may be carried into successful operation in the near future.

H. A. Steinhoff,
R. 1. Cape Girardeau, Mo.

I Will Tell You How to Make Poultry Healthy, Make Hens Lay, Make Chicks Grow

Now that mating time has arrived, it's up to you to see that your poultry get a tonic and internal antiseptics to make them vigorous and free of disease. *Therefore, feed Pan-a-ce-a.*

In that condition your hens will lay better, you will get more healthy, fertile eggs and the chicks will stand a better show of reaching maturity. *Therefore, feed Pan-a-ce-a.*

And, before the hatches come, I want to warn against gapes, leg weakness and indigestion, for these ailments are responsible for half the baby-chick losses. *Therefore, feed Pan-a-ce-a*—it will save you these losses.

My Guarantee
So sure am I that Dr. Hess Poultry Pan-a-ce-a will help make your poultry healthy, help make your hens lay and your chicks grow that I have told my dealer in your town to supply you on condition that if Pan-a-ce-a does not do as I claim, return the empty package and get your money back.

Dr. Hess Poultry PAN-A-CE-A

It's a Tonic—Not a Stimulant

Here are a few of the valuable ingredients in Pan-a-ce-a to meet the requirements of your poultry which I have just stated: *Nux Vomica*, a nerve tonic; *Carbonate of Lime*, a shell former; *Hyposulphite of Soda*, an internal antiseptic; *Quassia*, an appetizer; *Iron*, to enrich the blood, and other valuable ingredients, all well known and recommended by the highest medical and veterinary authorities.

Perhaps the strongest argument in favor of Pan-a-ce-a is the fact that it has been on the market for 22 years and is growing in favor each year. Read the guarantee in the right-hand panel—that is your protection. There is a Dr. Hess dealer in your town, a man whom you know, a man who stands back of my guarantee and will return your money if Pan-a-ce-a fails to make good. 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail, $2.50 (except in Canada and the far West).

DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Stock Tonic
25-lb. pail, $1.60; 100-lb. sack, $5.00
Why pay the peddler twice my price?

Your stock need this tonic now to harden and condition them after the confined heavy feeding of winter. There's nothing better to put horses in trim for hard spring and summer work. Milch cows need it just now to prepare them for the heavy milking season ahead. Dr. Hess Stock Tonic makes all stock healthy, keeps them toned up and expels worms. Sold under money-back guarantee. 25-lb. pail, $1.60; 100-lb. sack, $5.00; smaller packages as low as 50c (except in Canada, the far West and the South). Send 2c for my *new* free Stock Tonic book.

Dr. Hess Instant Louse Killer

Killslice on poultry and all farm stock. Dust the hens and sprinkle it in the nests, or, if your fowl are provided with a dust bath, sprinkle Instant Louse Killer in the dust bath every other week—the hens will do the rest. Also destroys bugs on cucumber, squash and melon vines, slugs on rose bushes, etc. Comes in handy, sifting-top cans. 1 lb. 25c; 3-lb. can 60c (except in Canada and the far West). I guarantee it.

Gilbert Hess M.D., D.V.S.

'OLUME VIII | MARCH 15, 1916 | NUMBER 6

The War and The Farmer

By William Hirth, Publisher

That the great European war means at we are living in a different world om the one which we knew prior to ugust, 1914, is apparent to every inking man and the time has come re in the United States when this ct should sink deeply into the public nscience. In saying this I mean not erely that the world's territorial and onomic map will be changed across e seas—but that here at home the merican farmer and business man ill have to face new and strange contions to which they cannot too soon ljust themselves—for upon the mander in which we meet these changed tuations will depend very largely the ture well being of our agricultural d industrial classes.

And this is true regardless of whether the final victory in the bloody ama rests with the Allies or with e Central Powers. From time of ind, England, Germany, France and ussia have been our best customers. hey have annually bought hundreds millions of dollars worth of our surus wheat, cotton, beef and pork and her farm products as well as hunreds of millions of dollars worth of e output of our factories—and staging as they will be when the carnge ends under a war debt without recedent in history, two things in my dgment are assured: First, that ice peace comes they will resolve to y as little as possible outside their vn countries and secondly, to sell as uch as they can to the balance of e world—for only in this way, rough favorable trade balances, will ey see any chance of gradually unading the tremendous debts which ey have incurred.

Our Good Fortune Temporary

That for the time being the war has ought a degree of prosperity to the S. is true—and yet in my judgment has not been a healthful kind of osperity nor is it in any sense peranent. To begin with, the lions are of it has gone to the manufacrers of war munitions who have ofited to the extent of hundreds of illions and about the only benefit hich has accrued to the general pubc in this connection is that it has ven employment to many thousands laboring men. The railroads too ve derived increased revenues from uling these munitions and to this is iefly due the increased earnings hich many lines—especially those in e East—have shown during recent onths. Again, at the beginning of e war, European investors owned mewhere between two and three bilon dollars worth of American bonds d securities and with a balance of ade in our favor amounting to more an a billion dollars—and with loans r almost as much more having been being floated in this country—it eans that Europe is squaring or will uare these accounts largely by reirning to us these foreign held bonds and securities and thus we will emerge from the final conflict with the satisfaction of knowing that we have very largely, if not altogether, wiped out our debt to the European money lenders. But this benefit is only National or general. If, for instance, the American farmer who is responsible for the lions share of the great balance of trade which has resulted in our favor, had received his just share of profit on the things he furnished to the European armies the situation would be much more wholesome—but instead of this being true the manipulators of market conditions have robbed him unmercifully and compelled him not only to lose heavily upon his cattle and hogs but even his wheat and cotton have paid heavy tribute to a gang of conspirators who saw their opportunity and hastened to make the most of it.

As To The Future

Now what is likely to happen in the future? As we have already said the policy of the European nations after the war will be to buy as little and sell as much as possible to the balance of the world in order to rehabilitate their depleted finances. If this supposition is correct, then it means that the American manufacturer will face the hardest competition he has ever known in fighting for his share of the worlds trade while it means on the other hand that the people of the stricken nations will try as never before to subsist on the fruits of their own fields—and this is certain to bring about a greatly decreased demand for surplus American wheat, beef, pork and other export farm commodities. In rebuilding her railroads, canals, etc., and the other havoc wrought by the war, Europe may have to patronize our steel mills—but rest assured that through the forced economy imposed by the tremendous sacrifices which the rich and poor have already made and in order to pay the heavy taxes which are inevitable in the future for many years to come, the breakfast and dinner tables of European families are going to be a more frugal affair than Europe has known in many a year—and I shall be agreeably surprised if this does not mean an enormously diminished demand for the wholesome products of the American farmer. In short, the forced expenses of the war have crippled the buying power of these nations for years to come and we cannot expect to escape our share of the depression which is certain to follow—and the sooner the American farmer and manufacturer realize this fact the sooner they will be in position to shift their sails to the wind—once the war is at an end and we find ourselves face to face with the new conditions. Had the farmer received for his surplus beef, pork, wheat and cotton what he was justly entitled to since the war began he would be in better position to stand the period of readjustment which is certain to come—but instead, he faces the future in a condition of weakness which has never been more acute than at this hour.

The Remedy Ahead

If I am correct in this analysis, then how should we trim our sails for the future? Here at home we must build up factories which will be more able than ever before to meet the competition of Germany and England in the world markets. We must stop shipping raw materials to Europe and manufacture them into finished product ourselves—for only in this way will we be able to hold the "whip hand" in the fight for world commerce. Why should we sell the raw cotton to England and Germany and then later on buy back from them the finished cloth? It has always been a stupid policy and one which has reflected no credit upon our boasted Yankee shrewdness. Once the war is over, Europe will be in the market for raw materials—for not producing enough of them herself her only chance will be to buy them elsewhere and once finished, sell them wherever opportunity offers. In short, we must try to build up here in the United States our increased industrial activity which will bring in its wake an increased demand for our farm products and thus, by this means, enable the farmer to sell at home a large part of the surplus which has been going to Europe—and only by so strengthening an increased industrial activity which man who wants to work will have a job can this be done and only by a larger conversion of our raw materials into the finished product will this opportunity be offered. If our Captains of industry would watch the antics of war stocks in Wall Street less and study the horizon of the future more we would the sooner arrive at a solution of the grave problems which confront us.

The Farmers Chief Problem

But while the chiefs in our industrial world are facing the greatest test of acumen which they have ever undergone and while an increased demand for the home consumption of farm products will largely depend upon how these men meet the coming crisis, yet the farmer likewise has the greatest task of his career ahead of him—and never was it so important that he realize this great truth as to day. First, and above everything else, there must be an end of the "hit or miss," "go it alone policy." In the struggles of the future it will be more necessary than ever before that farmers shall reseue themselves from market conditions in which a gang of manipulators can fix the price of farm products—and as we have pointed out time and again in recent months. this gigantic task can be accomplished only through farm organization which reach from the school district up to the county, state and finally the Nation. Are we equal to the task? Up-

JUST A THOUGHT

In order to inspire better farming methods, why should we not bring into being a "Roll of Honor" among farmers? Why not get up what might be termed the "Ten Commandments" of Better Farming and then let those who faithfully subscribe to and carry out these commandments organize themselves into a sort of society and by their precept and example stimulate others to do likewise in their communities? Suppose, that among other things, a farmer seeking membership in this society would agree to do certain things to improve his soil each year—to use none but pure bred sires—to permit no piece of machinery to remain from under shelter while not in use—to practice strict quarantine against hog cholera or any other contagious live stock disease on his premises—to spray his orchard if he has one—to feed balanced rations to his live stock—to grow at least a small patch of Alfalfa if he has suitable soil—to give his buildings a new coat of paint at least once every five years and to supply his home with such household conveniences as his means permit?

The above are merely some of the things which I think should be included in the "Commandments" and I believe that once each year every member should be required to furnish a written report to the Secretary of the Society and that his continued membership should be conditioned upon his performance. I think every member should have a "red barn"—a big one if possible—but red in any event and that on the side or end of it there should be painted a neat "official emblem" showing that he belongs to the "Roll of Honor." Don't you think that if farmers agreed to live up to such a "Confession of Faith" their farms would soon become marked in every community? Don't you think people would soon get so they would count these "Roll of Honor" farms as they looked out of the train windows? Back of my thought is the longing to put a little more "pride" back of the farm—to arouse a little more enthusiasm and to introduce a little more wholesome rivalry among farmers themselves. In any event, I will be glad to hear what our readers think of it.

The Publisher.

on this every thing depends. When we are able to compel a fair price for what we produce—when we distribute among the over six million farmers in the country the hundreds of millions of tribute which now go into the pockets of the few—here and here alone leads the path of deliverance from bondage and from this source alone must come the strength which will enable us to hold our own against the new conditions to which all signs point so unmistakably at this time.

Better Farming Methods

In the meantime, much as farm organization is the overshadowing question of the hour, we must never forget that the time will never come when better farming methods will not deserve to be an indispensable part of the creed of every thinking farmer. If we have been lax in farm organization we have been equally lax in the application of those improved methods which will cheapen the cost of production. It is of tremendous importance to compel a "square deal" in the market place—but it is of equal importance to fight the battles of the fields and feed lots intelligently and we therefore hope that the slogan of the hundreds of Farmer Clubs which are now forming throughout Missouri may be "Honest Markets" and "Better Farming"—for the two are of equal importance and deserve to be kept constantly in view. Even as the American manufacturer will face a fiercer competition in the world markets than ever before, so the American farmer, too, will have to face an European farmer determined not only to supply the needs of his own country from this time forward but to have something left for export. In this test of strength economy of production must be a vital factor in our calculations. In short, we have at last reached a point where in meeting the crisis which confronts the American farmer from numerous angles, makes the hap hazard policies of the past suicidal. At last we are face to face with conditions which it will require brains as well as muscle to solve. In some future article I trust to be able to touch upon the importance of an adequate merchant marine—for the time has come when we must have American ships in which to ship American products and goods—when we shall no longer be at the mercy of foreign ship owners who have the power to discriminate against us as their own selfish interests direct.

A BETTER SYSTEM OF MARKETING IS NEEDED

It is a common notion that the farms in this country are growing smaller, but the fact is they are getting larger on the average in the United States. The tendency is toward a more extensive system of farming and the increased use of labor saving machinery. Intensive agriculture on some of the poorer soils of New England and in the Atlantic States is giving way to extensive agriculture. According to the report of the government commission, four men are now producing on the farm with machinery what it formerly required fourteen to produce.

Along with the increase in the size of farms and the use of machinery, has come an increase in tenantcy. More and more the best lands are being purchased by capitalists and tilled by tenants. No one can tell, of course, how far this may go.

With agricultural lands capitalized at from three to five per cent and with money commanding from six to eight per cent, the natural tendency is for the best land to get into the hands of the capitalists. Good agricultural lands have always been considered the safest form of investment and on this account they always have been capitalized on a very low rate of return.

A Lesson from Denmark

A generation ago the farmers of Denmark were largely tenants. The government found it necessary and still considers it good policy to lend its credit at a very low rate of interest, and with long deferred payments, to the small farmer to enable him to buy land. As a result nearly nine out of every ten Danish farmers own the land they till, while in this new country of ours, with Uncle Sam still giving away land, four out of every ten American farmers are tenants. Recently Great Britain entered upon the policy of taxing the absentee landlord out of existence and lending government credit to the Irish peasant to buy a farm. Under this system Ireland again is taking her place among the prosperous and progressive people of the world.

It may be that we are not at the beginning of any such a system of landlordism and tenantcy as has been the curse of many older countries, but everything indicates that we are. Shall we have the foresight to establish better systems of rural banking and rural credits than we now have and better systems of marketing and distributing the material produced on the farm, and in this way stop the growth of monopoly in agricultural lands? Or, shall we let the system develop naturally as it has in Europe and later be forced to resort to the methods adopted by European governments?

At St. Joseph, Missouri, recently there was a movement among the business men to extend credit to young men of limited capital, but with energy and intelligence, to encourage the development of small manufactories. It is a fine spirit, a constructive policy. I asked if it had occurred to them that it was just as important to get behind the young men in the country who wanted to buy a farm. Apparently they had not looked the proposition through that far and had not seen the relation it had to the development of St. Joseph and the state.

Local Markets Must Precede Intensive Agriculture

We need to pay attention to some other things before we can establish intensive farming in Kansas. One essential is better local markets. We cannot develop intensive farming and ship materials long distances and depend upon foreign markets. As we build factories in Kansas and develop it any more rapidly than we develop the factory. A campaign to build factories in Kansas must precede intensive farming.

Why should we continue to send money to other states to support their industries? We should develop manufacturing in this state to give employment to our labor and keep our money at home. The insurance business of Kansas should be done with Kansas capital.

There is great interest at the present time in all movements looking toward improving the methods of getting our products from the farm to the consumer. Never did it cost so much to market our food supplies as now. The farmer is more interested in how he is going to sell what he produces to good advantage than he is in producing any more, which he thinks he would be forced to sell at a lower price. You can interest him much more quickly in a discussion pertaining to marketing than you can in one pertaining to increasing his output. He even thinks of limiting production in order to be able to market his wares to better advantage.

Frequently fruit and other perishable products rot in the field in one locality, while people not far away are hungry for these products, and are willing to pay good prices for them.

Often a central market is so completly glutted with perishable products that additional consignments will not sell for enough to pay the freight and commission, while other markets are short on these materials.

The waste due to improper distribution of our food products is enormous and might be largely saved if the producer and consumer had all the help from the state and nation that it would be profitable to give them.

Crop Reports are Inadequate

At present the country's crop reports are inadequate, the results are not sufficiently detailed and complete to form a trustworthy basis for buying or selling crops.

The system should be extended to include a careful consideration of the demand as well as of the supply. The consumer has as much right to information showing where to buy to the best advantage as has the producer in his selling operations. Both of these are entitled to such knowledge of the crop situation, of the food supply and of its distribution as would be a safe guide in selling or buying. This knowledge our present crop reporting system does not provide. That is to say, it does not include sufficient detail to help the farmer much in deciding whether to sell his wheat from the thresher or hold it for an advance in the market. It does not tell the peach grower, where the market is glutted, where disaster would follow the consignment of perishable products. It fails to point out where his products are needed and where a good price can be obtained.

Speaking more specifically, the crop reports do not involve a sufficiently accurate and detailed consideration of distribution of supply and demand to tell the consumer accurately whether to buy in anticipation of an advance. They do not give information upon which a consumers' league in a city, for instance, can touch quickly the point of largest supply and thereby serve two good purposes: giving the farmer a good market and cheapening the food to the consumer. But the large dealer and the speculator supplement the public crop reports, and this with their expert knowledge of the field of marketing, and the facilities for storage, and ample capital and credit, enables them to take advantage of a surplus in one part of the country and a shortage in another. They can store food stuffs when those food stuffs are cheap and thereby reap a benefit from large supplies which the consumer should enjoy, and a benefit from a shortage which should go to the farmer.

These observations are not in criticism of federal or state departments of statistics. They mean, merely, that the public has not been interested sufficiently in marketing and distributing to provide means necessary to do this work as we now know should be done.

—Excerpts from an address by H. J. Waters, president Kansas Agricultural College.

[This address made to Kansas farmers is equally applicable to Missouri farmers. Two points in President Waters' address needs emphasis. If Denmark can change a system of landlordism to landownership by a rural credit's plan why cannot we do it in Missouri?

The other point is the inadequacy of crop reports. Last year the farmers of the United States lost millions of dollars because the government report on wheat failed to show that somewhere from 100,000,000 to 150,000,000 bushels of winter wheat was so damaged that it was not fit to mill and should not have been counted as wheat. So far as the wheat market is concerned, sprouted wheat is not wheat at all—it is only stock food. But the government report seems not to have found that out yet.—Editor.]

FORTY FEEDS PER SHOCK

There are, approximately, thirteen shocks, sixteen hills square of corn per acre, and if according to government experiments, thereon is generally, one ton of silage per five bushels of grain, an acre yielding a trifle more than fifty bushels will make from ten to twelve tons silage, and a shock will be 1600 lbs. or more of silage, which fed at the rate of forty pounds per day is a feed a day for forty days.

Most people agree that it costs very little more to silo an acre of corn than it does to cut, shock and haul in all kinds of weather and mud, but they have discovered no way whereby one shock of corn and the fodder will make forty feeds. Of shock corn the greater part of the stalk is wasted; in silage 95 per cent is eaten. Allowing a wide margin for cost of filling, etc., corn made into silage makes about one third more feed. For example: 45 bushels corn on the stalk is worth 60 bushels in the silo.

The general opinion is, put the lightest, no account corn, in the silo, but that can be proven an error. From tests it has been shown there is but a small percent more grain per

on of stalk on fifty bushel corn than n twenty bushel corn, generally.

Corn that will produce fifty bushels as a tall heavy stalk, while the fifteen or twenty bushel corn has a short, small stalk. The stalk is usually in proportion to the grain. It costs more to handle a ton of light corn and the silage is not so good, for better fodder makes better silage. You can't take out good silage unless you put it in the silo.

Pam Grinstead, Pettis Co., Mo.

THE DAIRY COW AND THE FARMER

It has been well said, "No matter how much money a man may make through farming, if during his years of control the land has become impoverished he has not been a successful farmer." Therefore, the growing of all kinds of live stock on Missouri farms, should be encouraged. Besides the added profits from feeding our farm products the soil's production is assured. Raising any kind of farm stock is profitable, if properly handled, but in order to get the most out of his stock raising, the farmer should choose the kind of stock best adapted to his farm and community.

Missouri today has approximately 700,000 cows distributed over 277,000 farms. These cows produce more than 30,000,000 worth of butter fat annually. This does not include the increase of the herds, nor the value for feeding of skimmed milk. Add to this the benefit the soil is receiving each year from this number of cows, and it is easily seen that dairying is among our important industries.

That interest in dairying in Missouri has increased is evident by the fact that a few years ago, cream cans were uncommon, while now at every railway station, cream cans are loaded and unloaded daily. There are reasons, however, why the Missouri farmer is not getting what he should out of his dairy work. The average man who owns cows does not specialize sufficiently to realize the vast difference in cows. He keeps cows as a side issue and too often does nothing to improve his herd nor increase his production.

When we consider that the average cow produces less than 150 pounds of butter fat per year, while the champion cow produces over 1200 pounds of butter fat per year, it is easily seen that our average is too small. For every 5 pounds of butter fat we could increase the average output of Missouri owned cows, it would mean a million dollars added to our dairymen's wealth annually, and the many large records compared with our average records, surely convinces us that it is well within the range of possibilities to increase our wealth from dairy sources several millions annually. Better breeding, more and better feed, and getting rid of the unprofitable cow, will surely get this result.

While it has been mentioned that dairying is profitably followed on high priced lands, it must be remembered that such lands are usually close to good markets for dairy products. In many cases the advantages of favorable shipping facilities enables the producer to ship whole milk and sweet cream, thus giving him the best market for his product, and an increased profit over his neighbor, not so well located. In dairy sections, however, this disadvantage is largely overcome through the cooperative creamery or cheese factory.

Where many people are specializing on one thing, their interests are common, and it is but a short time until they become organized for the purpose and with the effect of solving problems that would, without organization, go unsolved. Where communities are specializing in the growth or production of anything, for which there is demand, buyers are soon attracted and profitable markets easily established. To illustrate, take the dairy industry as it exists in Missouri today. Most of the cream produced on Missouri farms is sold to cream agents or buyers for large plants, called centralizers. These agents receive 2 cents for each pound of butter fat contained in the cream they buy. It costs 1½ cents to 2 cents more per pound to ship and handle it. This is necessary, because there isn't sufficient development in dairying in the sections cream is shipped from, to maintain a creamery. With a cooperative creamery close by and the product of sufficient cows to keep it in operation, the farmer could not only save the 3 to 4 cents per pound in commission and cost of shipping, but would receive his share of the profits from his butter fat, when made into butter, amounting to at least 20 per cent more or 6 cents per pound on 30 cent butter, less the cost of operating the creamery and finally receiving 6 to 8 cents more per pound for his product than under the present system of marketing, that largely prevails in Missouri.

The annual report for 1915, of the Farmers Gilt Edge Creamery, a cooperative creamery at Owatonna, Minn., has just reached this office. It shows the patrons of this creamery received $76,629.70 in cash for butter fat and received an average of 34.53 cents per pound for same. The cost for making butter was .0129 cents per pound. In the same report it shows that for the year 1895, patrons received an average of 18½ cents for butter fat and a total of $18,638.25 in cash. A pretty good gain for the twenty-year period.

Six to seven hundred cows will furnish enough milk to start a cooperative creamery and if properly managed, will in a short time, have the product of double that number. One thousand good cows should produce from $6000 to $7000 worth of butter fat per month. Figure the increase in the herds, the value of skim and butter milk for feeding, and the increased richness of the soil, and I doubt if any enterprise, with no larger investment, would prove more profitable to the merchants, and bankers, nor do the community more permanent good.

Bankers and merchants are realizing this in several states, notably Wisconsin, our greatest dairy state, producing over one hundred million dollars worth of dairy products annually, having more than 1000 creameries and over 2000 cheese factories. Many places have loan funds; committees are appointed to purchase cows on orders for farmers; payments are usually made and balance paid from products of the cow, thus the cow pays for herself, and the community is permanently benefited at a nominal cost, if any. The Bankers of southern Illinois recently stated they were ready to loan $250,000 to their farmers and dairymen, with which to increase their dairy herds.

A short time ago, a banker in Creston, Iowa, on checking the business done through his bank by a local firm, found that $60,000 had been paid out by this firm for dairy products in one year. He realized the advantages of silos, and proposed that to the first twenty farmers living in the country, making application to that bank, would be furnished sufficient money for one year without interest, with which to build a silo provided he owned 80 acres of unincumbered land. In explanation the banker stated that any enterprise doing that amount of good in a community was entitled to his financial and moral support.

We talk a great deal about better dairying, and through the various activities, such as Institute lecturers, of the State Board of Agriculture, the work done by the Dairy Department of the State Agricultural College, and the Farm and Dairy Journals—many reliable men become convinced that they should change their methods, and *would* if they had financial aid. At such times they do not need dairy speeches, as much as they need the help of the banker and merchant.

I am often asked about markets for dairy products, and if there is not some likelihood of exceeding the demand. Eighty-five per cent of the milk supply of St. Lous comes from Illinois, and a large percentage of Kansas City supply comes from Kansas.

All sections of the United States are not adapted to dairying and it takes most of the milk produced in the eastern states to supply the demand for whole milk, in the densely populated centers. Six states, namely, California, New York, Michigan, Wisconsin, Iowa and Minnesota, produce 64 per cent of the manufactured dairy products of this country. During the year 1914, 7,200,669 pounds of butter and 55,477,044 pounds of cheese, were imported from other countries, while we exported 3,687,657 pounds of butter and 3,797,450 pounds of cheese. The cream imports amounted to 2,229,499 gallons and the milk and condensed milk imports totaled $283,084.00. So, with our rapidly increasing population, it will be many years before dairying is overdone in this country.

E. G. Bennett,
Missouri State Dairy Commissioner.

Elwood Fence

A perfect hinge joint is formed at every second cable, making an elastic, long-life fence yet sufficiently rigid to prevent sagging. Made of tough, springy steel with a thick coat of galvanizing that adds to appearance and resists weather.

American Steel Fence Posts—cheaper than wood and more durable. Last a lifetime. *Sent Free*—write for booklet on how to set posts and erect fence. Every farmer should have it.

Feeding For Profit

HOG PROFITS depend on Hog Feeding. CORN PROFITS depend on Corn Feeding.

Feeding Corn is like feeding hogs.

The most profitable hog—200 pound hog at six months—is secured by feeding a balanced ration for big gains, good quality and early maturity.

The most profitable corn crop is one yielding eighty to ninety bushels per acre of early maturing, sound ears. This is obtained only by feeding the crop with plenty of a balanced plantfood ration (fertilizer).

Write us for free information on crop feeding.

Profit from Every Hill

International and C B & Q Planters

NEXT in importance to good, tested seed, every authority on corn raising places good planting. Evenly spaced hills; the same number of kernels dropped in each hill; even depth of planting; a reliable foot drop for finishing the field—these are the features demanded of a planter by every careful corn raiser.

This is the standard to which the builders of **International** and **C B & Q** corn planters work, and excellent planting is the result. Note, first, the substantial frame and wheels—the foundation of the machine. Then see how simple are the arrangements that enable you to drop 2, 3, or 4 kernels in every hill, or to drill in your corn with accurate spacing between the kernels. The use of an **International** or **C B & Q** corn planter gives you assurance that every hill of corn on your farm will produce its full share of corn profit.

Try one this year. Ask the local dealers, who handle these machines, to show you their good points in detail, or write to us for complete information about reliable **International** and **C B & Q** corn planters.

OUR GREAT FARM WASTE

The high prices of potash and acid phosphate at this time are causing much concern among farmers who depend upon commercial fertilizers to supply these constituents for the successful production of their crops.

If the farmers of this country had always fully appreciated the true value of farm manure, and used it on their land, the present situation would be much less acute. The annual loss of fertilizing materials is enormous in this country through careless handling of manure. This loss can be easily prevented in a large measure by proper methods of handling. While many farmers are getting the most from the manure produced on their farms, yet many could well exemplify the European farmer in this matter, who saves carefully and utilizes every pound of manure available.

The farmer who feeds as much live stock as possible may figure that he is receiving a double remuneration from his crops: First, from the marketing of feeds through live stock; and, second, from the fertilizing substances which are left in the manure. Practically all of the nitrogen, phosphorus, and potash which is in the feeds is recovered in the manure from live stock. All landowners, farmers, and tillers of the soil should always be keenly conscious of this fact, and employ methods of management accordingly.

It is a well-known fact that the animal uses the nitrogen, phosphorus, potassium, and other elements of the feedstuffs to build up the body, carry on the work of the body, and to produce milk, work, wool, etc. At the same time we must remember that all of these processes involve the building up and breaking down of body cells, and the component parts of these broken-down cells are thrown off as waste matter.

In this waste matter we have the same elements as were in the feedstuffs consumed. Except in cases of growing animals, whose bodies are increasing in size, practically the same amount of nitrogen, phosphorus, and potassium are voided in the manure as were contained in the feeds eaten. The exact percentage of these substances voided by live stock varies within wide limits, depending largely upon the age and kind of animal, amount of feed eaten, work which the animal is doing, and various other factors. A young and growing animal retains a large part of these elements in the growing tissues of the body. A dairy cow uses a portion of them in the production of milk. A hard-working horse or a mature fattening animal voids from 90 to 100 per cent of them. It is then evident that a large percentage of the elements of plant food removed on the farm where these crops are fed, ,and that the manurial value of feeds is in direct proportion to their composition.

The following table shows the amount of fertilizing constiuents estimated to be in 1,000 pounds pounds of each of a few common feeds:

The following table shows the amount in pounds of the fertilizing constituents estimated to be in 1,000 pounds of each of a few common feeds:

Feed	Nitrogen	Phosphoric acid	Potash
Corn	16.2	6.9	4.0
Wheat bran (all analyses)	25.6	29.5	16.2
Oats	19.8	8.1	5.6
Cottonseed meal (31.6 per cent protein)	60.2	26.6	18.0
Linseed meal (new process)	59.0	17.7	13.0
Corn stover	9.1	4.0	11.5
Oat straw	5.8	2.1	15.0

Under practical methods of feeding live stock all of the fertilizing sub stances shown in the above table can be returned through manure to th soil. Allowances must be made for small waste in feeding operations, th retention of some nitrogen, phospho rous, and potassium in the animal body, and a reasonable amount of los of these elements from the manure be fore it reaches the fields. With suc losses in view it is safe to say tha when the manure is carefully handle 75 per cent of the phosphorous an potassium and 70, per cent of the n trogen originally present in the feed can be returned to the soil.

From these figures and the abov table we can easily compute the actu value of the manure from a give amount of a feed. We will base ou values upon normal prices of fertili ing materials, as follows:

	Cent
Nitrogen, per pound	
Phosphoric acid, per pound	
Potash, per pound	

The following table shows the a tual value of the fertilizing constit ents returned to the soil in the ma ure from 1 ton each of several typic feeds. The percentages of valuab substances saved and the prices fertilibers as indicated above are us to calculate the values in the table.

Following is the value of manure r turned to soil from one ton of ea feed:

Feed	Nitrogen	Phosphoric acid	Potash	Total
Corn	$4.54	$0.41	$0.30	$5
Wheat bran	7.17	1.77	1.21	10
Oats	5.54	.49	.42	6
Cottonseed meal (31.6 per cent protein)	16.86	1.60	1.35	19
Linseed meal (new process)	16.50	1.26	.97	18
Corn stover	2.55	.24	.86	3
Oat straw	1.62	.13	1.32	3

For example, let us say 1 ton ea of corn, cottonseed meal, and co stover has been fed to fattening stee From the above table we find the val of the manure from these feeds to $28.71. This amount represents a proximately one-half the value of t feeds consumed. No allowance h been made for bedding material, whi has some value as a fertilizer, and not too coarse, improves the physi condition of the soil.

This serves to illustrate the po that the farmer who has the requis number of live stock can use fe stuffs grown upon his farm or pu chased to supply those elements plant food needed by the soil to ma tain its fertility; and by following su a practice consistently he can ov come to a large extent the necess of extensive purchase and applicat of commercial fertilizers.

Let it be understood that the ma urial values indicated in the abo table are within the reach of ev farmer, but not without exercis care in handling the manure produ on his farm.

The liquid portions of the man contain about three-fourths of the trogen and nearly all of the pot voided by the animal. Therefore, is highly important that as much the liquid manure be saved as p sible. This is usually accomplish by using a sufficient amount of bl ding to absorb it, or by allowing it drain into a pit or cistern of some s Spreading manure while fresh is g erally most economical. Where t is impracticable, it should be sto under cover or in a concrete pit, a always kept well packed. "Fire-fa ing" can be prevented by keeping quite moist.

Aside from the fertilizing eleme contained in manure, it has benefi mechanical effects upon practically

SPREAD NOW!

SPECIAL PROPOSITION
10,000 GALLOWAY
NO. 8 SPREADERS

This **extra offer** is made with the idea of getting ten or **more Galloway Spreaders** in every **township** in the next few weeks. One Galloway No. 8 Spreader always sells from one to a dozen more in the same community. That's why I make this **new special offer** to distribute **10000 advertising spreaders quickly**

LOOK! Our new 250 page catalog. Tells you all about the **special patented** features on the famous Galloway Manure Spreader; how to make a spreader pay for itself in six months' time; shows why 3 **exclusive Galloway** patented features make the Galloway Spreader worth $50 more than any other spreader, but cost nothing extra on the Galloway; also shows **full line** of other **Galloway implements** and **merchandise.** S-17

NEW SELLING PLANS

Cash or time—**one year** to pay—**installment plan—note settlement—half cash half note—bank deposit or cash**, at prices so low you cannot afford to do without a manure spreader now. We sell direct at **less** than wholesale from factory to farm at the **actual cost** of material, **actual cost** of labor and only one small profit based on tremendous output.

All Steel Beater and V-Rake

Steel Tongue

LOOK! 3 GREAT INVENTIONS

They make the Galloway Spreader in a class by itself, are:

1. **Invincible Roller Feed** worth $25 on any other spreader. **Exclusive** on the Galloway, but costs you nothing extra. One of the secrets of our light draft.
2. **Patented Automatic Stop, Uniform Clean-Out Push-Board** worth $10 on any spreader. Costs nothing extra on the Galloway.
3. **New Steel Everlasting Beater** with **V-Rake** which gives wide spreading and tears the manure into shreds for uniform available **plant-food.** This exclusive feature alone worth $15. Costs nothing extra on the Galloway.

Many other **special 1916 features:** low down; double chain drive; cut-under front wheels; channel steel frame, trussed like a steel bridge; steel tongue; endless force feed apron; top of box only 42 in. high; front wheels under the box, and other special features **make** it easy for two average horses to handle.

SPREADER PRICES LOWER

Get in on this **special distribution advertising offer** from now until **seeding time.**

At the end of twelve months, if the Galloway spreader has not **paid for itself**, if you have hauled out 100 loads of manure or more, and it has not proven everything I say for it, I agree to **take it back**, pay freight **both ways** and **return your money**, no matter on which plan you buy. Could I make this offer if I was not **sure** of my ground? Every sale backed by a **$25,000 bank bond**—an additional guarantee to you! Galloway spreaders have passed a field test in every state and almost every county.

Ask for this new 250-page book and special proposition today.

Spreaders shipped from Waterloo, Kansas City, Council Bluffs, St. Paul and Chicago.

TOWER'S FISH BRAND

soils. When properly applied, manure improves the physical condition of the soil by increasing its water-holding capacity, aeration, and temperature. While the soluble portion of the manure is at once available for plant use, other plant foods are released as decomposition continues for two or more years. This latter process assists materially in rendering a available for plant use the potash and phosphoric acid which are already present in the soil, but in unavailable forms.

When the farmers of our country thoroughly appreciate the actual amounts of fertilizing constituents which are contained in farm manures, and intelligently care for and utilize the manure produced on their farms, they can save millions of dollars in fertilizer purchases; and the necessity of depending upon the purchase of these fertilizers, followed by the occurrences of crises in the fertilizer situation such as now exists in some sections, will be largely decreased.—Weekly News Letter, Dept. Agriculture.

SPRAYING APPLE TREES PAID WELL

By cooperating with twenty-five orchardists the Missouri College of Agriculture was able to spray each orchard four times a year at a cost of $22.26 per acre. The fruit on the unsprayed trees sold for $18.05 per acre as compared with $187.19 or more than ten times as much after spraying. This makes the average net profit of $136.78 which repays the outlay for spraying and five times as much more in addition. Few farm investments will pay as good returns as this and those who have orchards of any size will be interested in learning the methods which the college advises as a result of its years of experience and experiment.

FIRST SPRAYING.—Just after the first clusters of leaves have opened in spring, but before the blossoms themselves have unfolded, use either Bordeaux mixture (3 pounds copper sulphate, 3 pounds lime, 50 gallons water) or commercial lime sulphur, (1⅓ gallons to 48½ gallons of water.) This controls the apple scab disease, which causes most of the specked and knotty apples found in many orchards.

SECOND SPRAYING.—Immediately after the majority of the blossoms have fallen use 1½ gallons of commercial lime-sulphur in 48⅓ gallons of water. Before filling the barrel with water, add 2 pounds of arsenate of lead paste to poison the insects. Stir the paste thoroly in a bucket of water before pouring into the sprayer, as otherwise it will sink to the bottom of the barrel in a lump. Prevent apple scab and the two worst insects of the apple—codling moth and curculio.

THIRD SPRAYING. — Three weeks after the blossoms fall, use either Bordeaux mixture or lime-sulphur as directed under first application. Also add 2 pounds of arsenate of lead paste. (For the purpose of poisoning the curculio and codling moth insects and preventing apple scab, apple blotch, black rot, and other diseases.)

Under usual conditions, in the latitude of northern Missouri, three sprayings are sufficient. In that of southern Missouri where there is danger of bitter rot two or three additional sprayings will be necessary. The fourth should be given six weeks after the blossoms fall using Bordeaux mixture 4-4-50 or 5-5-50, and if there are signs of a late brood of codling moth add 2 pounds of arsenate of lead. Other sprayings may be given at intervals of two weeks, using only Bordeaux mixture at the rate of 5-5-50. Lime sulphur is not reliable for preventing bitter rot.

SPRAYING OUTFITS. — A barrel sprayer will spray about ten acres of orchard and costs, complete, from $12 to $33. A bucket sprayer costs $3.50 to $8. The small hand compressed air and knapsack outfits are used for spraying potatoes, nusery trees, berries and vineyards. They cost from $5 to $15. All sprayers should have brass working parts which are not injured by Bordeaux mixture.

J. C. Whitten, Missouri Experiment Station.

FERTILIZERS FOR CORN

Increasing interest is being manifested in Missouri and adjacent states in the use of fertilizers for corn. Many of the inquiries received ask for the best methods of applying the fertilizer as well as the best fertilizers to apply.

If properly used, commercial fertilizers are helpful, particularly on certain soils, but it is usually better to keep the soil in good condition by the proper use of barnyard manure, crop rotation, clover, cowpeas and similar crops which build up the soil.

By tests made on the outlying experiment fields in various parts of the state, Missouri Agricultural Experiment Station has found that on the usual medium-to-low-fertility upland soils the highest net return per dollar invested in fertilizers is secured by applying from 75 to 90 pounds per acre of a fertilizer containing about 2 or 3 per cent nitrogen, 8 or 10 per cent available phosphoric acid and from 2 to 5 percent of potash. The same amount of steamed bone meal also gives good results. These recommendations consider only the effect on the corn crop, but leave out of consideration any part of the fertilizer which may remain to benefit later crops.

On very thin lands from 200 to 250 pounds per acre of the same fertilizer should be used. When larger amounts of fertilizer are applied following crops will be benefitted much more, and special care should be taken to apply with a fertilizer grain drill instead of by means of a fertilizer attachment in the hill or drill at the time of planting. The application of from 75 to 90 pounds will usually give the best results if applied in the hill or drill. The application of too much fertilizer in the hill or drill at time of planting is dangerous on a dry season, when it is likely to cause the corn to fire, but in seasons of abundant rainfall as much as 150 pounds may be applied in the hill or drill without danger.

While fertilizers properly used are very valuable on some soils, the good corn grower will not depend upon them to maintain or keep up soil fertility. They are temporary helps in securing or increasing a crop and should always be used with the best rotations for the locality. If fertilizers alone are used year after year the effect on the soil will be very much the same as tho corn had been grown without fertilizers, altho the crops may be larger so long as the fertilizer applications are continued.

M. F. Miller,
Missouri Experiment Station.

Make Your Hens Lay

One of the finest tonics on the market to make your hens lay lots of eggs and eggs that will produce vigorous chicks is "Poultry Panacea," put up by Dr. Hess & Clark, at Ashland, Ohio. Drop them a card for full information and mention The Missouri Farmer.

P&O

Wiggletail Disc Cultivator

Pivot tongue type. Wiggletail feature makes it eay to operate. Shovel gangs can be furnished, making it doubly popular with farmers who use Disc Cultivators.

It's the Way We Build Them

Tongue pivoted in socket at front end of frame, and also pivoted on arch. When rear end of tongue is moved sidewise by the shifting of the seat, frame is carried in opposite direction, and with it the arch and gangs. This constitutes the "Wiggletail" feature, and makes this one of the easiest cultivators to ride and operate ever built. An ideal cultivator for use in crooked rows or on hillsides.

Only one lever to operate at ends of the row. It raises both the gangs and maintains balance. Discs can be reversed without using a wrench or removing bolts. Discs easily tilted and angled, as levers are within easy reach. The disc bearings have oil-soaked hard maple bushings. Gangs angled from the seat; each gang is operated by its own lever. High steel wheels; removable dust-proof boxes, sand bands and screw caps for using hard oil.

The operator is always in a good position to see his work, with a clear view ahead. The operator's weight glides on rollers when swinging seat bars in dodging. Telescope axle provides neat and easy means of setting wheels for wide or narrow track.

Knife Leveler, Harrow, Four and Six Shovel, Front Arm and Spring Tooth Attachments can be furnished.

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

SOME THINGS WORTH WHILE

Along about the end of each year it is a good idea for all of us, farmers or merchants, to make a summing up of what we have done and see where we stand so far as profits are concerned. Then at the beginning of the crop growing season it is important that we take a future survey of probabilities, possible prices and profits, for without profits the farmer cannot get himself and family those things which are really "worth while." The farmer does not need any prodding up about industry for the very nature of his business has through a long line of heredity trained him in industry as few others have ever been trained. In fact the farmer has generally been so busy making a living that he has not taken the time he ought to have taken in order that he might reap his fair reward for his labor.

Before the farmers can enjoy many of the comforts and conveniences of life which are now absent from so many farm homes they must through better business methods find a way to save waste and to change the present system of marketing their products as well as of buying many of the things which are used on the farm. In our last issue we reported the good work done by the club at Carl Junction in Southwest Missouri (by typographical error Carl Junction was located in Northwest Missouri. The location is in Jasper County) and on pages 12 and 13 in this issue the reader will find an excellent report of what the Farmers' Union of Pike County is doing at Bowling Green.

We are very naturally gratified at the showing made by both these clubs because they are along the exact lines The Missouri Farmer has been for six years urging the readers of the paper to take hold and protect themselves. Our readers will notice that neither of these clubs attempted to enter the field of the retail merchant. There are obvious reasons why a farmers' cooperative society should not go into the various retail lines of dry goods, clothing, shoes, drugs, groceries, hardware, etc. In the first place there are already too many of these retail merchants in most towns, and competition is close enough to give in most things reasonable prices. And then experience in the past has shown that when farmers enter this field of retail merchandising most of them fail because they lack both capital and the right kind of training. When farmers believe they are not getting fair prices if they are organized, they can usually make contracts with the best merchants for lower prices by clubbing their purchases. There is no need of any bad feeling between the people of the country and those of the town when both understand each other. Mr. Ingwersen says that the success of the Pike County Club has brought success to the merchants of Bowling Green and why should it be otherwise? There are very few towns in Missouri but what get by far the greater part of their support from the farmers and as a matter of course the town's prosperity is measured by the thrift of the country.

Leading up to the thought we had in mind when we started to write this article the first thing "worth while" for farmers to give serious thought about is to stand together in organization so as to save money in buying and to compel better prices in selling and to cut out all the waste possible in handling. This is the first thing worth while in most farm homes because it takes money and a lot of it to get better roads, better schools, wind mills, running water in the house and barn, gasoline power to save hand power, the automobile for pleasure and recreation, a modern heating plant to take the place of the dust making stove, pictures on the wall and books and magazines on the table and a score of other things any farmer or farmer's wife will vote is "worth while" toward making life in the country what it ought to be and what God has made possible it should be.

THE COST OF BAD ROADS

The last six or eight weeks ought to bring pretty forcibly to the mind of every man living on a poorly kept road something of the cost of bad roads. If the cost of bad roads could be measured in dollars we think much of the trouble would soon be remedied but the greater loss being in the social life of the country men go right along enduring intolerable conditions without doing anything to make them better. Ask the country teacher what is the greatest obstacle in the way of better rural schools and the answer, nine times out of ten, will be bad roads. The country preacher will tell you the greatest thing in the way of prosperous country churches is bad roads. The literary clubs for young people, the social clubs for the women and even the business clubs for the men are all hampered in their full development by the one, always present impediment—bad roads.

The only road dependable 365 days in the year is the well made hard surface road but they cost a lot of money —anywhere from $3,000 to $6,000 a mile and sometimes even more than that but if we would go at road building in a business like way any good agricultural community could have good hard roads without feeling the weight of the extra cost. In the first place we could engage in more profitable lines of farming if we had good roads the year round. Take a community say ten miles square with the railroad station as the center. With a road on every section line there would be 200 miles of road in the district. If the farms were of average Missouri size there would be 500 farms in this district. If one-half this number of farmers would take up dairying and establish a cooperative butter making plant four-fifths the increased profits above what the average farmer now receives for his butter fat would pay the interest on the cost of the 200 miles of good hard roads at $4,000 a mile. You say that is impossible? Well figure it out and see. Reliable reports show that a successfully constructed cooperative butter plant can pay the farmers around 5 cents a pound more for their butter than they get under the old system. This can be done because of the better quality of butter made and the consequent higher price it will bring together with some other savings.

Here are the possibilities. If one-half the 500 farmers took up dairying and averaged 20 cows to the farm we would have 5000 cows furnishing cream for the plant. No good dairyman will keep a cow that will produce less than 200 pounds of butter yearly. This minimum would give a total product of 1,000,000 pounds and the extra profit of 5 cents would give us $50,000 or enough to pay the interest on the cost of the roads and $10,000 besides. Then if we count on the other half of the farmers paying their share of the cost we could build these roads pay for them in 10 or 15 years and not really be out one cent. Is not this "worth while?"

If we want real good roads, business roads, we must try to adopt some sort of farming or any way such business methods in whatever kind of farming we do that will give us the money to pay for them.

The above ideal is not too high for any real first class farm community but if your district is not ready for such an up-to-date program then let us suggest that you fall back on the old reliable King split log drag. Perhaps you can't have a first class road every day in the year but with the constant use of the drag you can have a first class road part of the time and a passable road most of the time and certainly this is a thing "worth while."

LET THE GOOD WORK GO ON

Not since the days of the ascendency of the Grange and Alliance have the farmers shown so much interest in organization as they are showing now and well they may. This interest is wide spread in Missouri and it extends through many states, some of them already much farther along in organization work than we are. No doubt the packers have already seen the handwriting on the wall and have taken their heavy hand off the price of hogs. What other intelligent reason can be given for a fifty per cent advance in the price of hogs in so short a time? Surely demand and supply have not changed so much as that. But anyway let us urge farmers not to let their little school house clubs go down, now, that spring work is on. These clubs should be kept alive and when there is no business matters before the club then the time can be spent in discussing better farming, better roads, better schools, water systems for the house and barn and a hundred other things "worth while" to every wide awake farmer in the state.

After the home club is working well it will be a good idea to get over into adjoining districts and tell the farmers over there what you are doing and what they can do. Remember that while one club acting alone can do things "worth wile" and of great value to its members, there are greater things such as whipping the packers and other combinations that will require the united force of thousands of clubs to win. Let us not rest until every school district in the state is organized and working to do its part.

THE HOG MARKET

Now, after the bulk of the farmers' hogs are in the Packers' hands, hogs have suddenly taken a "flyer," and it is pretty certain that stiff prices will be maintained for some time to come. Has there been any change in the domestic or foreign markets to justify this sudden rise in price? Not at all. The foreign demand was powerful in November, December and January when the Packers were buying hogs at their own price and compelling the farmers of the Corn Belt to sacrifice untold millions of dollars. The same general facts apply to cattle. What does it all mean? First, that with the lion's share of the farmers' hogs in their possession, the Packers know it is safe to be generous for a little while. Secondly, the El Paso convention convinced them that the "woods are afire," and for once in their lives the Packers are really frightened. They are wondering whether, after all, they haven't "overplayed their hand"—and hence they are throwing out a little "sop" to quiet the rumbling of the distant thunder. Will farmers "fall" for it? Time alone will tell. But we don't think so. In the language of McBeth, we believe that from this time on it will be a case of "Lay on McDuff and d—— be he who first cries hold, enough!"

DANGER AHEAD

One would think that after so much had been said about the poor vitality of seed corn of last year's crop there would hardly be a corn grower in the country who would fail to test the seed before planting, but we know of at least a few farmers who have not yet done so. On being asked about the quality of seed corn the other day, a Boone county farmer said, "Well, I guess my seed will grow. I got it shucked out a while before Christmas and I think it has had time to dry out and I am going to risk it." Good luck may favor this man, but why trust to luck when there are ways to find out for sure. The fact is, last year was not favorable for early maturing of the corn and the early freezing injured the vitality of a lot of corn that is now in apparently good condition. Corn, when thoroughly dry, will stand a hard freeze without injury, but corn that is not dry is easily injured by even a moderate freeze.

There are so many disadvantages in a poor stand of corn that it pays to be certain about the quality of the seed planted. With a half stand or better a farmer will usually replant, but the later planting is all the season in the way of the right kind of cultivation and when maturing is injured by the earlier corn. If the field is planted over entirely the weeds will get a start of the corn and will make cultivation difficult. The cost of replanting and the extra seed make the cost of poor seed corn more than it would take to buy first class, guaranteed seed from some reliable grower. Most every farmer is familiar with the different methods of testing which have so often been explained in The Missouri Farmer and other papers and the satisfaction of knowing the seed is good will pay, while the discovery that the seed is bad will pay big. Let us repeat that from reliable sources we have good evidence that a lot of last year's corn crop is very poor in vitality and will not do to plant with safety.

DID YOU SEND A DOLLAR BILL?

Did you send us a dollar bill on subscription between the dates of Feb. 10th and Feb. 18th? We are anxious to trace the number of dollar bills sent us during this period and if any of our subscribers remitted during the above time we will thank them to advise us.

The Missouri Farmer.

BARNYARD GOSSIP

One day last summer I drove by a farm just after the owner had driven into the wheat field to harvest a splendid crop of wheat. The farmer had gone but a round or two and to my surprise when I came within hearing distance the air was blue with profanity and when I got closer I saw the man had stopped because the knotter on the binder was not working, the elevators had been chocking up and in fact pretty near every thing about the machine was giving trouble. Being acquainted with the farmer I accosted him with "What is the matter so early in the day?" You ought to have heard what he had to say about that old reaper. Said it had "only been used two years, had cut only about 160 acres of wheat and oats and now it was played out, absolutely worthless." "Men who make and sell a machine like that ought to be landed in the penitentiary" he said while wiping the prespiration off his face with the greasy end of his shirt slee "If I can get the rust worn off that old machine" he went on to say "maybe I can finish this harvest with it and then I will dump it into a ditch somewhere and that is the last machine of that make any man will ever sell me. I want a binder that will last longer than three years without giving all sorts of trouble and costing enough for repairs to buy a new plow." I saw my friend was in no humor for entertaining visitors so I drove on and when I passed the barn lot I estimated he had about $800 worth of machinery and all standing out in the weather, and had been all the year.

Driving on about a mile I came up beside another wheat field, but what a difference! Several acres were in the shock and the binder, driven by an 18-year-old boy was playing about as sweet music as a harvester ever heard. The boy seemed to have nothing to do save to touch up one of the old mules occasionally, and I suppose every hour he oiled the bearings and tightened up the nuts while the mules "took a little wind." The old farmer just seemed to be taking things "easy like," helping with the shocking, keeping up the corners and looking out that every thing kept moving. When I drove up he seemed in such a good humor, I accepted his invitation to get over the fence and examine his wheat and make a guess on what it might yield, which I concluded was about 27 bushels of 60-pound wheat per acre. Didn't hear any profanity there either, wasn't any need for it, because everbody was in a good humor any every thing working like clock work.

"That old machine" said farmer No. 2 has harvested ten crops for us and I think it is good for two or three more with a little repair. It has paid for itself two or three times, but then you know we never leave it out after a crop is harvested, but it goes right into the shed."

This man had the same size farm as the first man and about the same amount of machinery to run it. As I drove away I figured up about this way: Farmer No. 1 spent $800 for machinery which lasted only about four years, and much time was lost and money spent for repairs, and a heap of worry had to be endured because the machinery was never in good repair. Farmer No. 2 had no worry, spent little for repairs and the machinery gave good service about ten or twelve years. One spent $800 for machinery in 12 years the other three times as much and did not then get as good service.

Something is "out of joint" with farmer No. 1 to the amount of $1600 and the reckless use and failure to house valuable farm machinery is losing the farmers of this country millions of dollars annually that ought to be saved to swell the farmers' bank account. In 1910 when the U. S. census was taken there was more than $50,440,000 invested in farm implements and machinery just for the State of Missouri. The annual interest charge on that amount is $3,000,000 at 6 per cent and the annual depreciation including repairs is probably not far from 20 per cent making the yearly cost of this one item of farm expense about $13,000,000.

Where are your machines brother? Are they in the shed or on the sunny side of a barb-wire fence?

This is the kind of a road that lost a Kansas farmer $1,800 by cutting him off from his market.

The Concrete Road enables the farmer to reach his market in any kind of weather.

A Soft Road Cost Peter Coughlin, of Concordia, Kas., $1,800 in One Week

THE *Kansas Farmer* says: "John W. McCoy, Vice-President of William Volker Co., of Kansas City, recently made a speech in his old home town, Concordia, Kansas, in which he recounted the experience of Peter Coughlin, whose place was about three miles east of town. He said:

'As an excuse for talking good roads I remember an actual case. While employed at the B. & M. depot, the general live-stock agent at the request of a Chicago Commission Company, wired our office to have a feeder ship his cattle on a certain date. Under normal conditions, Mr. Ralston would have driven out and advised this man, *but the roads were impassable for vehicles,* and the message was taken on horseback. This feeder said it would be *impossible to get the cattle to the station,* as he had that morning been to town and knew the condition of the roads. *When they could be traveled, the market had declined $2.50 per 100.* On this lot the farmer suffered a loss on the two cars of nearly $1,800. No doubt a similar loss, or road tax, if you please, has been collected many times during the past 20 years and will be again frequently in the next 20.'"

Conditions not half as bad as this on *your* roads may be costing you hundreds of dollars this year in lost market opportunities, in high haulage costs paid in worn-out horses, harness and wagons, and heavy tax for maintenance of impermanent roads.

A concrete road is permanent, and it is open the year round in every kind of weather. Its first cost is low, approximately $15,000 per mile for a 16-ft. road, and its annual maintenance averages but $30.00 a mile for complete upkeep and repairs. In the end, the concrete road is the cheapest permanent road you can build. It will save you money in haulage and road taxes, and will increase the value of your property.

CONCRETE FOR PERMANENCE

A LOYAL READER

The Missouri Farmer:

I have been reading The Missouri Farmer for the last two years and have been much interested in the different subjects discussed from time to time and very much interested in your earnest appeal to the farmers of Missouri for their encouragement and support. I enclose my dollar as per your proposition No. 1 which will tell you better than any words I could write that I am with you.

I want to say for the benefit of any one who is not yet awake that The Missouri Farmer is considered a permanent fixture in our home. The "After Thoughts" articles are alone worth more than what the paper costs.

I am now taking eight different farm journals and two poultry journals and I consider The Missouri Farmer the best one of all — the cream of the bunch. Why? Because it is for Missouri farmers first, last and all the time; because its principles are sound; because it is not afraid to speak out; because it wears a plain business suit, deals with plain facts and is high class in its moral teaching; because it is abreast of the times in its editorial matter; and last, because, it is published in our own state and lives up to its motto: "For better farming, better farm homes, better citizenship." I stand with you always for a greater and better Missouri.

W. H. Stotts, Gibbs, Mo.

THINGS OF PERTINENT INTEREST

Every reader of The Missouri Farmer should drop a line to the International Harvester Co., Chicago, and ask for a copy of the "Almanac"—a book containing a vast fund of invaluable information for the farmer. It has everything about weights, measurements, plans for farm buildings and a hundred other things. It is free for the asking. Please mention this paper.

If you are interested in farm tractors, drop a card to the Avery Co., at Peoria, Ill., or the Emerson-Brantingham Co., at Rockford, Ill., and ask them to send you their big catalogues telling all about these great new labor saving machines. The time isn't far off when tractors will be as plentiful as automobiles.

The William Galloway Co., of Waterloo, Iowa, is making a special price on manure spreaders—and every farmer ought to have one and get the full value of his manure.

If you want to make your hens lay to capacity, try some "Poultry Panacea," put up by Dr. Hess & Clark, of Ashland, Ohio. Ask them for their "Stock Tonic" literature also. It's free.

The Janesville Barb Wire Co., of Janesville, Wis., is putting out a steel fence post whcih is attracting a great deal of attention among farmers. It will last a lifetime.

Spare All Corn Roots

"These Corn Roots Five Inches of Surface."

FARMER Be Not DECEIVED

The Tower System is Proved

by practical experience adapted to wet seasons as well as dry. Scores of the most expert seed growers and many thousand farmers testify that it is adapted to both wet and dry weather. We furnish our inquirers with unquestioned testimonies of these facts. The Tower System enlarges the crop yield because it spares all the corn roots. It pays for itself in one season. Avoid imitations; see that your cultivator has the name "TOWER" on the tongue. Write a postal for our free booklet on "Corn Culture."

By ROY NORTON

Author of "The Garden of Fate"

(Concluded from last issue.)

THE QUEST SUPREME

It was twilight again, and such a twilight as only the Blue Mountains of that far divide may know. It barred the west with golden bands, painted lavish purples and mauves in the hollows, and reddened the everlasting snows on the summits. It deepend the greens of the tamaracks, and made iridescent the foams of the streams tearing downward joyously to the wide rivers below. It painted the reddish-yellow bars of the cross on the peak above the Croix d'Or, and rendered its outlines a glorified symbol. It lent stateliness to the finger of granite beneath the base that told those who paused that beneath the shaft rested one who had a loyal heart. It swooped down and lingered caressingly on the strong, tender face of the girl who sat on the wall surrounding the graves of Bells Park and "the best woman that ever lived."

"For some reason," Joar said, speaking to the two men beside her, "the ugliness of some of it has gone. There is nothing left but the good and the beautiful. Ah, how I love it—all! All!"

Dick's arm slipped round her, and drew her close, and unresisting, to his side.

"And but for you and Bill," he said softly, "it might never have ended this way."

"Humph!" drawled the deep voice of the grizzled old miner. "Things is just the way they have to be. Nobody can change 'em. The Lord Almighty fixes 'em, and I expect they have to work out about as He wants 'em to. Somehow, up here in the tops of the hills, where it's close to the sky, He seems a heap friendlier and nearer than He does down on the plains. 'Most always I feel sorry for them poor fellers that live down there. They seem like such lonesome, forgotten cusses."

The youthful couple by him did not answer. Their happiness was too new, too sacred, to admit of speech.

"Now," Bill went on argumentatively, "me and Bully Presby are friends. He likes me for standin' up for my own, and told me so to-day. He ain't got over that feller Wolff yet. Says he could have killed him when he found out Wolff had poisoned the water and rolled the bowlder into the shaft to pen us in. I reckon Wolff tried to blackmail him about what he knew, but the Bully didn't approve none of the other things. That ain't his way of fightin'. You can bet on that! He drifted over and got the green lead in the Cross, when others had given it up and squandered money. That shows he was a real miner. We come along, and—well—all he's done is just to help us find it, and then hand over the proceeds, all in the family, as I take it. Nobody's loser. The families gets tangled up, and instead of there bein' two there's just one. The Rattler and the Croix d'Or threatens to be made into one mine, and the two plants consolidated to make it more economical. The green lead's the best ledge in the Blue's, and 'most everybody seems to be gettin' along pretty well. That ain't luck. It's God Almighty arrangin' things for the best."

He sat for a moment, and gave a long sigh, as if there were something else in his mind that had not been uttered. Dick lifted his eyes, and looked at him affectionately, and then whispered into the ear close by his shoulder: "Shall I tell him now?"

"Do!" Joan said, drawing away from him, and looking expectantly at the giant.

Dick fumbled in his pocket with a look of sober enjoyment.

"Oh, by the way, Bill," he said, "I got a letter from Sloan a few days ago. Here it is. Read it."

The latter took it, and frowning as he opened it, held it up to catch the light.

"Great Scott!" he exclaimed. "Gives the Croix d'Or to you. Says he wants you to have it, because the one that made good on it, and he don't need the money! That the deeds are on the way by registered mail, and all he asks is a small bar from the first clean-up!"

He folded the letter, and held it in his hands, looking thoughtfully off into the distance for a time while he absorbed the news.

"Why, Dick," he said, "you're a rich man! Richer'n I ever expected you'd be; but I'm a selfish old feller, after all! It seems to me as if we ain't never goin' to be the same again, as we uster be when all we had was a sack of flour and a side of bacon, and the whole North-west to prospect. It seems as if somethin' mighty dear has gone."

Dick got up and stood before him, with his hands in his pockets, and smiling downward into his eyes.

"I've thought of that, too, Bill," he said, "and I can't afford to lose you. I'd rather lose the Cross. So I'll tell you something that I told Joan, long ago—that if ever the mine made good, and I could give you something beside a debt, you were to have half of what I made. A few days ago it would have been a quarter interest you owned. Now it is a half. We're partners still, Bill, just as we were when there was nothing but a sack of flour and a side of bacon to divide."

They looked at him, expecting him to show some sign of excitement, but he did not. Instead, he reached over, and painstakingly pulled a weed from the foot of the wall, and threw it away. He cleared his throat once or twice, but did not look at them, and then got to his feet and started as if to go down to the camp. Then, as if his feelings were under control again, came back, and took one of Joan's and one of Dick's hands into his toil-worn palms, and said:

"Thanks, Dick! It's more'n I deserve, this knowin' both of you, and havin' you give me a share in the Cross! And I accept it; but conditionally."

He dropped their hands, and turned to look around, as if seeing a very broad world.

"What is the condition?" Joan asked, laying her hand on his arm, and looking up at him. "Can we change it?"

"No," he said; "you can't. I've had a hard hit of my own for a long time now. I'm a-goin' to try to heal it. I'm goin' away on what may be a short, or a long, long trail." His voice dropped until it was scarcely audible. "I'm goin' away to keep goin' till I find The Lily. And when I find her, I'll come back, and bring her with me, if she'll come."

He turned his back toward them, unbuttoned the flap of his flannel shirt, and reached inside. He drew out a sheet of paper wrapped in an old silk handkerchief, as if it were a priceless possession to be carefully preserved, and held it toward them. He did not look at either of them as he spoke.

"I got that a long time ago," he said; "but somehow I could never say anything about it to any one. And I reckon you're the only two in the world that'll ever see it. Read it and give it back to me when—when you come down the mountain."

He turned and stalked away over the trail, his feet planting themselves firmly, as he had walked through life with firmness.

They watched him go, and opened the letter, and read, in a high, strong handwriting:

Dear Mr. Mathews: I am writing you of business, for one thing, and because I feel that I must, for another. I have paid for a tombstone suitable for Bells Park, whom I esteemed more than I have most men. And I have paid for its delivery to you, knowing that you will have it mounted in place. So you must pay nothing for it in any form, as I wish to stand all the expense in memory of an old and tried friend. I have left Goldpan for good and all, and all those old associations of my life. I am starting over again, to make a good and clean fight, in clean surroundings. I am sick to

death of all that has made up my life. I am bitter, knowing that I was handicapped from the start. My father educated me because it was easier to have me in a boarding school in all my girlhood than to have me with him. I never knew my mother. I had no love bestowed upon me in my girlhood. When I came of age my father, who was an adventurer of the discredited gentleman type, gave me to a friend of his. I learned a year after I had been married that I had been sold to my husband—God save the mark! I tried to be patient when he dragged me from camp to camp, and I want to say that whatever else I have been, I have been good. You understand me, I hope, because I am defending myself to you, the only living being for whose esteem I care. I have had two happy moments in my life—one when the news was brought me that my husband had shot himself across a gambling table, and the second when you faced me that night after Bells Park was killed, alone there in the street after your partner had gone on, and said: "Lily, it hurts you as it does me. You're on the level, little pal. I want to stop long enough to tell you I believe in you." Then you went on, and I shall not see you again.

I am writing this from a place I shall leave before it starts to you. You could not find me if you had the desire, and so I say to you that which perhaps I never should have said, if we had remained in sight of each other in the Blue Mountains. You are the only man I have ever met who made me heartsick because I was not worthy of him, and could not aspire to his level. You are the only man I have ever loved so much that it was an ache. You are the only man who told me by the look in his eyes, that he thought my life unworthy, and accused me without words every time we met. I am through with it, and if it will do you any good to know that your reproaches have done more than anything else to cause me to begin all over again, and live a different life, I want you to have that satisfaction. And this shall be my only good-by.

Lily Meredith.

For a long time Joan stood holding the letter in her hands, and then, as if fathoming its cry of loneliness, clutched it tightly to her breast.

"He will find her!" she said. "I know it! He must! It wouldn't be kind of heaven to keep her from him. And he loved her all the time!"

Far across the peaks of the Blue Mountains the last rays of the sunset went out, as an extinguished torch. A bird near by cheeped sleepily, and the new night was coming to its own. Throbbing, rumbling, and grinding in a melody softened by distance, the roar of the Rattler's mills became audible, as it brought the yellow gold, glistening and beautiful, from its sorbid setting of earth. In the camp of the Croix d'Or a chorus was wafted faintly up as men sitting in the dusk sang: "Hearts that are brave and true, my lads, hearts that are brave and true!"

Silently, arm in arm, they gave a last lingering look at the shaft, the peak above, and turned down the trail to the camp which seemed all aglow with rosy light.

(The End.)

CARE OF BIRDS IN BREEDING PEN

During the breeding season it is advisable to pen the best birds in order to hatch from them that the flock may be improved.

It is too often the case that hens are taken from the range and placed in a close pen without proper conditions to make and keep them healthy, happy and profitable.

There is no question but that the hen which has free range where she can select her own food as well as get proper exercise will do better work producing eggs and that the eggs are more fertile and the chicks hatched are stronger than the hen which is penned without proper conditions.

In order to supply the proper conditions for the hens, we should study their natural habits. We know the hens are fond of earth worms and there are many morsels of food selected from fresh earth by the hens; therefore, it is a good plan to turn some earth over in the pen each day with a spade. This should be done each morning as the earth worms come to the surface each night, then go back into the earth when the sun comes up. Therefore, the work should be done between daylight and sunup. If it cannot be done at this time, some boards or an old door should be laid on the ground where the digging is to be done. This protects the worms so they remain near the surface. A space of soil three feet sqare turned over each morning will furnish twenty hens with fresh earth to work in during the day and by moving systematically about the yard it will prevent the soil from becoming contaminated with disease.

Sunshine is one of nature's greatest gifts but "the same sun which melts wax will harden clay." Although sunshine is of great value for it stimulates the birds to greater activity and is Nature's disease destroyer, yet if it is used to excess, it may do great injury. Aside from a sun bath, it seems to be the fowl's inclination to stay in the shade during hot, sunshiny days, and wander into the open only during cloudy days and early and late in the day. If the birds are penned, they should be furnished plenty of shade. If natural shade is not at hand, artificial shade should be furnished. A good plan is to build a platform 18 inches or two feet from the ground, and if it is so it can be removed, the earth can be dug up underneath, making a splendid place for the hens to spend the hot part of the day.

During wet, rainy weather, the hens have an inclination or desire to get up onto something out of the mud. They will get on the woodpile, the fence, a wagon, or in fact anything to be up off the ground. The platform just mentioned makes a splendid rest for them. During hot, dry weather, the hens get under the platform for shade, and during the wet weather, they get on toop of it out of the mud.

The hens appreciate all these little things and show their appreciation by the quantity and quality of eggs produced.

The hens in the Missouri National Egg Laying Contest made good records during February. There were 7462 eggs laid during the month, or an average of 14 eggs per hen. The averages for five years here in the contests have been as follows, fractions omitted:

1912, 10 eggs each; 1913, 12 eggs each; 1914, 13 eggs each; 1915, 14 eggs each; 1916, 14 eggs each.

The ten highest pens to date are as follows:

R. C. Reds, Missouri	399 eggs
White Rocks, Washington	387 eggs
Barred Rocks, Missouri	346 eggs
Black Orpingtons, Indiana	345 eggs
Oregons, Oregon	342 eggs
White Wyandottes, Missouri	338 eggs
White Wyandottes, Michigan	330 eggs
S. C. White Leghorns, Washington	327 eggs
S. C. White Leghorns, Texas	314 eggs
S. C. Reds, Iowa	310 eggs

The five highest pens for February are as follows:

White Rocks, Washington	114 eggs
S. C. White Leghorns, Washington	107 eggs
Barred Rocks, Missouri	105 eggs
White Wyandottes, Missouri	104 eggs
S. C. Reds, Iowa	103 eggs

C. T. Patterson, Missouri Poultry Experiment Station, Mountain Grove.

LYON'S PRACTICAL FARM PAPERS

I sold my 4000 pound tobacco crop to a local dealer at 12 cents per pound, and he sold it over the loose leaf market, in which he is a large stock holder. He told me that his net profit was $6.85, but I have since been told that it was $60. This man I have known all my life, and if I was to go to him today, asking a favor, even to asking him to endorse my note for $1,000 or $2,000 he would do it without a word. If I had his word or opinion on any matter, aside from the purchase of a tobacco crop, I would consider it as correct and final, but I could not believe his oath regarding a tobacco deal

It is just the same here, and elsewhere, with speculators, as another incident will show. A man bought a cheap horse of a cousin by marriage, a horse dealer, and one who had been the recipient of many a favor from the man he sold to. This is what the dealer told the buyer. "I don't know anything about him, except that Bill White says he bred him and he is twelve years old. I know he is a good worker and a good driver, and think that he came from twenty miles north." Ten days later a man from six miles east came along, and said, "Why you bought Prince of Jim. He is an awful good horse, but is subject to colic spells, which I told Jim when I traded him to him for this gray mare I am riding." Now Jim had simply lied to as good a friend as he ever had.

We are told that wagons are $10 higher, walking plows $1 higher, riding plows $3 higher, binders $5 higher, and the other day I paid 25 cents more for an ax, and 25 cents more for a mattock, than the same tools cost a year ago.

It is said that these advances in price are due to the riot among the half civilized people in Europe, but I don't think so. I think that they are due to the fact, that this riot has cut off foreign demand, and that as manufacturers must have just so much profit, they have advanced prices so as to cover the loss from lack of export demand and so if the loss of export trade permits the sale of 5 per cent, or ten per cent less goods, that 5 or 10 per cent must be added to the price of goods sold at home.

Now get at the other side, the price of farm produce. The 1915 tobacco crop is practically all sold; perhaps 95 per cent of it. It has been weighed and found to be a little more than 60 per cent of an average crop, and instead of selling at 40 per cent advance over 1914, the advance was 11 per cent. Now that leaf tobacco is all out of the farmers hands, and a great part of it in the speculators warehouses, prices will soar, but if farmers had held on to even 20 per cent of the crop, prices would not have advanced 10 cents per cwt.

It is known that the 1915 corn crop in five or six great surplus states is a very poor one, both in yield and in grade, millions of bushels of shelled corn in Nebraska and Iowa testing not

BARGAINS IN BUGGIES AND ENGINES

over 48 pounds per bushel but there is no great advance in prices, nor will there be until speculators get all the corn in their possession. It is easy to trace the operations of all kinds of speculators and traders, through the rise and fall of markets. No one ever saw wheat sell high in July, August, or corn sell at its worth in October, November.

It has been figured out to within a few days, if when heavy supplies of hogs and cattle will be in market, and their prices go down low enough to suit packers.

Only through organization can farmers ever hope to get the true value of what they sell. I note one thing which pleases me. At a recent meeting of the Nebraska Farmers Union,, 1,000 members of the Society of Equity went into the Union. What we need is, a merger of Grange, Farmers Union and the three divisions of the Equity Society. Such a merger would triple the power of farm organization work, but will the leaders of the various societies stand for it? If not, it can be truthfully said, they do not stand for the welfare of the people.

An eminent agricultural teacher is credited with having made the statement, in a lecture at one of the meetings, that "farm made manures have no value aside from their fertility value."

I did not hear the address, but had it from several men who did hear it, and few of them seemed to agree with the conclusions of the man who made it. For forty years as a writer for the farm press and for thirty years a speaker at farmers' institutes, a user of farm made manures all my life and a user of chemical manures since 1877, I have always believed, and have taught that farm made manures were superior to chemical manures, in that they add humus to the soil and improve its mechanical condition, but here comes a teacher who says I am wrong.

When Sam Jordan spent three days with me last August, and I told him that much of our land had been under cultivation for 120 years, he said "tell me how you have managed to keep up the fertility, and prevent washing on this rolling and hilly land." I told him that we followed a rotation of one year in plow crops, corn and tobacco, one year in small grain, and two years in clover and timothy. Our manure is nearly all used on plow crops, we never trim off weeds or grass, and we use chemical manure on corn, tobacco and small grains.

He then said, "Well C. D., when I consider the fact that much of your land is rough and hilly, that it has been in use 120 years that practically not an acre is abandoned or worn out, and that your crops are as good as I have seen this year, I must say that your farming and your results are hard to beat."

Now, while I am an ardent advocate of chemical manures, I feel certain that our past forty years of steady soil improvement under this use, as a supplement to our farm made manure would not have been as steady or as rapid had we used them independent of farm manure. Until I know more about the matter I will continue to make and apply every load of manure that I possibly can, and when I have done this I will buy and apply all the chemical manures that I feel able to pay for.

C. D. Lyon, Georgetown, O.

THE STORY OF PIKE COUNTY FARMERS' UNION

Almost six years have passed since we started our Farmers' Union. We had been talking about it for several years but all of us held the opinion that it could not be done and that the farmers would not "stick" anyway.

The trusts were holding us up, coming and going; the retailers in our little town also had everything their own way and looked with contempt upon the helpless farmer. It was irksome, almost unendurable for the thinking and more educated of the farmer class. The credit for starting the ball rolling belongs to Mr. Hirt, a drummer who had turned farmer and who most likely saw clearer than the rest of us, that the time to act was opportune. He called a meeting at Excelsior school house, about four miles west of Bowling Green. A large crowd of farmers attended and our grievances were aired as never before. Encouraged by the large attendance and the high spirits of those present, we concluded to hold a meeting in Bowling Green and invite all farmers in that territory. A few weeks later a large and enthusiastic crowd met and the launching of our "Farmers Union" was assured.

We joined a national organization called the "Farmers Equity Union," which at that time just started on new and sound principles. It has its headquarters at Greenville, Ill. From there we received our charter and by-laws. We expected to get help and advise from the national organization, but their plans were too much for the far future and too much for the great western wheat grower. We really desired little benefit from that quarter, and our newly launched Union almost fell asleep. We had no funds, no meeting place of our own, no business place, just a bunch of members who expected great things but were unwilling to put up any cash to carry out our plans.

Through the courtesy of the Pike County Bank we were able to meet in their director's room and there the plans were discussed which we finally carried out. This bank extended to us an almost unlimited credit for which a few of us signed the notes and we began to ship in by the car load everything the farmers needed and wanted. At first coal, then potatoes, cement, corn, oats, salt, bran, shipstuff, woven and barb wire, etc. Then the dry years struck us. Hard times came for the farmer, so that between the trusts and the dry years the farmers' cash and credit melted away like snow in a July sun. But these hard times proved to be boosters for our Union, nothing could ever have boosted more.

The farmers had raised practically nothing. All feed for live stock had to be shipped in. The middlemen immediately took advantage of the farmers' plight, and raised prices on all feeds beyond reason. Then the Farmers Union stepped in with the carload system. The price of bran and shipstuff was lowered at once 5 per cent, that of corn and oats 10 cents per bushel, of potatoes from 60 cents per peck to 80 cents per bushel. And so on along the line. The Union did an immense business. We sometimes had as many as four carloads of corn at a time on track. We sold everything at a very small profit, but we soon earned enough money to build a warehouse on the railroad track which we sorely needed. After that things moved a little easier and faster for the Union. We had now business enough to hire a manager and also start a store in town. We organized the Union as a stock company under the State laws of Missouri, according to the plans of the National Union of Greenville, Ill. By the way, our State Laws are not very friendly towards a cooperative concern. Missouri needs a law in this respect like the State of Kansas has already had for several years. Last year we gave up the store in town and bought a $2,000 property with a large warehouse on the St. Louis & Hannibal R. R. track, opposite the depot. We sold our old warehouse and with the money build a good sized office and meeting hall, adjoining our buildings on our present location, and furnished it.

We extended our business in adding to our stores coal, chicken feed, flour, oil meal,, hay, etc. We handle everything now on a fair margin, that means a profit almost as much as a fair minded merchant expects to make. The net profits at the end of our business year July 1, are refunded to our members as follows. Five per cent is paid on the capital stock, no more, no less. The rest is prorated according to the business that each member has done with the Union. Last year a proration of 6 per cent was declared. Several of our members had done a business of almost $1,000 and received accordingly a rebate of almost $60.00 cash.

To get the benefit of this rebate it is necessary for a member to take at least one share of stock which costs $25.00, no one however is allowed to hold more than four shares or $100.00 of stock. Those who bought less than their allotted four shares will not receive their annual proration or rebate in cash, but in additional stock until they own their four full shares. Thus it is made very easy for the less fortunate to become stockholders and the wealthy ones are constrained from holding a majority of the stock and thus controlling the Union. Right here I wish to mention that under this system our Union has in the past year done a business of over $50,000. Going some? Yes. But it is only the beginning.

Recently our Union purchased a portable Lomestone Pulverizer, which will be moved from one locality to another, where good limestone is located and farmers desire to sweeten their lands for clover and alfalfa. We also have begun to handle eggs, by careful grading and handling. We expect to sell our Union Eggs in St. Louis at a premium. Friday the 17th of March we will have a large meeting in Bowling Green in the moving picture theatre, where Professor H. L. Kempster of the Missouri University will lecture on successful cooperative marketing of eggs and poultry and illustrate his lectures with lantern slides and charts.

We hope to be able to educate the poultry raisers sufficiently that they bring us always fresh eggs and during the summertime unfertile eggs.

The Union provides quite often for such lectures and entertainments. Every 4th of July the Union gives a great picnic and fish fy at which occasion the children are entertained with different games and small presents, local talent is drafted for oratory and the University of Missouri always furnishes a lecturer and as a rule the day is enjoyed by old and young.

The University of Missouri has done much for our Union, always sending their best men to help us out. Twice they held here an extension course which was well attended.

Now the question will naturally arise "What will such an organization do to the local merchant or retailer? Will it ruin him?"

"Will it ruin the home town?"

When we started our Union we met with great opposition from this quarter. We were told that we would send every merchant or retailer to the county farm and kill the home town beyond any possibility of resurrection, if we persisted in our plans.

We however could not see it that way, we believed competition to be the life of trade, we said so and went ahead.

Now let us see how it has come out. Six years ago our town was in as sorry and delapidated a state as I have ever seen a town. About a quarter of her stores or business houses were vacant. The buildings were unpainted and dirty and without repair. The hitching posts around the square had rotted and were broken down only a few remained, and these were sufficient to accommodate the few farmers who occasionally came to the deserted town. Look at the same town today! Not a vacant store to be seen, none for rent for love or money. Several new business buildings erected, old ones remodeled, painted, and cleaned up. New hitching posts and plenty of them around the square and always at a premium. Our business men have not gone to the country to farm, but in spite of the hard times are prosperous and so is the town. No resurrection is required. What has brought about this change?

Several factors.

The retailers and merchants saw the success of the Farmers Union, so they followed our example and also organized. Instead of fighting our Union they invited the farmers to become members of their booster club which a good many did. Now both organizations are working together and any enterprise of merit is boosted by both.

90 bu. per acre from stump land!

When David Bennison of Iowa bought a sixty acre tract of Cypress covered land near New Madrid, in

Southeast Missouri along the Cotton Belt Route

the neighbors laughed at him. But Bennison knew good corn land. He cleared that tract, planted corn, and the first yield—grown among stumps—brought 90 bu. per acre. The wonderful depth and fertility of soil there is amazing. 90 bu. per acre there is better than average but not uncommon. Mr. Mahoney of Dexter, Mo. says "Last year our corn yielded 75 bu. per acre. We have made 90 bu. and it will run above 60 bu. an acre year in and year out". Mr. Hunter of New Madrid says many of his fields of corn average 80, 90 and 100 bu. per acre. There isn't a richer soil in America than that in Southeast Missouri.

There isn't a section anywhere where you can buy rich land so cheap that the first staple, field crop will pay for its cost and clearing (if you buy unimproved). And that rich soil makes wonderful yields of anything. C. D. DeField of East Prairie says "We cut our alfalfa every 28 days; five times a season. It averages a ton per cutting. Clover does well; in fact any kind of feed or pasture, I raised 40 mules last year without doing any winter feeding at all. Cattle and hogs go through winter here without feeding." 90 bu. per acre corn land at $35 will go quick; act!

Free book—illustrated!

A farmer wrote it; and he knows what you want to know about a section new to you. Tells about character and cost of lands, climate, crops raised, etc., and about schools, churches, towns, social conditions. Brimful of actual photograph pictures "taken on the ground." Send today and get this free book.

The great crop for soil fertility and animal feed. Exceptionally rich in nitrogen and humus. Higher protein content than alfalfa. Sow in spring, summer or winter. Write for prices.

Bokhara Seed Co., Box F, Falmouth, Ky.

In this way it has been possible to build a good many gravel roads which enable the farmers to reach Bowling Green easily almost any time of the year; and the low prices at our Union draw the farmers for as many as 20 miles. Now what is the secret of our success? And how do we hold the farmers together? It is the proration system.

We do not force a member to deal with the Union, he is at liberty to buy and sell where he pleases, but if he buys or sells outside the Union he is always sufficiently penalized through our proration system. Let me explain by an example:

One of our members bought corn from a competitor who undersold us 1 cent per bushel. If he had bought from the Union, the corn would have cost him 1 cent per bushel more, but at the end of the year he would have received on this transaction a rebate of 6 per cent. Corn was selling at that time at 80 cents per bushel so the rebate or proration would have been 4.8 cents per bushel, so in fact he penalized himself to the extend of 3.8 cents per bushel. Do you think he will ever do this again? Can you think of any system which will hold the members better than this?

What are the benefits and advantages of our affiliation with the National Union? We receive our constitution and by-laws and this system of proration from there. In organizing our local we were assisted by our able National President, Mr. C. O. Drayton, who is an expert organizer and a convincing orator. The plans of the National Union are to organize a sufficient number of local Unions so that our carload system can be supplanted by a trainload system. A beginning of this has been made in the Dakotas. Train loads of coal have been sent up there and the cars then left for distribution at the different locals. The farmers receive their coal now for almost half of the former price.

Plans are on foot to buy the output of whole factories making mowers, binders, wagons, plows and other farm implements for distribution to the locals at a big discount. It is also planned to own and operate coal mines and flour mills, also to have agents of our own in all large cities to handle all farm produce for the different locals.

Anybody interested in our Equity Union or desirous of organizing a local in his community is advised to correspond with Mr. C. O. Drayton, National President of the Farmers' Equity Union, Greenville, Ill.

T. B. Ingwersen,
Walhalla Farm, Pike County.

By Old Jim Riley

Talkin about fiddlers in hades, they certainly never wus any thicker than the Democratic candidates for guvnor of this imperial commonwealth — an the most of 'em ought to be out sowin' oats or writin' fire insurance and acknowledgin' affidavits in a cross roads town. And I never voted nuthin but the Democrat ticket at that. Don't git so all-fired busy figerin out the submarine question that you fergit to test your seed corn—for it takes ham and bacon to grease the skillet and a barrel of corn in the crib next fall will be wuth more'n a ton of international law, which don't buy no Horseshoe nor pay th' grocery bill.

BUCKSHOT BY THE PROFESSOR

Its time to get busy testing that seed corn. You can't raise a full crop unless you get a full stand.

You can nearly always tell what kind of a fellow a man is by the way he talks about his neighbors.

Why not plant some flowers in the school yard this spring? Why not try to make it look as though it wasn't a corral for young mules?

I believe the good Lord made women so sweet and beautiful and tender just to show the average man what an ornery cuss he really is.

Its either up to farmers to organize or to get wiped off the map. Its time to put on your fighting clothes—for the Lord hates a coward.

A pile of fellows have been so busy discussing international law this winter that the good housewife will have to put in half her time this summer hunting for stove wood.

This is leap year but a pile of girls will do better to leap in the creek than to leap onto a lot of the two footed creatures who are described in Webster's Dictionary as "men."

Help to make March 20 a great "Red Letter" day for The Missouri Farmer by raising a little club of subscribers among your neighbors. At least send in your own dollar.

Many a fellow has knocked big holes in his religion because the old plow which he was too shiftless to put under shelter last fall refuses to scour.

That Jim Riley person can get more "dreams" out of one pipe full of long green than you could corner in any "hop alley" in the country — and to think they would let him tell about them in a respectable paper like this.

I am going to save up all the cigars I get from candidates, grind 'em up and kill the bugs on my tomato vines with them next summer. This will be kind of tough on the bugs but at that its better than going bug house myself.

How about that boy of yours? Have you really tried to make him your friend? Do you enter into his joys and sorrows? Do you ever talk to him about his plans for the future? Why not make him a present of a couple of pigs or sheep and let him have what he can make out of the increase? Why not try to entwine his heart around yours?

What do you suppose your dog really thinks of you? Do you know that dogs are among the best judges of men in the world? Suppose somebody was to write a letter to your mules and ask for a confidential report on the kind of a fellow you really are? What do you suppose the mules would say? Of course if anybody should write to your wife, the chances are—God bless her—she would stand on her "constitutional rights" and refuse to answer.

"Sam" Jordan, the famous Missouri "Corn Man" was pacing up and down the platform of a little railroad station in central Missouri the other day. A couple of fellows were sizing him up and after a while one remarked to the other, "must be a preacher." After a bit a couple of farmers got to discussing "farmin,'. and one of them said, "There ain't no sense in killin time by testin seed corn." "Sam" overheard the remark and when he got through with them the first fellow turned to the other and said sadly, "No, he ain't no preacher."

'POSSUM HOLLER DOINS

The bunch rounded up at "Hez" Browns store the other afternoon and "Chouce" Baker set the ball rolling by slapping "Jep" Thompson on the back and saying, "Good for old Slim Face. He's got his dander up at last and what Funston will do to the "greasers" will be a plenty. He's got a whole lot more backbone than I thought he had. But I don't like the idee of givin "Old Whiskers" Carranzy the right to invade the United States of America. I'd a told him to stay on his own side of the cactus patch or—"Oh, you old fool" said "Jep," that just shows how little sense you'v got. You know about as much about diplomacy as an old blind mule. You couldn't see a joke if a feller was to hog tie you and mash your face down in it. Now here's what really tuck place. When the "greasers" shot up Columbus, Woodrow jumped up in the air, cracked his heels together and said "here's where I lose that watchful waitin stuff"—and then he telegrafed to Fred Funston and told him to wake up th army—that he'd like to borrow it a little while. When old Carranzy heard about it and found out that we was goin to invade the sacred soil of the Republic of Mexico he figgered out that he'd have to do a little invadin himself. He was afraid that Villa would set up a loud holler about that sacred soil bizness and that a lot of greasers would follow him. So he up and lets out a loud roar an tells Uncle Sam that if we are goin to play around in his back yard he's got to have th right to play in ourn—and that if we don't grant it he'll fight us, long as hes got a whisker left. He was just pullin off the same kind of stuff that the politicians feed us on when they git in close quarters. "Chauce" here has stood for the same kind of bunk lots of times from "Teddy," only he didn't have enough sense to know it. Woodrow understood that Old Whiskers was just tryin to square himself—and so he said, "Thats alright old sport, right you are—and so every thing is lovely and th furs goin to fly." "Jep" reeled off this line of talk so fluently and with such an air of assurance that all old "Chauce" could say was, "Well, anyhow wou'd better watch Old Whiskers. I'd ruther trust a sheep killin dog anytime than to trust a greaser."

Every farmer who has an orchard ought to spray his fruit. Write to the Hays Pump & Planter Co., at Galva, Ill., for full information, and mention this paper.

For $7.50 the Chicago Flexible Shaft Co., Chicago, will sell you a clipping machine which will enable you to remove, in a few moments, the coat of winter hair from your work horses—and it will save its cost in the extra work you get out of them this spring.

Going to need some new automobile tires? Then you should by all means drop a line to the Firestone Tire & Rubber Co., at Akron, Ohio, and ask them for their latest prices and information on tires. Be sure to mention this paper.

If you like to know what it would cost you to install a farm home furnace, write to Dept. F32, American Radiator Co., Chicago, or to the Monitor Stove & Range Co., 306 Gest St., Cincinnati, and they will send you a lot of very interesting information.

Foresight on the Farm

THIS SPRING—NOW—is the time to prepare for the storage needs for the coming season's crop on your farm.

DON'T WAIT until your corn is in the dent before building a silo—build now, and be prepared for drouth, a short season, or other emergency.

DON'T WAIT until your wheat is ready to thresh before providing bins—you know there's no time to build when the harvest is on, and it's the man prepared to hold his crop who gets the top prices.

YOU CAN get back in one season the building cost of a strong, durable, economical silo or grain bin of

Southern Yellow Pine

The Wood of Service

Prepare for the most prosperous year you ever had—the extra profits from silage—stored feed and wheat held for the top market price are the Cream of the farm income—don't be satisfied with the **Skimmed Milk.**

We will send you, FREE, the best book ever published on building and using silos; and we will send you, also FREE, detailed working plans of servicable, easily constructed grain bins, hog houses, or other farm structures. Use that Foresight and fill out the coupon NOW.

Durocs and Holsteins

The following letter from R. L. Hill will be of interest to our readers:

"We have just about sold out of our gilts bred for early farrow but we have a few real good spring gilts of 1915 farrow that we are breeding for summer litters that should go to buyers wanting big stuff with quality. These gilts are being bred for those purchasers who are not prepared to take care of real early litters.

At the present time we have a good lot of fall gilts for sale that should go to good herds. They are the kind that make for good foundation stock, for these gilts are big and growthy for their age, have lots of quality, plenty of bone, and are going to make big sows at maturity. They are sired by Col. Wonder II., 2nd prize under six months' boar, Missouri State Fair, 1913, the same year his sire was grand champion, and the following year his litter mate was grand champion sow; some are sired by Beauty's Col., a big son of the three times champion Beauty's Model Top; four of them are sired by Rexall Col., the good son of Select Col. II., 2nd prize aged boar at the Missouri State Fair in 1913. These gilts are very attractive and men who want females to add to their herds will make no mistake in getting a few of these fall gilts while they can be bought for the least money, and shipped for the least expense.

We have a few early winter gilts and some boars that are priced very reasonably and these should go to somebody starting in the pure-bred business in a small way. Of these we can furnish a pair or trio unrelated.

We have already booked several orders for pigs from spring litters. There are some herd boars in these litters by these good boars and we are making a special price on these good boar pigs to be shipped May 1. I can heartily recommend these boar pigs to purchasers who are looking for good boar pigs sired by big boars and out of big sows from a prolific strain. By buying them at this time they are priced the cheapest, they can be shipped for very little expense, and they can be grown out on green stuff during the summer and ready for fall service.

I also have one registered Holstein cow, Princess Salatine Bellfee 166873, calved Dec. 18, 1910, for sale. She is sired by Sarcastic College Pontiac and her dam is Bellfee Mechchilde. I also have her bull calf, dropped Oct. 16 1915 weighing about 350 pounds, sired by the 2000 pound bull, Olympus Pontiac Josephine."

Good Poland's at Fair Prices

The attention of our readers is directed to the change in the advertisement of H. O. Linhardt, Lohman, Mo. Mr. Linhardt has sold all his bred sows and gilts and at present can only offer fall gilts. These gilts form a very attractive lot and at the prices asked they should be splendid buys. The breeding back of these gilts is strictly big type blood. Most of them are sired by Giant Mammoth, an extra good son of Expansion Chief. This boar has extreme size and combines scale and quality. In fact, Giant Mammoth is one of the real good herd boars owned in this state.

Mr. Linhardt is prepared to book orders for spring pigs to be shipped at weaning time. Pairs or more of unrelated pigs can be furnished. This spring will afford the first opportunity to secure the get of Chief Big Bone. This boar was purchased from Fred Seviers' noted Iowa herd and is sired by Smooth Big Bone, the 1914 Iowa grand champion.

The writer has been familiar with this herd for several years and can assure our readers that they will like the kind of Polands Mr. Linhardt is producing. Kindly mention this paper when writing.

M. E. Moore & Co's. Holstein Offering

In a recent letter from W. H. Zimmerman, manager of the M. E. Moore & Co., Cameron, Mo., he reports the sale of two of his best cows to Mr. John Hill of Bevier, Mo. This firm, which has been before the public for almost thirty years as breeders of high class Holsteins, now offers ten or twelve head of cows and heifers for sale. Several of the cows listed have A. R. O. records and nearly all are from high producing dams. A number of choice heifer calves are being priced. Most of the calves are by King Ormsby Pearl one of the strongest bred bulls owned in Missouri. Mr. Zimmerman advises that he is very anxious to cut down the herd for summer and is therefore prepared to make an interesting offer to any of our readers who are interested.

Martin's Hampshires

In buying any kind of livestock it is essential that one gets as good blood as the breed affords—blood that has been proven to be right and prepotent. In buying Hampshire swine our readers can feel assured of getting the best when they place their orders with Mr. Isom J. Martin, Lancaster, Mo. Mr. Martin maintains a large herd and can therefore furnish our readers with most anything in Hampshires they may want. Mention this paper.

Smith's Jersey Offering

One of the most attractive offers ever placed before the readers of this paper is the offer now being made by J. B. Smith, Platte City, Mo., one of Missouri's leading breeders of Jersey cattle.

Stockwell's Champion, Premier Jersey Bull

Mr. Smith is now offering a number of highly desirable bull calves, sired by his celebrated bull, Stockwell's Champion.

This bull, aside from the fact that he has been made champion at many of the strongest shows in the country, is proving a sire of exceptional ability. The dams of the young bulls now in offer are among the best cows in the Smith herd, many of them have been winners in the show ring and all are of the type most sought after, and all of them have been bred and developed for heavy production. The prices Mr. Smith is now asking make these young bulls particularly attractive buys and will no doubt move them in a hurry. We therefore urge our readers who are interested to write at once. Mention this paper.

Leonard McMullin to Sell Polands at Sikeston, May 26th.

Our readers, especially those of Southeast Missouri, are reminded that on May 26th, Leonard McMullin will hold a sale of Poland Chinas at Sikeston, Mo. Mr. McMullin has established one of the leading herds of big type Poland Chinas in his section of the state and the coming sale should be kept in mind.

Report of Early & Son's Jack Sale

A great crowd of local farmers and many buyers from a distance attended the dispersion sale of C. H. Early & Son at Centralia, Mo., Friday, Feb. 18th. Col. P. M. Gross sold the jacks. Following is a detailed report of the animals sold. Chandler & Snow of Hardin, Montana, bought the three top jacks of the sale, No. 7, Shanks, $600; No. 4, Arabian, $685, and No. 6, Star King, for $1025, the top of the sale. Fourteen head were sold.

No. 1. Bert Woods, Macon, Mo., "Prince of Monroe," $330

MINERAL SUPPLEMENTS FOR SWINE

Most swine raisers understand that it requires both exercise and a sufficient amount of mineral matter in the feed to develop good bone in hogs but in practice a great many feeders who depend too much on a corn ration fail to supply enough mineral feed to develop good bone. This is not so serious a defect with the man who grows hogs solely for market as it is for the breeder who grows hogs that are kept to much greater age than market hogs are kept. But the shipper who suffers loss by the hogs breaking down in shipping must pass the loss back to the producer and so it is of some importance to all swine growers to see that good bone is developed.

In discussing this subject in a recent Bulletin of the Ohio Experimental Station, Professor E. B. Forbes among other things has this to say:

By killing and cutting up a number of hogs which had been crippled, but which by good care had been cured and sent to the slaughter on their own feet, the writer has found that actual fractures of the bones of the thigh and of ribs are common; and lameness, which may result in loss in shipping and in abbreviated usefulness on the farm, may be caused by weakened and inflamed tendinous attachments, the injuries being caused by lack of density of the bones.

By careful measurement and examination of the bones of hogs we find that the effects of deficiency of bone foods on the bones themselves is to make their structure more porous, and their walls are thinner. Deficiency of bone foods in the ration of a growing animal may reduce the breaking strength of a bone by half without restricting its growth to a noticeable extent; though careful measurements, especially of their volumes, shows that there is some effect of a deficiency of mineral nutriments upon the increase of the bones in size.

After animals have become mature, a deficient supply of mineral nutriment, especially if associated with an unusual demand for it, reveals the capacity of the animal to draw upon the minerals of its skeleton as one draws upon a cash account in a bank. Thus, the sow which is suckling pigs on a ration which is deficient in mineral matter can withdraw minerals from her bones even until they break; and then, during a subsequent period of supply in excess of immediate demands, the whole amount withdrawn may be replaced.

By a liberal allowance of bone foods during the growth of a pig you may cause an almost indefinite deposit of minerals, especially inside his marrow spaces; and the bones will be greatly increased in density and in strength, but will not look the larger on this account.

There are nutritional disorders of swine which are recognized as due to excess of mineral nutrients in the diet. Mineral nutrients in the ration in excess of the requirements are easily disposed of; either they are absorbed, and are then excreted by the kidneys (or returned to the intestine), or they are not absorbed, but are passed off in the feces. The first pathological result of the consumption of an excess of mineral nutriment would usually be a cathartic effect, and, in the use of practical foods, probably no effect more serious would be produced. The only food that I know of which is often fed to hogs, and which is apt to be injuriously laxative on account of its mineral nutrients, is sugar-beet molasses.

There are several mineral supplements which are useful in the feeding of hogs on cereal rations, when they are not on pasture. These are bone flour, wood ashes, corncob charcoal and lime. They all have considerable value as sources of calcium, and the bone flour also furnishes an abundance of phosphorus. The wood ashes and corncob charcoal contain but little phosphorus, and the lime, of course, none at all. Lime may be used as the hydrate, or in an air-slaked condition, or as the carbonate, two available forms of which are whiting and ground limestone. These mineral supplements may be fed to best advantage in self-feeders, preferably mixed with a sufficient amount of salt to insure their consumption; and they have a proper place in the feeding of hogs on cereal rations under any such conditions of restraint as make it impossible for them to "rustle" for their own mineral supplements.

From the foregoing, the reader will naturally deduce the observations that the hog which stands in the greatest need of mineral nutriment is the closely confined, growing shote, and after this one, the sow with pigs. The most useful means of supplying this need, and at the same time the greater need of the corn-fed hog for protein, is through the use of green forages previously mentioned, especially clover or alfalfa, and through the feeding of tankage and skimmilk. Alfalfa and clover hay may also be used to advantage in feeding mature breeding hogs.

Further, our own results in the feeding of hogs in comparatively close confinement lead us to doubt if any system of feeding will produce the maximum density of bone, if the animal be restrained from taking abundant exercise. I believe that the cells of the bone tissue of the hog which runs on pasture are more eager for mineral nutriment than those in the closely confined hog, and that on the same food the hog running at large would produce the denser bone. Perhaps of still greater importance than the mineral matter and the protein, which the hog picks up for himself at pasture, is the fact that under these conditions he has a greater opportunity to get away from his own and other hogs' parasites.

HOGS MAKE GAINS ON FORAGE CROPS

The profits from next year's hog crop depend on getting an early start and a good growth on the spring pigs. Grain feed is likely to be scarce and high-priced next spring and summer on account of the loss of the corn crop last fall caused by early freezing and late corn. Good forage can be made to go a long way toward taking the place of grain in maintaining the brood sow and starting the spring litter of pigs. Records of gains show that an acre of clover will give as large a gain on hogs as 1,400 to 1,500 pounds of shorts.

If good clover pasture can be provided, it will be one of the cheapest substitutes for grain that can be found. If provision for clover pasture or for forage crops has not been made, substitute crops can be grown. One of the best substitues is a mixture of a bushel of oats and one and one-half bushels of Canada field peas. These should be sown just as early as the ground is ready to receive the seed. They will make a good pasture in five or six weeks.

Dwarf Essex rape is also a popular hog forage. This may be sown early, also, though it grows faster when not sown until the ground is reasonably warm. A mixture of half a bushel of oats, three pounds of Dwarf Essex rape and two pounds of medium-red clover sown on an acre of ground about May 1 will make splendid summer feed after the middle of June. To follow this, corn sown in drills 36 inches apart with rape sown broadcast after the corn has been cultivated once or twice will make excellent late summer and early fall feed, especially for the growing pigs.

By the use of these forage crops, very much can be done to stimulate the growth of the pigs and to put them in good condition for fall fattening. If a small amount of shorts and some skim milk can be provided for the young pigs with the forage, excellent gains will be made.—Andrew Boss, College of Agriculture, University of Minnesota.

Marion Farms Palmyra, Mo.

SEED CORN

Johnson County White, the best I ever grew and all in crib by Nov. 1. Price low this year, $2.25 single bushel, $4 for two bushel bag shelled. Crated $3 a bushel, extra selected ears. Order early.

C. D. Lyon, R. 1 Georgetown, Ohio

ARE YOU GROWING SCRUB CORN?

So much has already been said on the 1916 seed corn situation that it would seem useless to say more, but in the face of all that has been said from the platform and through the press, the cold facts remain that there are vast numbers who will again plant seed of not only poor breeding but low in vitality.

Others are going to plant some well bred corn that is low in vitality.

Some again will "send off" and buy shelled seed, and some will get their seed from the common crib.

Knowing these things, one can readily see one of the reasons why our corn yield is not better than it is.

In many fields the scrub stalks will average six per cent "and up".

Why the scrub, you ask? The two chief reasons are easy. One is that a scrub is commonly bred by a scrub, and the other may lack vitality in the seed grain.

In this last case it may not be a scrub, but a runt, the same as a well bred pig may be a runt.

But in the corn, how does the runt happen? It may happen through weak vitality caused by a lack of proper plant food, but more likely on account of the freezing while both grain and cobs are yet full of moisture.

Is your corn "mellow"? I do not know what other term to use, but try some of the ears by pressing hard on the ends of the grains and see if the grains sink lightly into the cob. If "mellow", the feeling is much the same as when you try an apple to find if it is mellow.

If we were sure of the cause of this condition we might be more sure of what damage, if any, there may be.

One cause may be the wet cob shrinking away from the grain—but this would be doubtful since this condition is not found much in the tight grained ears. It may be more likely that it is caused by heavy frost while the cobs are yet very wet, causing the grains to "heave" out like a post in wet soil, or as clover heaves out. Since there was so much moisture late last fall, also early frost, it might readily be inferred that this last theory is the right one. It is true that there is an abundance of "mellow" corn.

No data is available now to show to what extent such grains may be injured, but it would seem wise to make a careful test to make sure.

If three grains are given an equal chance, and two have good vitality and one low vitality, the three may grow—but the two good ones start first, and have an advantage over the other one, and one scrub or runt will be the result.

Plant runts and scrubs—and runts and scrubs will likely be the result.

Get rid of the scrub by breeding and selection. Get rid of the runt by selection and care. Sam Jordan.

Send No Money

—In Advance on This Great 60 Days Feeding Offer.

I want every farmer and stockman to see for himself, **before he pays,** what SAL-VET will do for his own farm animals. I want you to see how it will destroy the ravenous destructive worms that are eating the high priced feed which should go to nourish your animals—how it will stop your losses from worms—how it will aid digestion making your stock thrive better—grow faster—gain in weight and value. I want to prove my claims right on your own farm before you pay me a cent. You take no risk whatever.

The Great Worm Destroyer **SAL-VET** ***The Great Live Stock Conditioner***

TRADE MARK — REG. U.S. PAT. OFF.

SAL-VET is not only superior to other preparations for ridding stock of worms and aiding digestion, but is also the cheapest; costing only $\frac{1}{12}$ of a cent a day for each sheep or hog and only $\frac{1}{3}$ of a cent a day for each horse or head of cattle. Requires no dosing—no drenching—no starving—no trouble to feed. It is a medicated salt but without antimony. Simply give your farm animals free access to it and THEY DOCTOR THEMSELVES. I want to send you enough to last all your stock 60 days. I want to show you results before you pay a penny. I get thousands of letters like these:

"When I began feeding SAL-VET to my pigs, they were very wormy, coughed a great deal, and some were runts. I have now fed SAL-VET for about seventy days, and I assure you these pigs look different. They are all in fine condition, and there is not a scrub in the bunch."
GEORGE THORNTON, Rt. No. 2, Brooklyn, Wis.

"Our sheep became infested with stomach worms and were dying almost daily. Reading of the remarkable cures accomplished by SAL-VET I decided to try it. Much to my surprise I have not had the loss of a single sheep since. SAL-VET does exactly as you claim."
JOHN E. TEMPLIN, Blanchester, Ohio

(247)

Send No Money—Just the Coupon

Now fill out the coupon—tell me how many head of stock you have and I will supply you enough to last all your stock 60 days; you pay the freight charges when it arrives and feed it according to directions. If SAL-VET does not do what I claim and you make a specific report in 60 days, I'll cancel the charge; you won't owe me a penny. Address **SIDNEY R. FEIL, Pres.,**

THE FEIL MFG. CO., Chemists, Dept. 82 . CLEVELAND, O.

Prices

Each 40 lb. pkge.	$2.25
Each 100 lb. pkge.	5.00
Each 200 lb. pkge.	9.00
Each 300 lb. pkge.	13.00
500 lbs.	21.12

No orders filled for less than 40 lbs. on this 60-day trial offer. Shipments for 60 days' trial are based on 1 lb. of SAL-VET for each sheep or hog and 4 lbs. for each horse or head of cattle. Thousands of dealers sell SAL-VET at above prices but in the far West and South the prices are a little higher on account of the extra freight charges.

"I have not lost a hog since I began feeding Sal Vet. My neighbors all arounnd me have had their hogs die. I will never do without it."—J. T. Deatherage, Ink, Mo.

"Sal Vet" is the best worm destroyer for colts and hogs I have ever used. Am very well pleased with it."—E. J. Douglass, McBaine, Mo.

"Just as you claimed, Sal-Vet is the best worm destroyer one can use. It expelled worms from my horses after other remedies had failed."—R. B. Gaines, Braggodocio, Mo.

THE FEIL MFG. CO.
Dept. 82-1-15-16 [Cleveland, Ohio

Supply me enough SAL-VET to last my stock sixty days. I agree to pay the freight, feed it as directed, and will then pay for it if it does what you claim. If it fails and I so report specifically in 60 days, you are to cancel the charge and I will owe you nothing.

OILING EARTH ROADS

Many extravagant statements have been made by those interested in the sale of oil as well as by those enthusiastic road boosters who are willing to accept most any proposition for road betterment without question, about the value of oil in maintaining a good earth road. Engineers of experience in oiling roads generally agree that the most important factor in the use of oil on earth roads is for dust prevention. True anything that will prevent dust will to a certain extent prevent mud because when rain falls on a dust laden road much of the water penetrates the road bed, whereas if the surface was smoothe and free from dust most of the water would find its way to the ditches and the road would dry out quickly and no deep ruts would be formed.

Earth streets in small towns where there is no very heavy traffic may profitably be oiled to keep down the dust and prevent mud but on streets with a very heavy usage and on country roads we doubt the economy of oiling as a permanent or profitable improvement.

The Illinois Highway Department has just issued a report on the surface oiling of earth roads in which they estimate the cost of oiling a road at from $150 to $475 a mile. "With average conditions and with a medium priced oil, the average cost of oiling alone per application may be from $200 to $250 per mile of road 15 feet wide." And on the durability of an oiled road the report has this to say: "It is predicted by some enthusiastic users that a road will not require oiling after it has qeen oiled for two or three years and the surface has become throughly saturated with oil. The writer has visited some twenty different towns that have oiled their streets for a period of more than five years and the present condition of such streets indicates that the oiling will have to be repeated each year indefinitely to secure the desired results. The quality or quantity of oil usd in the twenty towns referred to is not known. It may be that if a high grade of asphaltic oil is used that some annual application may be omitted after a few years of treatment. With the best oil, however, it is hardly expected that more than one year could elapse without some attention."

The annual cost of $200 to $250 is too great for the possible benefits on most of our country roads and we think that money can be used to better purpose than to use that amount of money for improvements lasting for only a season. Those who are interested in the subject should write the Illinois State Highway Department, Springfield, Ill., and get a copy of Bulletin No. 11—Surface Oiling of Earth Roads, prepared by B. H. Piepmeier.

THINGS OF PERTINENT INTEREST

Darling & Co., Dept. 54, Union Stock Yards, Chicago, will be glad to send you full information and prices on all kinds of commercial fertilizers.

If you are going to need a new corn planter, write to the Hays Pump & Planter Co., at Galva, Ill., and mention this paper. They are said to be putting out one of the best corn planters on the market.

The Ohio Carriage Co., of Columbus, Ohio, are putting out a great line of powerfully built farm buggies and carriages at a low price. If you are needing a new vehicle, better get in touch with them.

Not too late yet to order that incubator—and the M. M. Johnson Co., of Clay Center, Neb., and the Belle City Incubator Co., Box 166, Racine, Wis., are among the best. Write them at once.

Why not pull up the stumps and make your land earn money? The Hercules Co., at 191 24th St., Centerville, Iowa, put out the best stump puller on the market. A postal card will bring you complete information.

For $10 you can attach a "Shock Absorber" to your Ford car that will make it ride a great deal easier and more comfortably. Write to the H. & D. Co., 94 Marion St., Goodland, Ind., for information.

If you are thinking of sowing alfalfa or clover, write to the Earp-Thomas Co., at Bloomfield, N. J., and ask them to send you their literature on "Farmogerm"—the great legume fertilizer.

Why Pay War Prices for Nitrate of Soda Fertilizer? Legume Crops Inoculated with

THE STANDARD INOCULATION
FARMOGERM
HIGH BRED NITROGEN GATHERING BACTERIA for CLOVERS, ALFALFA, BEANS, and OTHER LEGUMES

High Bred Nitrogen-Gathering Bacteria for Clover, Alfalfa, Beans and Other Legumes will add the free Nitrogen in the air to your soil at the rate of $40 per acre at a cost of only $2.

Nitrate of Soda is now $80 a ton, a prohibitive price for the farmer.

You can inoculate 5 acres of Peas, Beans, or other legumes with FARMOGERM for $6. That means 5,000 lbs. of Nitrate Nitrogen going to enrich your soil. Bought as Nitrate of Soda it would cost $200.

And in addition to all this FARMOGERM produces best and biggest crops of Peas, Beans, Alfalfa, Clover and all legumes, at lowest cost.

The Demagogue

Once more the voice of the petty politician is abroad in the land and as he ambles along he leaves a trail of campaign cards, cheap cigars and still cheaper talk in his wake. With many men the hunger for public office is a disease rather than a worthy desire to render useful public service. From time out of mind a sort of glamour has attached to the holding of public office and once the germ gets a firm foothold the victim follows the game with the persistence of a gambler and frequently plays it with even greater skill—and hence, even as the gambler, there are few tricks to which he will not resort to gain his end. Again, there is another class of men who, having been failures at everything else, seek to gain a living by contracting a sudden desire to serve the people and who, though they failed in running the 'corner grocery'' assume to be able to pass upon the larger and more complicated affairs of the community with an equanimity and assurance that would be amusing if it were not dangerous. Then there is still another class—those who have succeeded in acquiring some bank stock and other of this worlds goods in goodly quantity and who covet the honor that goes with public preferment much as they would covet a string of pearls or a degenerated foreign title.

But, after all, these are the pigmies of the game and it matters little to the public who among them wins when the votes are counted. You might put the whole bunch of them in a sack, shake them up and then grab the first one your hand touched and have no regrets over your choice. But there is an individual sometimes referred to as the ''demagogue'' who plays for the larger stakes in the game of politics and who is truly dangerous because he is a seeker after power which often affects the well-being of a whole commonwealth—or possibly even the Nation. Frequently possessed in no mean degree of the art of oratory, he cultivates the mien and manner of the profouned statesman and in a fine rage tears a passion to tatters. He is above everything elsethe ''peoples friend.'' While he does not say so in so many words, he thinks the public would be in a pitiful fix were it not for his guardianship. He is a watch dog who bays long and loud against anybody but himself and his friends having access to the public treasury. He is an implacable enemy of the ''interests''—always taking care however not to tread on the toes of that particular interest which might be able to heave a rock in the path of his political progress. His raven locks are storm tossed and he moves among common men as a sort of superior being—does this demagogue my friend who above everything else is a consummate ass and who is responsible for much of the miscarriage in American government and for the chaos which rules in the world of American industry and business. Since, as a mere boy I listened to my first political tirades he has been with us even as he is with us to-day. Then, as now, he roared like a lion in the highway and yet the wolves of American industry have gone on their way undisturbed while men who had committed no wrong were hauled like so many horsethieves before the bar of a public justice which they had not offended.

With the demagogue it is not a question of what is right or wrong but solely a question of what policy will procure the most votes and make it possible for him to continue in public office. To him political parties are mere instruments to an end. What they fundamentally stand for is of no concern for he is willing to swear that the world is round or flat—which ever suits the wind of the passing hour. And you and I, my friend, are responsible for this political mountebank for from time out of mind we have permitted him to play upon our prejudices. We have applauded his cheap dramatic rage and laughed at his stale humor. We have failed to discriminate between the clown and the statesman—and until we exercise more intelligence as citizens his raucus voice will continue to rule in our halls of state.

GET MY PRICE

WAIT! Get my 1916 price! Don't buy an engine of any make or kind or price until you first get my low 1916 prices and easy buying plans, including easy terms. I build these Masterpiece engines in my great chain of factories and sell them direct to farm and shop with only one small profit added to actual cost. My New 1916, 250-Page Book illustrates and describes all sizes from 1 3-4 H. P. light work engines to 16 H. P. moguls for biggest, toughest, heaviest jobs. All Galloway Masterpiece engines are large bore, long stroke, heavy weight and low speeded. Built for lifetime service and satisfaction.

1916 FEATURES Include valves in the head, (worth $15 alone, but costs nothing extra), extra large cooling surfaces, perfected oiling system, economy carburet or (a fuel and money saver, worth $10 more—costs nothing extra on the Galloway), built-in magneto and Hercules water-cooled cylinder head, an arch of strength, mechanically perfect in design, (worth $25 extra, but costs you nothing!)

AK-6

LOOK! This new 1916, 250-page Book tells all about these features and many others that make Masterpiece engines superior engines and power kings in every field. Don't do a thing about buying an engine until you first get my book! Every sale backed by $25,000 bank bond guarantee, for every customer's satisfaction! Shipped from Waterloo, Council Bluffs, Kansas City, St. Paul and Chicago. Ask for my SPECIAL PROPOSITION on 10,000 engines and new book today. Address

MAINTAINING A STAND OF CLOVER

The Missouri Farmer:

I notice the credit on the label of my copy of The Missouri Farmer is back and I have a feeling that it will look better to have it moved up three years, so send the dollar.

I appreciate the good paper you are giving us. I had thought I would do some experimenting or at least try some of the things you tell us about but I am one of those unfortunate ones who never have the ready money to buy fertilizers and seed in proper season.

I thought to buy some orchard grass, meadow fescue, brome grass and other grasses and some of the legumes but I bought another piece of land this spring and my experiments will have to go over another year.

I missed your first article on clover but read your second and let me say that is the kind of matter I take the paper to get. I hope you will follow the clover article with a series of articles on the grasses and I think others as well as myself will appreciate it.

A friend of mine who lives on a white oak ridge farm—which land by the way is the best clover land we have—complained to me some years ago that he could not maintain a stand of clover and I suggested to him not to pasture his meadow after cutting before freezing weather. He was growing clover and timothy mixed and as soon as he made his hay he fenced his stacks and turned his stock off the meadow.

By keeping the stock off the meadow until after freezing weather the clover had time to mature a seed crop which of course kept the land re-seeded all the time. This friend followed my suggestion and since that has experienced no more difficulty in maintaining a stand of clover.

Joseph Stewart,
Mill Grove, Mo.

Editorial Comment: We appreciate the above expressions of approval from so good a friend as Mr. Stewart has proven himself to be. We will endeavor from time to time to cover the questions mentioned with special articles. The plan mentioned for maintaining a stand of clover with timothy is about the only successful one. Clover is a biennial plant and must have a chance to reseed in a natural way or it will die out. The clover that is sown this spring will not under ordinary conditions produce any seed or at most very little seed this year. Then next year it will do its full work in the production of two crops the first a hay crop, the next a seed crop. However, in very wet or favorable clover years there may be a lot of seed produced the first year. It is seldom though that this crop will pay to harvest though in exceptional cases it may. If this first crop seeds heavily the second year will find as a rule a thin stand and a weakened condition of the plants and so it is generally better to keep the first year's crop back either by pasturing or by clipping so that it can do its best the second year.

Mr. Stewart's plan of letting the clover have time to seed in mixed meadows is the best practice for two reasons. First, because it allows the clover to reseed the ground and perhaps of greater importance is that the extra growth of timothy will protect it through the winter and the grass will start earlier the next spring. Two things every farmer should strictly observe if he wants good grass either in meadow or pasture are first not to pasture the grass too close late in the fall; second, let the grass have a good start before it is turned on in the spring

To Ford Owners

RIDE EASIER

Don't worry longer about rough roads or hard steering.

Equip your Ford with the famous Aitchandee Shock Absorbers—now used by over 50,000 farmers in all parts of the country.

Because of our enormously increased output, the price has just been reduced to $10 instead of $15.

STEER EASIER

Commence to really enjoy your car. Our cantilever principle removes these side slaps and thrusts and makes steering easier over rough roads or at high speed. This principle also gives that much desired different tension between the upward and downward thrusts. Comfort is assured.

Sudan Grass Hog Pasture

Please let me know if the second crop of Sudan grass would make good grazing for hogs!

A. C. Brockman,
Audrian County.

Sudan grass is rather a new crop in the Corn Belt and so far as we know no extended experiments have been made with it. Personally we have had no experience with pasturing it but from the nature and composition of the plant we would expect about the same results from pasturing Sudan grass as we would get from sorghum. We would expect the land to pay a good rental by pasturing a crop of Sudan grass but we would expect a much better profit from rape, clover, sweet clover or alfalfa. If any of our readers have tried Sudan grass for pasture we would be very glad to have them report their experience to The Missouri Farmer.

Says Some Are Politically Blind

The Missouri Farmer:

After reading "It's Up to You" in March 1 issue of The Missouri Farmer I opened my eyes and now send you a dollar to help you out in your undertaking and if you need another dollar from me let me know—I am with you. I sincerely trust enough Missouri farmers will send in a dollar to put you entirely to the good.

I have liked the paper ever since the first issue which came to me through the courtesy of the Polk County Bank.

I am having a hard row to hoe of my own for I have a big mortgage and a big family to support and I feel the need of your help in many ways. So far I have not been able to get my neighbors together in an organization. I am for the Garner Land Bank and all good reform measures but I find some so politically blind that they see nothing good unless it comes from their own political party. If 49,999 other farmers will do as I am doing, The Missouri Farmer can become a great force for the good of us farmers.

F. P. Hendershot, Bolivar.

RED LETTER DAY LETTER.

The Missouri Farmer:

Having read your plea, "It's Up to You!" we wish to be counted among the 50,000 loyal ones, and are enclosing our renewal, although our subscription is marked up to "Aug. '16."

Wish we could send a club or at least another, but will have to let our "own dollar" suffice this time.

We have enjoyed your paper very much and think every farmer in Missouri should be a subscriber.

During the past year we tried canning eggs by your water glass directions also tried your "Douglas Mixture" as a tonic for turkeys—think both fine, and worth the $1.00 subscription to us.

We are using the last dozen of eggs canned last June, which are perfectly good, and have made delicious custards this week.

Our eggs were put up in 2 qt. Mason jars with tops kept on, and liquid apparently has not evaporated any—we did not use rubber rings, but set the jars in 3 lb. coffee tins and kept in cellar.

We would like to know if the canning fluid can be used again? We have always used a sterilized silver spoon to dip the eggs out. If you can give us this information in some future issue would greatly appreciate it.

We wouldn't part with our copy of "The Missouri Farmer's Hand-Book" for the price of the paper.

Yours for "Red Letter Day" success.

Mrs. S. E. Shelley,
St. Louis, Mo.

Reply: We have asked the agricultural chemist of the University about using the water-glass solution again and it is his opinion that when the solution has been kept clean it will be all right to use it again by adding about one-third as much water-glass as was used the first time. Some of the material has been used up and to have the solution of proper strength some more of the water-glass should be added.

Whitewash the Outbuildings

This is a good time of year to clean up and make things look tidy and then it helps prevent disease, particularly about the hen houses and hog houses. When these buildings and the fences are of native lumber and it is too expensive to paint them a mighty good substitute is a good whitewash. An old tested formula for a durable whitewash used on some of the government buildings is as follows:

Slack one-half bushel fresh lime with boiling water, covering it to keep in the steam. Strain liquid through a fine sieve and add seven pounds of fine salt, previously dissolved in warm water; three pounds of ground rice, boiled to a thin paste and stirred in, boiling hot; one-half pound bolted gilders' whiting; one pound white glue, soaked first in cold water until swollen, then carefully melted over fire. To this mixture add five gallons of hot water and let it stand covered a few days.

A pint of the whitewash will serve to cover nearly a square yard. It is very white and will last well when used on outside jobs.

The Missouri Farmer

OLUME VIII APRIL 1, 1916 NUMBER 7

A State Farm Market Bureau

By William Hirth, Publisher

As this issue of The Farmer is being tten ready for the press, farmers are sy sowing oats and soon they will ell off their coats for the annual ttle in the fields upon which so much pends during each recurring year. therefore realize that we are on the reshhold of a period when the aver-e farmer will be too tired to do uch reading after he comes home om his days work—and yet I want send this final message to our read-s on the Farm Club question in or-r that they may think it over as they llow the plow, harrow and cultivator ring the next few weeks. Then we ill let matters stand until the rush spring work is over when I trust e may get into the fight again with reater zeal than ever before.

What I wish to make the burden of is article is a plan which has recent-been conceived in the office of The issouri Farmer and which contem-lates the creation of a State Farm larket Bureau with an active general ecretary in charge. As our readers o doubt recall, a farm marketing con-erence was held in Columbia during he recent Farmers' Week and in the ear future the Executive Committee ill get down to a working basis—but he idea which is here advanced will, believe, be an absolutely essential eature of any program that may be dopted by the above Committee while, n the other hand, it is a plan which an be carried into effect independent-y and hence we place it before our eaders at this time for their careful onsideration.

Simplifying Co-Operative Effort

That even a small school district Farm Club with 15 or 20 members can save a lot of money for the farmers who belong to it has been demonstrat-ed time and again and numerous splen-did instances have been cited in re-cent issues of the paper. A reference is made to the Wade Club of Boone county elsewhere in this issue. Now, if a small school district club can give such a good account of itself when acting single handed and alone it naturally follows that 25 or 30 clubs in the same county working through a strong county organization could still do much better—and it is for this reason that we have so strongly urged the organization of County Farm Asso-ciations as soon as there are a suffi-cient number of clubs within a given county to warrant it. But still more powerful and absolutely necessary to this great movement is a State Farm Bureau in charge of a high class Sec-retary who can be at the constant beck and call of every farm organiza-tion in the state. Even with the pres-ent movement just getting fairly well started I already realize the crying need of some one whose entire time is devoted to the work of helping the different farm clubs solve their prob-lems—and this is true whether it be just a small shool district club or a County Farm Association. Surely such a man would tremendously sim-plify the work we have in hand and when the members of a farm club are in need of a car load of bran, ship-stuff, hay, oats, cotton seed meal, fer-tilizers, coal or other like commodities the Secretary of the local club could make his wants known to the Secre-tary of the State Bureau—and by cen-tering orders from all over the state in this one mans hands he would be able to drive a bargain which would be impossible for the smaller organiza-tion units. Just think of the buying and selling power which would be concentrated in this mans hands if he bought and sold for one thousand Mis-souri farm clubs?

Just A Few Items

In many parts of Missouri, far re-moved from coal mines, the farmer is compelled to pay an unnecessary trib-ute on coal. If through the State Market Bureau—which could buy on the lowest basis direct from the big mines—a saving of only 50c a ton was affected on 200,000 tons it would mean a saving of $100,000 to the farm club memebrs who purchased it. As a mat-ter of fact, however, more than double this sum in all probability would be saved on this one item alone during the course of the average year.

In the buying of feed it is no exag-geration to say that a million dollars could be saved during the average season—the amount depending very much of course upon conditions and the amount purchased. Likewise, the purchasing of many kinds of farm seeds could pass through the State Bureau to advantage.

In an average year the farmers of this state purchase 75,000 tons of fer-tilizer—and if the State Bureau placed orders for 50,000 tons and only saved $1 per ton it would mean $50,000. Like-wise there are other items such as tankage, cotton seed meal, etc.

That even the small school district farm club can save a lot of money by co-operating in the purchase of the above commodities is undoubtedly true as we have pointed out in numerous articles during the past winter—but what we have in mind in this brief outline of a State Farm Market Bureau is, first, to bunch these orders from the different farm organizations in order that the rock bottom price may be ob-tained in every instance and secondly, by means of this Bureau to create a "right hand man" for the officers of every local farm club in the state—a man whose entire time is devoted to serving them—who can find out where the best commodities can be had at the lowest price and whose help would tremendously facilitate and simplify the work ahead of every farmers or-ganization in Missouri. Instead of every farm club having to ferret out these things for itself, this man in charge of the State Bureau could do this work for all of them—and do it at a big saving over what the small club could save by acting single hand-ed and alone—a saving which would pay the expense of maintaining the Bureau many times over.

The Selling End

But the buying of things would be only a part of the State Bureaus' work. Its services would be equally as val-uable in the selling of many things produced on the farm. Of course, while the Packers control the meat industry as absolutely as they do at this time, little can be done in this field until this ruthless Combine is broken up—and yet, in the selling of eggs, poultry, apples and many other farm commodi-ties, the time would not be far distant when the State Bureau would make itself powerfully felt and when it would be able to affect a saving for the farm club members of the state run-ning into hundreds of thousands of dollars annually. If the Bureau sold 500,000,000 lbs. of wool direct to the big wholesale dealers and only saved two cents per pound it would mean $100,000. Thus, can't you see, my friend, how splendid are the possibili-ties back of this idea?

As to the cost of maintaining such a Bureau, it is safe to say that a high class man with aptitude for the work and with a good business training could be had for a salary of $3000 per year. But suppose that the total cost of the Secretary's salary, stenograph-ers, office rent, stationary, postage, etc., ran up to $10,000 per year—could the farmers of this state possibly make a better expenditure? I trust that this article may be read to the members of every farm club in the state at an early date and that we may have an expression from the Secretary as to what the members think of the plan.

A Great Fight

In passing, I want to say that The Missouri Farmer has enlisted in this great fight because it believes that present marketing conditions are im-possible—that they gravely menace the future of the American farm and the well-being of the entire Nation. What other farm paper that circulates in Missouri has done as much—or, for that matter, what other farm paper anywhere in the country has gone af-ter these conditions with so much fear-lessness and candor as has The Mis-souri Farmer? We will let the reader make his own answer. All we ask in return is that the farmers of Missouri give us sufficient support to make our efforts effective—for upon this every-thing depends. I am deeply grateful to those who have gone to their neigh-bors and asked them to back the fight the paper is making by subscribing for it—often refusing to take enough out of the subscription money received to cover postage of sending them in. Likewise I am thankful to those who have sent in their renewals—but in any event those behind The Missouri Farmer are going to do their best to cary to a successful conclusion the great task they have undertaken. That our labors are not unappreciated is evidenced by the fact that many farm clubs have sent in a club of subscrip-tions including that of every member—and so, after the rush of spring work is over, I trust that the fight may be taken up anew and that we will not cease in our efforts until farm clubs have been perfected from one end of the state to the other. In this con-nection, I hope the farm clubs of the different counties will plan a big two days County Farmers' Picnic — and with several good speakers provided for this occasion, perfect plans for a County Farmers Association, and the further extension of school district clubs.

Good Farming Methods

In conclusion, standing as we are on the threshhold of another years crop, I hope tha every farmer who reads this paper will resolve to make his fields give a good account of them-selves and that to this end he will ex-ercise more care than ever before in the selection of his seed, the prepara-tion of his seed bed and methods of cultivation — for this is an essetnial part of the creed of every good farm-er and upon the care and thorough-ness with which we execute these things depends the harvest.

ATTENTION FARM CLUBS

We are going to open a "Farm Club Dep't" in The Missouri Farmer and under this head the Secretaries of the different farm organizations in Missouri may tell their experiences or ask questions which other Secretaries may be in position to answer. In other words, we want to make this Dep't a sort of "Clearing House" for the Farm Clubs of the state and trust that our friends will help us to make it thoroughly worth while. If your Club has done some particularly successful thing, all the other clubs will be glad to know of it and vice versa. We trust that we may be able to start this Dep't off in fine fashion in the next issue and therefore trust to have a report from a lot of secretaries on an early mail. Just tell us a few words about your organization, what you have accomplished or what you hope to accom-plish.

SOY BEANS AND COWPEAS WITH CORN

The crops that are most commonly used as supplements to corn are cowpeas, soy beans, rape, wheat, rye or barley. When wheat, rye or barley is used, they are sown either just ahead of the last cultivation or later in the season with a one-horse drill. The latter is possible only when the corn stands up well. This practice is perhaps successful two or three times out of five. Dwarf Essex rape is often sown ahead of the cultivator at the last plowing. The success of this plan depends upon the season as well as upon other conditions. If the season is favorable, with plenty of rain, the rape will make a good growth. It will not thrive, however, in hot, dry weather. If the stand of corn is thick and heavy the rape will be shaded too much to grow well.

The most common practice with cowpeas and soy beans is to plant them in the hill with the corn at the time of planting the corn. Where this is done the number of peas used per hill should be about the same as the number of grains of corn per hill, both to be determined by the varieties of corn and the quality of the soil. Soy beans appear to stand a little more cold than cowpeas and in many localities soy beans seem to be preferred to cowpeas.

Another practice has been to drill the "New Era" cowpeas between the rows at the time the corn is laid by, laying the corn by a little earlier than is commonly done in order to give the cowpeas a start before the corn shades them too much. The success of this last plan will be measured very largely by the time we get them planted, the quality of the soil and the season. The plan should prove successful perhaps three times out of five. Where it does succeed and the cowpeas are gathering plenty of nitrogen and where they can be pastured off by turning pigs or lambs into the field, the benefits to the soil are very great, in addition to a large amount of feed that sometimes may equal in value half of the corn crop growing on the ground. For sowing cowpeas as above described it takes from one-fourth to one-half a bushel per acre, and if the work is done with a one-horse grain drill, made for such purposes, it is usually advisable to stop up at least two of the drill holes and plant not to exceed three rows of peas. If soy beans were used in this way perhaps two rows might be better than three since soy beans will not stand crowding as much as will cowpeas. By planting the peas or beans in the hill with the corn, which is the most common method, a bushel should plant from twelve to thirty acres, depending on the number of beans or peas per hill, the distance apart of the rows and the size of the grains of the beans or peas planted. The size of soy beans vary greatly. The Mammoth Yellow, being large, one bushel will plant from twelve to fifteen acres, while the Peking will plant from twenty-five to thirty acres. These rates are on a basis of three per hill, three and one-half feet apart each way. The depth of planting has an important influence upon the stand. Many persons secure a poor stand when planting with the corn by planting too deep. We are accustomed to letting the corn planter down pretty well, which is perhaps safe enough for the corn, but it is risky for beans, especially if planted early. Much, of course, will depend on the conditions of the seed bed and the warmth and moisture of the soil.

The soy bean is meeting with great favor for all the purposes that we formerly used cowpeas. Soy beans do not vine but stand well, interfering less with the cultivator and in cutting the corn for silage or fodder. When they are to be pastured with lambs or pigs they are preferred to the cowpeas, because soy beans produce seed or grain much more heavily than do cowpeas. Where we desire to make hay of them or grow them for seed they have the advantage of cowpeas in being a little easier to cure. They produce as much hay and usually much more seed, and weevil do not molest the seeds. Soy beans or cowpeas are grown in corn for three purposes. One is to add fertility to the soil, another to furnish a crop to be pastured off in the field, and another to put into the silo or for fodder. It should be kept in mind that soy beans do not seem to gather nitrogen in new soil quite so readily as do cowpeas. For this reason, when we are using soy beans for the first time I believe it would be highly profitable to inoculate the seed with bacterial cultures. If no nodules are being produced on the roots of the soy beans they are not benefiting the soil any more than a weed might do. It should be remembered that the soy bean seems to get its nitrogen and grow the nodules to the greatest extent up to the time the beans blossom. If we make no examination until the beans ripened we are not likely to find any nodules, since they have disappeared usually, and we might naturally conclude that there had been none.

The use we desire to make of the growth will determine very largely the variety that might be best to grow. Where we desire them for silage or to cut up for fodder with the corn, the Mammoth Yellow, the Medium Yellow and the Jets or Wilson give ve y good results, since they all attain good height. The Mammoth Yellow, a very late-maturing variety, frequently will not mature seed as far north as Central Missouri, but the other varieties named will ripen seed under average conditions. Where the object is to turn pigs or lambs into the cornfield, the Mongol perhaps heads the list for Central Missouri. The Mikado is a very good one. There are a vast number of varieties, and in this discussion only those are mentioned that have been given a trial.

The Ito-San has been the earliest tried and the Peking seems to thrive better on poor soil than some of the others. The Medium Green produces seed heavily, but the plants were very short and the seeds shattered badly. This one, however, would be very good where pigs are used for the pasture.

Another item in favor of the soy bean is that stock seem to relish the green soy beans better than they do the green cowpeas. A most excellent practice to get the best results would be to fatten lambs or sheep in the cornfield planted to the beans or peas and then fence off a small section at a time and allow the hogs to gather the corn. If we do not have sheep for the purpose, hogs will clean them up perfectly, but are likely to destroy a little corn; however, they will not bother the corn much as long as there are plenty of beans.

Where we pasture off both the corn and beans as indicated we will find that the succeeding crop on such land will act about the same as if the land had been well manured. This is plain for the reason that the animals fed on the land carry very little away from it, except the fat that they have put on their bodies, and it should be remembered that animal fat is not soil fertility. This method is a great saving of labor in the way of harvesting the crop, of feeding it and hauling manures back to the field. Some people have referred to such methods as being the lazy man's way. There is a vast number who can testify that it is not a "fool's" way. It simply indicates that a man has been mixing a little brains with his muscle, and brains and muscle, with the addition of plenty of hustle, is the best combination in the world.

Soy bean and corn silage has a greater feeding value than corn alone, and on the ground that commonly produces twenty to twenty-five bushels per acre of corn there may be grown from one to three tons per acre of bean silage in addition to the corn crop. It often happens that the pasture remaining after the corn and beans have been put into the silo is worth $1.00 to $2.00 per acre. If there were nothing left, however, but corn stubble, we couldn't brag very much on the pasture.

Sometimes in the spring we may plow under a field of rye that we have been using for pasture, and at times, when chinch bugs are bad, if we should follow the rye with corn we are likely to get into serious trouble from the bugs. In an event of this kind soy beans could nicely follow instead of corn, since chinch bugs do not molest the soy beans. These things are urged for the reasons cited through this discourse, but for fear they might have been overlooked it might be well to sum them up again.

Our acreage yield of corn on an average is so small that it is a large question whether by growing corn alone we could pay for the land; consequently we must not only get more out of the soil, but we must maintain its fertility at the same time, a great amount of labor may be saved and a greater amount of live stock necessarily used on the farm are the primary objects to be kept in view.

S. M. Jordan,
State Board of Agriculture.

SOW RAPE FOR HOGS

Forage crops furnish the best possible way of cheapening the cost of pork production if we can trust the experience of the Missouri Agricultural Experiment Station and of numerous hog feeders. High priced grain must be used to a certain extent, but cheaper crops may be substituted for a part of it. The Missouri Station experiments show that the five pounds of grain required to produce a pound of pork in dry lots may be reduced to three pounds if the hogs are running on alfalfa, rape, clover, sorghum, or blue grass. The average return per bushel of corn fed was 66 cents a bushel in case of dry lot feeding as compared with $1.10 when the hogs fed were running on pasture.

Economy of work and better effect on the fertility of the soil are also secured by hogging down, so the forty per cent saving in grain feed does not tell the whole story. Hogs on pasture nearly always drop the manure where it will do some good, but this is rarely the case if dry lot feeding is practiced. The grain feed keeps the animal in better health and free range gives him a chance to keep himself more nearly free from lice and worms.

Among the forage crops tested for pork production, alfalfa stands at the very top because, (1) its long growing season enables it to furnish both early and late pasture, (2) it is drought resistant and does very well on the driest soils and the driest parts of th growing season in Missouri, (3) it high protein content makes it especial ly good for balancing the corn in th ration.

Clover ranks next to alfalfa and fit into corn-belt rotations much bette It is similar in composition, but doe not furnish pasture as early or kee as many hogs per acre.

Dwarf Essex rape is the best of th crops that must be sown each yea It may be sown alone or broadcast a the rate of six pounds per acre afte which a bushel of oats per acre ca be drilled in. Sorghum is also to b recommended and blue grass is ex cellent, especially for early and lat pasture, but it is likely to take a res during a hot, dry summer. At suc times the green succulent sorghu will be very acceptable.

L. A. Weaver,
Missouri College of Agricultur

STATE AID FOR RURAL CREDITS

Many in this country are oppose to State action on the ground that th State is incompetent and that all thi should be left to private enterprise There is much meaningless talk abou what can be done through cooperation A conclusive answer to this is the suc cess of those Rural Credit system operated with funds provided by th State in countries with conditions an needs like ours, and the absence of a single successful system of land set tlement through either private or co operative rural credit where the con ditions are like ours. Germany with that thoroughness and business sagac ity so characteristic of the nation did not attempt to employ the Landschaft or any other cooperative system in aid ing German farmers to become land owners in Poland or Southwest Africa. Instead it adopted direct State action, identical in its working features with the system of New Zealand and the Australian States.

The Only Adequate Authority

The State is the proper authority to provide the money. It is the only authority in a developing district where all men are borrowers, where values are being created, where the people are new to each other and where they are strongly inclined to be individualistic, that can provide cheap money. And the State has reasons for doing this that do not prevail with either private or corporate enterprises. The basis of State action is the general welfare, the creation of better conditions in rural life, the bringing into cultivation of unoccupied land, the increase in taxable wealth and trade and commerce. All these things are gains for the public, of which the State is the representative. The Federal Government and the States own much of the land to be peopled. The Federal Government has about $100,000,000 invested in irrigation works. The financial return from those works and the welfare of the settlers living under them can in no way be so effectively helped as through the establishment of a State or Government Rural Credit system like that of Australia. The money for these loans in Australia comes almost entirely from savings banks. If the Federal Postal Savings Bank system in this country was changed so as to make the interest rate 3½ per cent and the limit of deposits $2,000, there would be an ample fund in this country with which to carry out this work.

In addition the State has already in its experiment stations and the officers appointed under the Smith-Lever bill a body of expert advisers familiar with

al conditions. It would only need increase in their number to do all t is being done by the advisers of Rural Credit system of Australia, l with the power that this system uld give them their influence would far more potent than it now is, and progress of agriculture correspongly accelerated.

The Duty of the State

f we adopt this system we will have experience of a number of couns to guide us; we do not have to ak any new trails. It will be in sense an experiment. It will be rusting the creation of new comnities and the shaping of their sol and industrial life by the only hority which should exercise that ver and the only one that has the ources, the continuity of existence, disinterestedness needed to insure results desired. There need be no r of the ability of a State to render irect service to the people and to do s with economy and efficiency, if management is made non-political l placed in the hands of competent n who have a long tenure of office. ring the last 30 years I have worked private enterprise and for the te, and it is my conviction that men l work harder for the State and in interest of public welfare than y will for a corporation whose mo- is profit. I am quite sure that re is no corporation in this country ose employes worked harder for ger hours or took keener interest their work than did the officers of Victoria connected with the manment of its Rural Credit system. If s system is made non-political and in its working methods there is inporated the safe-guards that have de the Australian system so conuous and so conspicuous a success, those incorporated in the British lumbia law, or outlined in the report the Wisconsin State Board of Pub- Affairs, there need be no misgivgs as to the results.

Dr. Elwood Mead,
University of California.

ANOTHER BREED OF HORSES

Alfalfa has increased the value of ery acre of land thus cropped from to 100 per cent, and yet people are w to adopt it. I am wondering if same mistake is not made by the mers of the Corn Belt, contenting emselves with horses too small to profitable on the farms, not needed the roads since the invention of automobile and paying exorbitant ices for ton draft stallions shipped m foreign countries. The draft rse has his place, but his place is t the only one on the farm. The actors are now doing the plowing. a recent tractor exhibit in which actically all tractors were reprented, I made inquiry as to what prosions were being made for cultivatg the corn crops. The reply was his will have to be done with rses" and yet we have no pure bred rses of the right size.

I should like to have this subject scussed by the readers of The Misuri Farmer. Do we need an Assoation for the breeding of wagon rses? The object of this Association ould be to co-operate with the farms and horsemen in establishing a w breed of horses to fill the missing nk between the automobile and the ft horse.

The Wagon-horse from a farmer's andpoint must have weight enough pull the plow and not be too heavy r the harrow and cultivator on soft round; active for the mowing machine and wagon, and to take the place of the automobile on muddy or rough roads. Above all, it must have flesh-carrying qualities, thus having the commercial value at any time the farm can spare it.

Wagon-horses for city use would include a group of horses used principally where the business requires a quick delivery. Such horses must be closely coupled, compactly built with plenty of constitution and stamina. They must be good actors, have a good, clean set of limbs with good quality of bone and foot that will stand the wear of paved streets. In this class are express, delivery wagon, artillery and fire horses. All of these must have depth and rotundity of body, smoothness and finish of conformation and be of rich solid color (star in the forehead and one white foot preferable). Height 15 to 16 hands, weight 1100 to 1400 pounds (horses weighing 1250, standing 15-2 preferable). Stallions to weigh 300 pounds more than mares, 1400 to 1700 pounds; height 15-2 to 16-2 (preferably weight 1550 and 16 hands high). Stallions must be registered Percherons. Mares' offsprings thus registered will be eligible when mated with registered Percherons of this quality. No ancestry requirements will be made in selecting dams for registration; it is quality that we want. It has been said that with horses very much depends on the dam, far more so than with any other breed of stock, hence we are particular in getting good quality with the dams.

W. B. Carpenter, Kansas City, Mo.

Editorial comment: The above article by Col. Carpenter raises a many sided subject—at least as many sided as we have classes of work for farm horses. On the farm where the tractor has made its appearance there is undoubtedly some change in the work demanded of the horse but is this difference sufficient to demand a different type of horses? Were it not for the fact that the good weighty horse will bring the top price when sold off the farm it is quite probable that a large majority of farmers would prefer the 1250-pound horse with good endurance, style and action. Even as it is now we think a majority of farmers prefer the all-round horse. A few years ago the writer when associated with the State Board of Agriculture obtained the opinion of several hundred farmers on their preference of the heavy draft horse or the 1100 to 1400 horse for farm work and approximately two-thirds of the farmers giving their opinions preferred the lighter horse.

A new suggestion in Col. Carpenter's article is that we develop our light farm horse from the light type of Percheron rather than take one of the coach horses or do as the U. S. Government has done in its effort to establish a breed of American carriage horses. Heretofore we think one of the great difficulties in breeding of the farm horse is that no established breed exactly filled the bill and the further fact that farmers have as a rule had no definite purpose in mind when breeding their mares. This is one of the things that better farm organization could help along for only by community horse breeding clubs can very much be accomplished.

Anyway this opens up a very interesting subject and we would like to hear from our readers as to what they think about it.

WHEN TO SOW REDTOP AND ORCHARD GRASS.

I am writing to ask if this is a good time to sow redtop and orchard grass seed? How much seed to the acre? R., Cedar County.

Redtop and orchard grass may be sown in the fall or spring. Ordinarily when sown in the spring early seeding is best if the land is in good condition and if we should have plenty of rain they may be sown most any time in April or even the first half of May. The reader will understand that the late sowing is at a much greater risk of getting a stand. The seeding of these grasses should be done very much like timothy is seeded.

Neither orchard grass nor redtop make a first class meadow grass but on land not adapted to timothy they will make a fair quality of hay if cut before they are ripe. You will get better results by sowing a mixture than by sowing either one alone. If the land is low or is inclined to be wet we would sow mostly redtop but if upland and dry we would make the heavier seeding of orchard grass.

For full seeding 10 pounds of recleaned seed or 20 to 25 pounds of seed in the chaff will be required of redtop and about 20 pounds of orchard grass. For a good pasture mixture we would recommend 5 pounds recleaned or 10 pounds chaff redtop, 8 or 10 pounds orchard grass, 2 pounds alsike clover and 3 to 5 pounds mammoth clover. A little blue grass added to the above will help if the land is adapted to its growth.

There is no more important subject before practical farmers to-day, than that of seeding and fertilizing grasses either for pasture or hay and we will be very glad to have any of our readers write us about both their successes and failures with any of the grasses. A grass crop that will give a lower net return may in the end be more profitable than a cultivated crop because of the very great loss on rolling lands from soil washing.

Phosphate Fertilizer For Corn

What is your opinion as to the profitableness of broadcasting 150 to 200 pounds acid phospate and disking in before checking the corn?

Gideon Borschlen, Linn County.

This question is discussed more completely than we have space for it here on page 6 of this issue,and every reader contemplating using fertilizers on their corn this spring should turn and read Professor Millers article.

Have balmy spring at home during cold, raw weather!

Early spring chills and colds are inevitable with old-fashioned, drafty, uneven heating methods

The mild, delightful warmth of radiator heating makes every one happy and healthy

Real spring rarely sets in "for good" until it is nearly summer. The cold, damp, chilly days cause a lot of sickness and discomfort in homes which are not properly heated.

AMERICAN RADIATORS & IDEAL BOILERS

An IDEAL Heating outfit will show you its worth more forcibly during changeable, raw weather than at any other time. The IDEAL Boiler is made to give just the volume of heat to keep the house genially warmed and comfortable *all over*, without waste of fuel or everlasting tinkering with the fire. These IDEAL outfits are easily put in old or new farm houses. One charge of fuel lasts 12 hours or more during chilly spring days.

Get the heat that costs the least

Decide now to put in IDEAL-AMERICAN heat. Don't spend another winter without it. Safeguard your family's health. Get the Ideal outfit which will just suit your needs. Running water not necessary. Burn the inexpensive fuels of your locality and make your *house* a real HOME!

A No. 020 IDEAL Boiler and 262 ft. of 38-in. AMERICAN Radiators, costing the owner $185, were used to heat this farm house, at which price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions. The IDEAL outfit is the *only* feature of the house which is never worth *less* than you paid for it.

Don't put it off

Write now—today—for copy of "Ideal Heating." It tells you all about the way to get the heat that costs the least.

IDEAL Boilers do not rust or wear out — no repairs.

Sold by all dealers. No exclusive agents.

THE USE OF FERTILIZERS ON CORN

A reader writes that he wants to increase his yield of corn and would like to buy commercial fertilizers and wants to know how and what to use. The following reply is by Professor M. F. Miller of the Department of Soils, Missouri University:

It is not an easy matter to give absolute directions regarding the fertilization of any crop, since the return secured from fertilizers depends upon the weather and the way the land is handled, as well as upon the soil. Lands which respond with excellent return to fertilizers in seasons of normal or abundant rainfall may give absolutely no return in dry seasons, when moisture and not plant food becomes the limiting factor. The only thing that can be done regarding the use of fertilizers is to recommend those applications which usually bring returns. The Missouri Experiment Station has been conducting for a number of years a series of soil experiment fields throughout the state and have arrived at some rather definite conclusions regarding the fertilization of the more important crops. The statements which follow are based on these experiments.

In the fertilization of corn there are two systems which may be followed. The first is what might be called a temporary system of fertilization. It consists of applying a small amount of fertilizer, preferably a highly phosphatic fertilizer, in the hill or drill at the time the corn is planted, using a fertilizer attachment to the corn planter for this purpose. This plan does not seek to supply any large amount of plant food, but merely to give some readily available material near the roots of the crop in the young stage in order to give it a quick and thrifty start. It has been found also that if large amounts of fertilizer are used in this way and the season turns dry during July and August the corn will almost certainly be fired. In seasons of abundant rainfall, however, as much as 150 or 175 pounds of fertilizer can be used in the hill or drill safely. Normally it is safer to use less than 100 pounds. In our experiments on the northeast Missouri level prairies, of the same character as that on which the correspondent is located, we have found that 50 pounds of bone meal or a 2-8-2 fertilizer have given greater returns than larger amounts. I am sending the correspondent a copy of our bulletin No. 126 which among other things discusses the use of fertilizers for corn and gives the results of these experiments. With reference to the effect of the season upon the return from hill or drill fertilization, I will say that our most strikingly different returns have been secured at Carthage on the level prairies of that region, where in 1910 75 pounds of a 2-8-2 applied in the drill gave a net return of $7.13 while 100 pounds brought $9.41 per acre. In the same season 100 pounds of bone meal brought $4.27 and 125 pounds brought $7.60 per acre. In 1912, a dry year, on the same field 75 pounds of 2-8-2 brought a net return of $4 while 100 pounds brought only $2.70. No bone meal was used in the hill or drill in that particular season.

In general it seems that mixed fertilizers even of rather low or medium grade, such as a 2-10-2 or a 2-8-2, applied in amounts ranging from 50 to 100 pounds give better returns than does bone meal, although probably we have not had enough comparisons to draw very accurate conclusions. The high price of potash this year makes it impossible to get a fertilizer containing as much as 2 per cent, practically all the companies are limiting the amount of potash in the fertilizers to 1 per cent or one-half of 1 per cent. Consequenty a 2-8-1 or a 2-10-1 is about as high as can be recommended in the mixture, which we believe to be more satisfactory in hill or drill fertilization, where only small amounts are used or where a small expenditure of money is desirable. It is possible that later experiments may show that acid phosphate, which is a cheaper form of fertilizer than the others mentioned and which contains somewhat more available phosphates, is a better hill application than mixed fertilizers or bone meal.

The second method of fertilizing corn is that of applying enough fertilizer to materially increase the amount of plant food at the disposal of the crop; in other words this plan is based on feeding the crop a considerable per cent of the plant food it needs by means of the commercial fertilizers. In this case from 200 to 300 pounds of a high grade fertilizer should be applied, putting it on with a fertilizer grain drill ahead of the corn planter. It may be sown broadcast and worked in thoroughly, but this is not a good practice because so much of it remains in the surface inch or two which dries out and in which the roots do not penetrate thoroughly. The important ingredient again in this fertilizer is phosphates. We have found bone meal to give very good returns in this way, but the increased price of bone meal is making this application uneconomical. A good application for this purpose is that of a mixed fertilizer containing two or three per cent nitrogen, about ten per cent available phosphoric acid and around three per cent of potash. This is our opinion from the results of experiments to date. As to the lands on which this can be most economically applied the results show that the thinnest lands are those which give best results with heavy fertilization. On the better lands of the state such fertilization would not pay. On medium fertile land or on lands that have begun to show a need of fertilization but which are not thin, the hill or drill method of fertilization is the most certain to bring paying returns. The heavier fertilization may be used but it will usually be economical only with rather intensive systems of farming including thorough drainage, liming of the soil and a very careful preparation of the seed bed. Naturally there is some variation in the demands of different soils regarding the fertilizer need, but so far as corn fertilization is concerned the statements which have been made as to thin, medium and good lands will apply rather generally over the state.

A caution should be given regarding the use of commercial fertilizers for corn. This is particularly true with reference to the hill or drill fertilization. Too often farmers will try fertilization in this way and find it to pay and they will continue its use, depending very largely upon the fertilizer to bring a remunerative crop. As a matter of fact, the best system of handling land in Missouri, for the man who is not a renter and who has time and means for keeping up his land in fertility, should include a proper crop rotation, together with the systematic use of barnyard manure and green manures, in maintaining the supply of fertilizers merely as an adjunct to this system. Fertilizers are of great value when properly used but they do not keep up land, and they can only be used in connection with soil building and soil maitaining operations, if the land is to remain permanently fertile.

There is too great a tendency among farmers who are just beginning to use fertilizers to depend upon them largely for a crop. Many men expect too much of fertilizers. They seem to feel that they are a sort of universal panacea for all the ills of a worn soil. As a matter of fact, the use of fertilizers is but one of the things to which a man should give attention in handling worn land. The greatest difficulty with all worn soils is a lack of organic matter, and the man who will build up this material in the soil may postpone for some time the use of fertilizers. Where fertilizers are used, however, as a permanent thing, keeping up the supply of organic matter is essential to continued profits. The time is here when farmers can well afford to study carefully systems of green manuring for the purpose of building up organic matter in addition to the careful saving of such barnyard manure as is available. On those farms where much grain is sold and where stable manure is scarce, green manures must find a large place. Under such circumstances a combination of green manuring with the use of fertilizer will bring the greatest total profits.

God Almighty divided men into two great classes—the kind who, when confronted by a difficult problem say "We will" and the other kind who say, "What's the use?" "It can't be done," etc.—and if you belong to the latter class, my friend, the World isn't going to shed any more tears at your funeral than common decency and politeness absolutely demand.

P&O

Volunteer Balance Frame Cultivator

A high grade Walking Cultivator, capable of results that will satisfy the most particular farmer in any section. "It's the Way We Build Them."

A backward crank in the axles shifts the weight of the machine forward sufficiently to overcome any tendency of the tongue to fly up when gangs are raised. Parallel beams. Cone pivots on the beam couplings for taking up wear. Low hitch with perfect equalizer. Adjustable arch gives 34 to 44 inch wheel track. Heavy springs make it easy to raise gangs, and to handle them while at work. Adjustment provided for working close to or away from corn. Easy to set gangs up or down for different depths of shovels. Dust proof wheel boxes with hard oil screw caps. Staggered spokes. Gangs can be tilted to fit side of row when hilling. Handles adjustable to desired position. Very light of draft and adaptable to all soil conditions and to work in corn or cotton.

Can be furnished with any of the standard P & O Gangs, and can be equipped with a Fertilizer Attachment for distributing any of the commercial fertilizers.

Saves a Team
Attachments For Any Binder

4 H. P. Cushman on a Binder Same Engine Does All Other Farm Work

Cushman Binder Engines

For All Farm Work

This is the one successful binder engine. Thousands are in use every harvest. Fits any binder. Engine drives sickle and all machinery. Since horses have only to pull machine, two horses will easily handle 8-ft. binder in heavy grain. In a wet harvest Cushman Engine saves the crop, as it keeps sickle going when bull wheel slips—it never clogs. After harvest Cushman engine does all other work. Very light weight and easy to move around, yet runs more steadily than most heavy engines, because of Throttle Governor and perfect balance. 4 H. P. weighs only 190 lbs.; when stripped for binder only 167 lbs. 8 H. P only 320 lbs. Force water cooling system prevents overheating. Equipped with Friction Clutch Pulley.

Iver A. Madson, Wheatland, N. D., writes: "I have six engines and the Cushman is the best. It does not jump like a heavy engine. On the binder it is a great saver of horse flesh. It will do all you claim and more too." E. W. Gasser, Sidney, Ill., says: "With a Cushman I cut 10 acres more a day with less horses. A binder will last 3 or 4 years longer with this engine." A BOONE COUNTY CLUB AT WORK

Oftentimes when a farmer is approached on the subject of farm organization or neighborhood cooperation he has a kind of far distant look and replies, "Oh, 'taint no use, we've tried it before and it didn't work. Farmers won't stick together and it's just no use to try any more." Just why a farmer who has met with failure after failure with a corn crop on account of drouth or flood or maybe insects is not at all discouraged but will plant again with as much faith as though he had never met with failure and then when he turns his back to the enemy and says its "no use to try because some one has failed trying to do the same thing" when he is asked to protect himself or his neighbor by organization, I cannot for the life of me explain. Yet we know with many of us this is what happens.

A few weeks ago a hard working Boone County farmer getting encouragement from the articles in The Missouri Farmer started out to talk "farm club" to his neighbors but at first met with poor encouragement. At first when a meeting was called at the little school house the leader tried to interest the men in matters about better farming, the Land Bank and similar questions, but these questions which ought to be the very life of every community created little enthusiasm and it looked like a successful farm club was out of the question for that neighborhood. And just there many clubs would have failed before they had even started but not so here because at least one man saw the possibilities of the good a live club could do and so he turned his guns in another direction with grim determination that the club should live and now it is doing things that save them money and everybody wonders why they could not have done it long ago.

Most of the farmers of this district buy their flour from local dealers, 100 pounds or so at a time although there is one of the best flour mills in the state at the county seat only six or seven miles away. Through the club arrangements were made at the mill to buy their flour direct. And this mill like all other mills should do, made the same cash wholesale prices to the members of the club that were made to dealers. And why shouldn't they? Are not millers more interested in the welfare of the men who furnish them their raw material than they are in any one else? Well any way when this arrangement was made with the mill a list of the names of the members were certified to the mill by the secretary of the club and now the members are buying their flour at a saving of 40 cents a hundred pounds. If this saving were applied to all the flour used by Missouri farmers it would mean more than a million dollars saved annually. A million dollars in the hands of a wise committee of farmers would pay the expenses of a good state farm organization for quite a while don't you think? Yet how many farmers in the state are saving this forty cents a hundred? Are you? If not why not?

The members of this club pooled their order for 1200 rods of woven wire fence at a saving of 2 cents a rod, clover and timothy seed were bought at a saving of $1 on the bushel and seed potatoes at a discount of 10 cents a bushel. A clubbing arrangement was made with the local papers and $1.45 was saved to each member on his reading matter.

At the next meeting of the club talks will be made on soybeans and cowpeas and when the amount of seed desired by the members is ascertained they will be bought in club orders at a considerable saving. Considerable wool is produced in this section and the secretary will be furnished with the amount and grade and then the wool will be sold all together. An increased price of 2 cents a pound is not unreasonable to expect by selling the wool by the club and possibly it may be more but an increased price of 2 cents a pound is worth while when it comes without any extra cost.

The above are some of the things a farm club in a community where the farms are small and the people are not wealthy has been able to accomplish and this is only a beginning. There are now forty enthusiastic members and no one is lagging back saying "it's no use — farmers won't stick." The officers of the club are J. J. Fenton, president and D. P. Feely, secretary.

SOME CLOVER TROUBLES

It often occurs that even after good germination we have difficulty in maintaining a stand. The most frequent causes of the death of young clover are the drought and heat to which the plants are subjected upon the removal of the grain crop. The amount of injury caused will, of course, depend on the season. The summer of 1915 was very favorable to young clover, as there was plenty of rain throughout most of the clover belt, but such seasons are exceptional. Injury will also be worse on soils deficient in humus since these run together and dry out more than soils having plenty of organic matter. Top dressing the fields with manure during late winter is as good a preventive of this danger as can be suggested. The manure will not only prevent loss of moisture but will furnish plant food for the young clover making stronger plants, better able to withstand drought. It is also advisable to leave the grain stubble as long as possible to afford shelter to the young plants.

If there is a good stand of clover on a field in September and October there is every reason to expect a good stand in spring, barring, of course, most unusual weather conditions. If, however, the soil is deficient in lime the plant, though appearing fair in the fall, may lack the vigor to go through even a reasonably mild winter. Two mistakes are often made and these should be guarded against. The young clover should not be pastured closely in the fall, nor should it be allowed to seed. Last fall, owing to the favorable summer young clover was found blossoming and seeding in many fields. This is bad because it weakens the plants and increases the number of clover-seed insects, the late broods finding these flower heads a fine place in which to lay eggs which hatch into larvae, many of which may live over winter.

Provided there is lime and phosphorus enough in the land, second-year clover should give little trouble unless attacked by root borers or other insects. There are leaf-eating insects that do damage locally and some fungi have been known to kill whole fields or to reduce yields, but the insects working on the roots probably give more trouble than other insects or than diseases. When a field becomes infested with root-eating insects there is nothing to do but plow it up.

For Greatest Satisfaction Use
DOUBLE SERVICE Automobile Tires
Guaranteed 7,000 Miles Service
Absolutely Punctureproof

Double Service Tires are made double the thickness of the best standard make tires.

This 100% greater wearing surface naturally gives that much more mileage and service. The average of 12 miles of tough fabric and one inch surface tread rubber makes these tires *absolutely punctureproof*.

These tires excel all others for use in the country over rough and rugged roads as well as on hard pavements. They are as easy riding and resilient as any other pneumatic tire—the air space and pressure being the same.

They are the *most economical* and "care free" tires made and are used where tires must be depended on and tire troubles cannot be tolerated. Many *Double Service* style tires are in use in the U. S. government and European War service.

Our output is limited to a certain amount, but for a short time we offer the following reduced special prices as an **Introductory Offer:**

Why Clutter Your House With Pipes and Flues?

(Copyright 1915 by The Monitor Stove & Range Co.)

Make your house comfortable. Many farm home owners are deterred from installing a furnace through unwillingness to mutilate the house in order to put in pipes. This trouble and expense are now unnecessary because we offer you

A Patented One Register Furnace

Our wonderful invention makes this possible. You cut just one hole for a register immediately above our furnace and the warm air circulates through the house. No pipes or flues. Your house is cozy from top to bottom. Can be installed in any house, new or old, almost as easily as a stove. By digging a pit you can even put it in a house that has no cellar. The

Easy To Install — PIPELESS CALORIC FURNACE (TRADE MARK) — **Saves You Money**

is guaranteed to use 35% less fuel. Special ribbed firepot gives 600 square inches greater heat radiation than the average firepot. There are no pipes running through the house and cellar to waste heat. The ribbing provides a free air circulation which permits thorough burning of coal without wasteful clinkers. No ashes clinging to firepot to retard circulation.

The Caloric Pipeless Furnace burns coal, coke or wood equally well. It does away with the disagreeable task of carrying fuel upstairs and ashes down stairs. It keeps the upstairs rooms and halls uniformly heated at all times.

It is safe for children because there are no hot registers in upstairs rooms to burn them. This is the one furnace that will not spoil your produce in the basement.

Takes less cellar room than an ordinary furnace and saves stove room through the house.

Our Liberal Guarantee

Put this furnace in your home and give it a thorough try-out. If it is not perfectly satisfactory we'll make it so any time within one year from date of purchase. You can't go wrong when you fit your house with the Caloric Pipeless Furnace because we absolutely guarantee it.

Ask Your Dealer or Write For Catalog

If there is a Caloric dealer in your town he will gladly give you a copy of this book and show you the furnace. If there is no dealer write us direct.

Do You Need a New Cultivator?

International Cultivators

YOU will put your OK on the **International cultivator** when you have had one at work for a while. When you are used to the parallel movement of the gangs, and see what a thorough job the machine does, you would not be satisfied with any other.

In two important points the **International cultivator** is practically perfect. The depth of cultivation is the same, all over the field, over ridges or back furrows or in depressions, with no unturned spaces. Ask your dealer to show you why.

If your work demands a walking or combination walking and riding cultivator, take an **International No. 2 or 3.** If much of your cultivating is on hillsides, **buy a No. 4.** For straight-away work there is the **No. 1 one-row and a new No. 5 two-row** machine that speeds up good cultivating to the limit.

A local dealer near you can show you **International cultivators** in every style, and help you decide on the best style for your fields. You can get numerous combinations of shovels and settings on an **International** cultivator. Do not buy a cultivator almost as good when you can get the International. If you prefer to know more about the cultivator before going to see it, write us for information.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VIII April 1, 1916 No. 7

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the potoffice at Columbia, Missouri, as second-class mail matter.

WHY NOT CHANGE OUR TAXING SYSTEM?

We are so closely wedded to custom and precedent in this country that it is hard to get away from any practice long established however much we may criticise that practice. No one will defend our present taxing system and yet it seems impossible to change it. One reason for this is because some schemes are proposed that are so radical that the average, or conservative citizen makes up his mind that we had better hold on to what we have rather than try to make any change at all.

Quite a number of years ago a rich Irish landlord saw an opportunity to greatly increase his wealth by investing in American land and so he bought several thousand acres of rich Illinois' prairie. He leased these lands to American farmers and used the annual profits he received from the rentals for the purchase of more land. He did not spend any money for improvements for under his system of leasing the tenant must provide for whatever improvements he wanted. Out of the profits of his first investment he has purchased large holdings in Nebraska, Kansas and Missouri, and in the mean time these lands have doubled and quadrupled in value. What did the Irishman do to earn all this wealth? Nothing at all for he was not a citizen of the country until these states passed alien land laws which compelled him to move to New York and become a citizen of the United States. This instance of unearned wealth is typical of a condition that has furnished the principal argument for the single tax. We hardly believe that any one would attempt to defend a system that permits land to be monopolized in this way.

The single tax advocate would try to reach such cases as the above by raising all taxes on land values but they would release from any responsibility to the Government, State or Municipality all other industries no matter how renumerative they might be. In order to catch a few men who have become wealthy on the unearned increment of land they are willing to place an extra burden on every home owner in the country. For a time this plan might work, so long as the country is progressing from a new or undeveloped condition but when it reached a static position in land values the burden of keeping up the Government from top to bottom would fall upon land owners alone whether great or small, whether home owner or speculator. And this alone is sufficient reason for oppossing the single tax theory of raising revenue.

Most all countries levy certain license or privilege taxes as well as tariff duties but the principle underlying these is regulation and not revenue although we do now use this form of taxation to raise large sums of revenue for the state and nation.

Land and its improvements can not be hidden and hence is about the easiest thing we have to tax and the hardest to evade. And very naturally land has always borne the heavy burden of taxation. Of our direct taxes in Missouri we now get 79.2 per cent from land and improvements if we include railroads with the land. It is a generally conceded fact that millions of intangible property subject to taxation under present laws escape taxation and no state has found a way to get hold of this hidden property.

To get our readers to thinking about the subject we are going to suggest what we think would be a fair and just system of taxation that would put the burden more evenly according to the ability of men to pay it and would place all on the same level. It will correct the evils the single taxer complains of without imposing the unjust features of that system.

Our plan would be to adopt in lieu of all property taxes now collected the income and the inheritance tax. The United States Government has already proved the practicability of the income tax and a number of states are collecting taxes on inheritances. By exempting very small incomes and placing the tax on all incomes above that exemption the average man and the wealthy would share the burden in proportion to their ability to pay it.

THE LAND BANK AND SINGLE TAX

Special interests and demagogic politicians who have not been able to find any good argument against the proposed Missouri Land Bank are resorting to the old political methods of the tricksters and are trying to confuse the minds of voters by crying out, beware of the Land Bank as the first step to the Single Tax. A correspondent from Bates County writes that his neighborhood has been circurlarized against the Land Bank and that some of the local newspapers have published veiled threats against the measure purporting to come from some farmers' organization. The claim is also made that other farm organizations are soon to adopt resolutions condeming the Missouri Land Bank. Our correspondent need not be worried about such underhanded attacks although he says he has reason to believe that a big trust company which does a very large business in farm loans is really back of the attack.

The strongest as well as the most conservative of farm organizations in this country is the National Grange and at their National meeting held in San Francisco last summer that great organization of farmers endorsed the principles of the Missouri Land Bank. In this state the president of the Missouri State Grange, Hon. C. O. Raine, is one of the ablest advocates of the Land Bank. Mr. Raine is a farmer and has always stood for their interests and would be the last man to defend any measure akin to the Single Tax idea of Henry George.

The false statement is made that the Gardner Land Bank exempts all farm mortgages from taxation and is therefore a single tax measure. In reply let us say the only exemption under this Act is the assets of the Land Bank which include the debenture bonds issued by the Land Bank. The Constitutional Amendment which is to be voted on next November makes no provision whatever for the exemption of all farm mortgages as every one who has read the amendment knows. This is the exact language of that section of the amenddment: "Section 3. The General Assembly is hereby authorized and empowered to enact a law exempting from state, county and municipal taxes the assets of said Missouri State Land Bank and debenture bonds issued by it." It will be readily seen by those who want to get at the facts that while this amendment gives the General Assembly power to exempt these bonds issued by the Land Bank the alternative is also true that the bonds may be taxed by the General Assembly, should the majority think it wise to do so. And as the General Assembly is supposed to reflect public sentiment we see no danger whatever in this proposition.

Looking at the practical side of what will be the result if the Legislature should exempt the debenture bonds at the Land Bank from taxes we have only to turn to the last auditors report to see about what difference it would make. The latest report of the state auditor made public is for the taxes of 1914 but relatively the figures will vary little for the present year. The total taxable wealth of Missouri for that year was $1,818, 992, 249. Approximately 70 per cent of this total was levied on real estate including the improvements. The cities paid on real estate about 62 cents for every 38 cents paid on farm lands. The railroads, telegraph and telephone property paid taxes on approximately $195,000,000. Corporate companies and banks on approximately $84,000,000 Live stock about $5,700,000; Money, notes and bonds $116,679,706. An analysis of these figures show that all the money, notes and bonds that the assessors of the state are able to find amount to only about 6½ per cent of the total taxable wealth. A bank statement would show several times as much money on hand the first of every month in the year as the amount the assessors find under the three heads, money, notes and bonds. There are millions of dollars represented in notes both secured and unsecured by mortgage and millions of dollars in bonds but the assessors taking a list of property under oath find only $116,679,706 or about 6½ per cent of the total taxable property. In practice then if we should exempt all farm mortgages it would not make a difference of more than one or two per cent of the total while the exemptions under the Land Bank Bill would only be a fraction of one per cent. The notes and mortgages held by the people of other states and the farm mortgages they represent are a large part of the whole and as a matter of courses these can not be reached by our assessors.

The writer believes that every dollar of property as nearly as possible should pay its rightful share of taxes but we do not think it right to tax any class of property twice but that is exactly what we do when we tax farm mortgages. The man who owns a farm worth $10,000 and is owing $5,000 on it is in fact the owner of only his equity or one-half the farm but the assessor makes no difference and lists him for the full amount. Then if we tax the mortgage which represents the other half we have the farm taxed for $15,000 or 50 per cent more than it is worth.

The important thing for voters to do is to get rid of both their prejudices and the political demagogue. If we were to exempt all notes, bonds and mortgages from taxation but require them to pay a small registration tax which would exempt them during the time they run we would get a great deal more revenue from this class of property than we do now and certainly it is the number of dollars paid into the public treasury that count.

GOOD WORK BY THE GOVERMENT

The Federal Department of Agriculture announces that the long fight against foot-and-mouth disease is over and that on March 31 all quarantines and restrictions were removed. The last quarantine was in Illinois but that territory is now all cleaned up.

The losses from foot-and-mouth disease during this last outbreak has been many millions of dollars sustained by the U. S. Government, the various states and the live stock owners. Farmers who had stock killed by order of official veterinarians were reimbursed in part at least for their loss but the live stock interests all over the country suffered heavy losses because of restrictions in moving the stock. The disease was found in 22 states and in 269 different counties. The following statement is made by the Department of Agriculture:

"As a result of better understanding between the State and National Governments, representatives of the Department believe that many of the obstacles which confronted the authorities in the past outbreak would not be encountered in dealing with any future occurrence of the disease. The veterinarians, however, will not abate their watchfulness for some time. Examination of animals and animal products offered for import will continue to be unusually strict. The Department, moreover, particularly urges all farmers and cattle handlers to notify their State veterinarians and the Department of any suspicious cases of sore mouth combined with lameness in their animals. Those in charge of the eradication work are confident that the disease is wiped out, but they wish to use every precaution to detect and control any sporadic cases that may develop in remote districts."

"The importance to the stock raising industry of eradicating foot-and-mouth disease may be judged from the results of this plague in Denmark, where the disease appeared at about the same time that it broke out in the United States. The area of Denmark is ap-

WE THANK OUR FRIENDS

While the response to our recent appeal was not in the aggregate what we had hoped for, yet we take this opportunity to thank our many friends for what they so unselfishly did and this is merely to say that the men who carry the burden of the great fight which The Missouri Farmer is waging for a "square deal" for the farmers of this state will never lay that burden down until sheer necessity compels them to do so.

That, in the meantime, the sun is shining just a little way ahead and that the time is not far distant when the farmers of Missouri will awake to the true significance of the great movement which this paper has inaugurated is my ardent hope. With their heartfelt sympathy and help nothing is impossible. Without that we cannot hope to win.

William Hirth, Publisher.

proximately equal to that of the three NewEngland States— Massachusetts, Connecticut and Rhode Island. It is, however, a great dairying country, and it has been estimated that the losses in milk in one year caused by the foot-and-mouth disease have amounted to approximately one-third of the total cost of eradicating the pestilence in 22 states of this country. The Danish authorities were unable to carry out their former policy of slaughter, and were compelled to resort to such measures of control as could be established by quarantines and other restrictions.

BARNYARD GOSSIP

Have you ever met up with the fellow who was just "dead certain" that he knew it all about some things and a lot about most everything? Well I met him the other day and he told me how to grow oats, big oats, oats 100 bushels to the acre, and more. "Why," he said, "I don't see why farmers fool away their time plowing the land for oats. Then the practice of seeding oats with a grain drill is expensive and is unnecessary to grow a good crop. You know," he continued, "I have raised more than 100 bushels per acre and all I did was to sow the seed down on corn land and plow them under then smooth the ground over with a harrow. When that is done there is nothing more to do until harvest when you are sure of a good crop. No sir, I have never failed to raise oats when I plowed them under—put the seed down where it could get hold of moisture, and I can not understand why the slip-shod farmers of Missouri lose time plowing and disking and harrowing and drilling when they can raise better oats by my method of plowing them under." Now this was an intelligent looking man so I thought I had discovered a big million dollar story for our readers because the man spoke as one speaking with authority—as one who knew what he was talking about and just could not possibly be mistaken.

I asked him where he had farmed and he told me it was in Iowa. Then I ask him if he did not know that the average yield of oats in Iowa was less than one-third of a hundred bushels per acre and that the highest average yield in ten years was less than 38 bushels per acre? I said:, I thought the man who could show the farmers of Iowa or Missouri an easy way to grow an average of 100 bushels of oats an acre ought not bury his talent by living in town on the interest of money made largely by the increased value of land he was fortunate enough to buy very low and sell very high.

The story I learned from this retired farmer, who was dead certain Missouri farmer's did not know how to grow 100 bushels to the acre as an average, was about this: He was the son of a prosperous Ohio farmer and in 1870 when the son reached his majority his father bought for him a quarter section of rich, unimproved prairie in Southern Iowa. Starting with this land made rich by the forces of Nature this young man made money enough to improve his farm and to buy an adjoining quarter section. Some three years ago he sold this land for $40,000,—$125 an acre— and came down into Central Missouri to retire and live in one of our good towns. Now, this man who is typical of thousands of others who located in Illinois, Iowa, Missouri, Nebraska and Kansas, 40 to 60 years ago is sure that his wealth came from good farming and from his own industry. But is that altogether true? Is it not a fact that about three-fourths the value of his present bank account came to him as a gift—without any effort on his part—just came to him as a wind fall but no argument you could offer would convince him that every dollar he has is not the fruit of his own industry and superior intelligence.

I merely mention this incident because this man represents a class of men in this country who do not realize the changed conditions a half century has brought about in agriculture. These men because of their age and property interests exert a powerful influence but I fear that fifty years hence those living then will see that this influence was thrown against progress and improvement. It was not the slip-shod way of sowing oats that produced 100 bushels an acre, but it was the fine physical condition and the great store of virgin fertility. The fellow who is farming the well-worn soil of to-day knows that even the best methods of cultivation that fifty years of experience have shown to be necessary will not produce 100 bushels of oats on an acre of depleted soil.

The young men to-day are facing another difficulty not known to those of a half century ago Then with $1500 to $2000 he could get a choice quarter section of the best prairie, today the same land not counting improvements will cost four to five times as much. I believe the farmers of today, that is the progressive class at least—are doing the very best that can be done under present conditions. These old fellows who were favored, not of choice nor of intelligence, but by accident in time of their birth, with cheap lands and rich lands, should stop, think and understand that it costs more labor now to cultivate an acre of average land than it did when they were farming; that the land itself costs a great deal more; that it costs a lot in both time and money to restore the fertility that they have taken from the soil; that under these conditions the yield of crops is proportionately less.

One thing we can do and these well-fixed and retired farmers can help us do to balance up present conditions with the men who are trying to get a living out of land their forefathers wore out and that is to lend our aid for a system of rural credits that will give farmers more capital at a lower rate of interest. This is only one thing that is needed but it is a very important one.

By Old Jim Riley

When "Teddy" says he wouldn't refuse another nomination for President, what he really meant is that he would like to kick the daylight out of anybody that ain't in favor of him havin it.

BUCKSHOT BY THE PROFESSOR

I think the average hog has a kick coming on being butchered and cut up by as big hogs as the Packers are.

There are a pile of hens in Missouri who make more real money than the "hound dog" fellows who own them.

Watch that seed corn and be sure that its sound. It takes a full crop to land a full stand.

They'r at it again all over the state—raking the corn stalks into wind rows and then burning them. While some farmers are trying to build up fertility others are deliberately destroying it.

When I see a big tobacco or patent medicine sign painted on the outside of a farmer's barn I never expect to find any high class live stock on the inside. Furthermore, you can bet that his self-binder and other farm implements are standing just where he used them last.

Suppose you fix the garden this time just like your wife wants it? There is no patch of ground on the farm that pays bigger dividends—and your wife ought not to have to break her back tending it.

Why didn't somebody think to give "Teddy" the job to catch Villa? When a man's just literally spoiling to fight all the time its downright inhuman not to give him a chance.

There are a pile of farmer wives who ought not to be afraid of Hades—for the average farm kitchen has the lower regions skinned a mile when it comes to warmth.

The Packers are not the only fellows who deal in Pork. The average Congressman or Senator for instance loves it.

I am not exactly for a big army or navy—and yet I want ours to be big enough so nobody can pull Uncle Sam's whiskers as if he was a billy goat.

It's none of my business if a fellow won't curry his hair or his whiskers but that's no reason why he shouldn't curry his horses.

I see where Willard got $50,000 for licking Moran. Moran got the licking and $25,000. At that rate, I'd be willing to get licked at least once.

I noticed the other day where a bunch of German soldiers chased a bunch of English soldiers. Then they ran into a bunch of Irish who had taken refuge in an old tumble down building—and when the brick bats began to fly the Germans took to their heels. No use trying to ever invent a gun that will lick an Irishman as long as the brick bats last.

POSSUM HOLLER DOINS

The bunch gathered at "Hez" Brown's store the other afternoon and found old "Hez" in an ugly humor. "I don't mind you fellers congregatin around here and spittin on the stove but I ain't gona stand fer this eatin my dried appels no more. Why it would break up John D. Rockyfeller keepin you fellers in dried apples." Thus quoth old "Hez." "Well," said "Hump" Lewis, "I am gettin kinda sore on em myself, so you might trot out some dried raisins for a change." "Hez," said old "Chouce" Baker, "don't you know you ain't never goin to git to heaven? You know everybody that goes to heaven has got to be a angel—and you'd make just about the same kind of a angel as my old blind mule. Why the average old gorilla has got you skined a mile when it comes to havin a sweet disposition. Now give me a quarters wuth o' Horseshoe and shut up"—and as old "Hez" clinked the quarter on the cover of the old spice box to see whether it was counterfeit or not, he soon forgot his dried apple wrath and the conversation turned into other directions. Old "Chouce" bit off a big hunk of Horseshoe and then said: "Well, I see where a dozen of our soldiers got smashed up in a railroad wreck down in Mexico tother day—an if they keep on at that rate they'll all be crippled up before they git to Villa. Then I see where one of our airship fellers got lost and another got all bunged up." "How'd he git bunged up? Did Villa shoot him?" asked "Hump" Lewis. "Naw, he run into the side of a mountain with his contraption" responded "Chouce" disgustedly. "And then the wireless business won't work. I reckon a feller could have jist about as much luck telegraffin on a clothesline"—"Well, if the army don't suit you" roared "Jep" Thompson who had stood it as long as he could, "why in thunder don't you git up one of your own? There are a pile of people in this country that are runnin down the army and criticisin th' government that can't pay their grocery bills." "Well if I wus to make up an army" replied "Chouce," "it would do some shootin. It wouldn't git all crippled up in a railroad wreck." "Naw you wouldn't" said "Jep". The only shootin you'd do would be with your mouth—just like a lot of other fellers. If you wus to meet up with Villa he'd just laff—and you'd spoil a lot of cactus plants and sage brush gitten away." At this junction "Josh" Simpson dropped in to buy some fish hooks and the whole bunch wanted to know how they were "bitin."

10,000 NEW 1916 GALLOWAY SANITARY CREAM SEPARATORS

SPECIAL PROPOSITION from NOW till GRASS--in addition to my new low prices. My way of opening new territory, as one separator sold in a neighborhood always sells from one to twenty-five more. EVERY GALLOWAY SEPARATOR is equal to if not better than other separators selling for $75 to $95. Users say "way ahead of others." I only ask one thing--before you buy a separator of any make, kind or any price, get my big book; pick out the separator you want, try it 90 days, 180 times, at my expense. If you decide to keep it (you don't have to) I'll give you the choice of 5 open, fair and square selling plans and guarantee my separator for 10 years against defective workmanship and material and a $25,000 bank bond backs every sale. You take no chances.

4 Good Sizes

EXPERIENCE A COSTLY TEACHER

S. M. Jordan.

A lot of us do not always profit even by our own experience. Many of us refuse to take the word of the other fellow unless the other fellow's notions coincide with our own. You know we usually think a fellow smart in so far as his ideas agree with ours. The world has made more progress in the last fifty years than it made in any other five hundred years that I have heard about. This may be due in part to the fact that we are getting to the point of civilization that most any one now can understand that one man in one lifetime cannot know very much in proportion to the amount of knowledge that the "ould world" contains. When we get this far along we are able to think that it may be the other fellow who is right and that, strange as it may seem, we ourselves may be wrong. Just in proportion as we can see this will the world make big headway.

The following letters show what might have been saved had this man been willing to listen to the other fellow, or had taken the time to investigate. At practically every farmers' institute where I have lectured for many years this very subject has been discussed very fully, as I have always considered it the very first in importance. On this matter of soil betterment there is no longer any room for doubt, and there are at this time vast numbers who are reaping the rewards of correct soil building methods, but there are as yet all too few.

This man lost three or four years of the best part possibly of his life finding out the simple plans of soil building that he now, and rightly too, so strongly endorses.

I find in so many instances men who refuse to listen to a farm talk, and who seem to think that it would reflect on their intelligence if they should be found at a farmers meeting. It also often happens that such a person is the one most sorely in need of more information. It would seem that the man with a poor soil should be the first to seek all the information that is possible for him to secure.

Through this man's letters his experience brought him correct conclusions, and they are just the same as we have been preaching for years and are just as many others have worked them out. In one short hour all the plans that he has found out through his experience could have been outlined to him, in such a clear way that he would have easily understood, and thus saved him perhaps three "bitter years."

I would by no means say that this man lost three years, for his letter alone will be a help to some one else, and his winning in the end may lend hope to some who may be discouraged. And lastly it is just one more testimonial to the already long list that correct methods will win whether we learn them through hard experience or whether we learn them from the other fellow.

When we come to count up, I guess we have learned most that we know from the other fellow any way.

It has been my observation that those who have given the legumes that are mentioned in the letters an intelligent trial have never given up their use. This is especially true with the soybean. It is also true that cowpeas will make some growth on soil too poor for soys to grow. This fact has been known by most of us so long that it scarcely seems that it should be again repeated. Usually those who have been growing soybeans have almost abandoned the cowpeas except for pasture or green manure.

Letter Number One

Richards, Mo., March 2, 1916.

Sam M. Jordan,
Columbia, Missouri.

Dear Sir:

I read your article in the Year Book of 1915 which is a good one. But my experience has been when soil is very bad soybeans will not grow, while cow peas will always make some growth. In this respect they (the cowpeas) are better, and the stems of the cowpeas are much softer and easier to eat than the soybeans and for that reason cows eat them better.

Before buying my farm it had been rented 23 years and when I took it seven years ago it was so poor it would not grow either corn, oats, wheat or grass of any kind. Last year I raised better than 40 bushels of corn per acre and 4 tons of alfalfa per acre.

Cowpeas did the business. My record for a 13-acre field is as follows:

1909 8 bushels per acre (corn).
1910 7 bushels per acre (corn).
1911 3 wagon loads of oats (bundles) on the 13 acres.
1912 48 bushels wheat on the 13 acres.
1913 cowpeas (pastured).
1914 cowpeas, 24 loads hay (big ones) Very dry season.
1915 40 bushels corn per acre.

And on account of the wet weather I was able to cultivate only twice.

When land gets as poor as this farm was your soybeans will not grow, at least I could not make them grow. My land will now grow them and I think the nodules much larger and grow more of them than cowpeas.

It took me 4 years to find out the above, and I lost the 4 years. It may save someone else to know this. I have paid as high as $3.05 per bushel, but it paid me to do it. I sow with a grain drill. One bushel and a peck.

K. F. U.

My Reply

Richards, Missouri.

Dear Sir:—

I have received your very interesting letter of the 16th ultimo and desire to say that your conclusion relative to cowpeas doing much better on poor land than soybeans will do is entirely correct. I am glad to note the success that you have made in building up a piece of worn out land, as it is just one more piece of evidence supporting me in my contention that correct methods will build up worn out land both quickly and cheaply. I assume that you would have no objections to my using at least a part of your letter in a newspaper article, since I believe there is some high class information in it.

Yours truly,
S. M. Jordan.

March 4, 1916.

Letter Number Two

Richards, Mo., March 6, 1916.

Mr. S. M. Jordan,
Columbia, Missouri.

Dear Sir:

I did not write my letter with the idea of having any part of it published but if it will do any one any good you may do so. I wrote the letter believing you did not go far enough in your article. I feel that the hay, while very good, is only about one-half the profit. In fact, one can hardly figure out the good to the soil in dollars. **My reason for feeling so strong on this point is if I had known about it I would have saved three years.**

In another two fields I have been trying to get alfalfa. In one I used manure and tile and I have been trying for seven years and have failed. In the other I used cowpeas and wherever the peas grew rank and of a good color I put in the alfalfa. This field is now well set and did it in three years. Last year I cut it four times. The first field mentioned has been a big expense while the last has shown a profit.

I have had even worse experience than the article in the 1915 Book on clover, for I have failed each time. But this year I am going to put the field I gave you a record of back into peas and follow up with clover and I feel sure I will succeed. K. F. U.

FERTILIZERS AND LIME NEEDED FOR GROWING CLOVER

It is a great mistake for farmers to allow the annual acreage of legume crops to run down because without the use of these crops it is rather a difficult proposition to keep up the fertility of the farm. Sometimes we hear a man say that when his land is too poor to grow grain he can grow clover on it but that is a mistaken notion. When land is too poor to grow a good crop of corn it will not grow a big crop of clover. Clover may grow on some poor land but it will not make a profitable crop. In discussing the use of lime and commercial fertilizers in clover growing the U. S. Department of Agriculture says it is not easy to tell when a soil has enough lime.

There are several methods for testing the "lime requirement" of soils; but for practical purposes, this may be roughly determined by the kind of plants growing on the land. If trouble has been experienced with red clover but if a fair growth of timothy and of alsike clover can be gotten, the land probably needs some lime, say 1,000 pounds of ground limestone per acre; if timothy and alsike clover are crowded out by redtop or if such weeds as sorrel are abundant the land needs plenty of lime, at least a ton of ground limestone to the acre, and probably more. While the functions of lime both in the soil and in the plant are not thoroughly understood, we can confidently say that the clover plant is healthier when there is plenty of lime than when the soil is sour, and being healthier the young plants will withstand a dry spell better, and the old plants will come through the winter better than plants growing on sour soil. To sow red clover seed on so-called acid soils is usually to waste time and money.

The addition of phosphates has also been found to be very beneficial, but here again there is no way to tell how much is needed without trying. If clover has not done well on a farm, the need of lime or phosphorus or perhaps both is indicated and the farmer would do well to buy a bag or two of ground bone or of superphosphate and a ton of fine ground limestone and apply separately or in combination to a part of the field. The growth of the clover during the following season will tell the story of the needs of his soil. The bone meal and phosphate may be ap-

Cave Life or Civilization

Civilized man is distinguished from the cave man by his habit of co-operation.

The cave man lived for and by himself; independent of others, but always in danger from natural laws.

To the extent that we assist one another, dividing up the tasks, we increase our capacity for production, and attain the advantages of civilization.

We may sometimes disregard our dependence on others. But suppose the farmer, for example, undertook to live strictly by his own efforts. He might eke out an existence, but it would not be a civilized existence nor would it satisfy him.

He needs better food and clothes and shelter and implements than he could provide unassisted. He requires a market for his surplus products, and the means of transportation and exchange.

He should not forget who makes his clothes, his shoes, his tools, his vehicles and his tableware, or who mines his metals, or who provides his pepper and salt, his books and papers, or who furnishes the ready means of transportation and exchange whereby his myriad wants are supplied.

Neither should he forget that the more he assists others the more they can assist him.

Take the telephone specialists of the Bell System: the more efficient they are, the more effectively the farmer and every other human factor of civilization can provide for their own needs and comforts.

Or take our government, entrusted with the task of regulating, controlling and protecting a hundred million people. It is to the advantage of everyone that the government shall be so efficient in its special task that all of us may perform our duties under the most favorable conditions. Interdependence means civilized existence.

plied at the rate of 200 or 300 pounds per acre. Of course if there is time and opportunity it will be well worth while to try different rates of application so as to find what rate will give best returns at smallest expense. On sandy clover plant then, lime, phosphorus and potash must be present; the presence of nitrogen is of minor importance, though, of course, the young plants will do better if nitrates are available. If clover has not been on the land for many years it will be wise to scatter dirt from a clover field or to inoculate the seed with the nitrogen germ. When this is present the clover plant can draw on the nitrogen of the air.

The principles of seccessful clover growing may be summarized as follows:

Give the clover a chance to make a healthy plant by adding lime, phosphorus and potash to soils that need them. In some way add vegetable matter to the soil and keep up the supply by turning under clover often enough.

Give the seed a fair chance by placing it in mellow soil and covering it from one-half to one inch deep.

If sown with a nurse crop, give the young plants a chance by not seeding the grain crop too thickly, by top dressing with manure if practicable, and by cutting the stubble as high as possible.

For further information the reader is referred to Farmers' Bulletin No. 455.

SELECTION OF BREEDING FOWLS

The secret of successful poultry raising is to cull. Breeding stock should undergo a most rigid selection not only for type but for constitutional vigor for unless a bird has a good, strong constitution it cannot be an economical producer. Weak chicks are more liable to disease; they are not as good egg producers, nor do the birds grow and fatten as economically.

A good constitution is indicated by a broad, deep chest, long body, active disposition, keen bright eye, a broad head and bright colored comb, glossy plumage and a very well-curved beak. Birds which have any tendency toward the elongated heads, commonly known as "crow heads" should be eliminated from the breeding pens. Females that have heavy abdomens and excessive fat so that they bag down behind should be sent to the market for they are generally poor breeders and always poor producers. The bird which is the first off the roost in the morning and the last to go on to the roost at night should be used.

Any bird which has been sick at any time should not be used in the breeding pen. The time to begin to select breeders for the next season is when the chicks are hatched. Those birds which show a tendency towards weakness should be marked at the time that this weakness is noticed in order that they may never find their way into the breeding pens. A system of marking the birds should be used to enable the owner to tell the age of his chickens. This can be done by toe-marking the chicks with a punch when hatched; or the mature birds may be leg-banded in the fall. The fowls for the breeding pen should be selected from the one and two-year-old stock in order to secure the largest and best eggs for hatching. In fact the experience of the Missouri Agricultural Experiment Station shows that in economical egg-production few hens over two years old should ever be retained.

The breeding stock should be separated from the general flock. It is an unnecessary expense to breed from the entire flock because some of the birds do not come up to the keepers' ideal of chickens, and for that reason should not be used. The worst fault of the usual method of breeding are (1) the use of inferior males; (2) the breeding of immature or poorly developed stock; (3) the breeding from the entire flock, poor as well as good; and (4) the selection of eggs from the general egg basket. The farmer should aim to select a few of the best females and then mate to them a good, vigorous male. A few hens properly handled will produce all of the eggs necessary for hatching purposes, will eliminate the need of using additional males and will produce much better progeny. H. L. Kempster,
Missouri College of Agriculture.

THE WATER-GLASS METHOD

For the benefit of other readers who may not know about the water-glass method we will give it again. There is no good reason why farmers should not preserve enough eggs when they are cheap and plentiful to supply their own use during times of scarcity.

A dry, dark, cool cellar where the temperature never gets above 60 degrees is the best place to keep the eggs. The eggs must be gathered daily, using only clean eggs and put those gathered each day right into the solution.

The best or at least the most economical vessels to use are clean stone jars of any size convenient but of course when only a few eggs are to be preserved the glass fruit jars as described in the above letter are very convenient and satisfactory. To make the preserving solution buy the water-glass from the drug store. Take water that has been boiled a few minutes and let it cool, then use one part of water-glass to nine parts of water and fill the jar about one-half full. Put the eggs in daily as gathered and fill so the fluid will cover the top eggs an inch or more. Then place a tight cover to prevent evaporation. A good piece of wrapping or paraffin paper with a board over it should make a satisfactory cover. The jars should be scalded out well before using to make them sterile.

Use Incubator Eggs at Home

The eggs removed from an incubator because they are infertile, while not fit after such heating for keeping, and not good for boiling or poaching, may, if used at once, be fried, and are good for cake and certain other baked foods. Such infertile eggs, moreover, make one of the best feeds for early chicks and many poultrymen use all their infertile eggs from incubators for this purpose. The farmer, therefore, would be wise to use such eggs immediately at home and not to mix them with his spring eggs. He should send only fresh eggs to market and should try to sell to the country collector, or store, on a strict quality basis. Incubator eggs when they reach market are classified as "Low Grade No. 2," and the presence of any number of them in a case reacts unfavorably on the grading of the entire 30 dozen at the hands of the first wholesaler.

To Rid Flock and House Of Lice

Grease baby chicks on top of heads.

Dust all sitting hens at least three times during hatching period.

Use blue ointment or other grease on all other hens.

Provide a good dust wallow.

Of Mites

Remove all litter in which the pests could hide.

Spray the house thoroughly.

Fumigate if the house can be made air tight.

Paint the roosts and nests with a good wood preservative.

Three Hundred Million Bushel Crop in 1915

Farmers pay for their land with one year's crop and prosperity was never so great.

Regarding Western Canada as a grain producer, a prominent business man says: "Canada's position today is sounder than ever. There is more wheat, more oats, more grain for feed, 20% more cattle than last year and more hogs. The war market in Europe needs our surplus. As for the wheat crop, it is marvelous and a monument of strength for business confidence to build upon, exceeding the most optimistic predictions."

Wheat averaged in 1915 over 25 bushels per acre
Oats averaged in 1915 over 45 bushels per acre
Barley averaged in 1915 over 40 bushels per acre

Prices are high, markets convenient, excellent land low in price either improved or otherwise, ranging from $12 to $30 per acre. Free homestead lands are plentiful and not far from railway lines and convenient to good schools and churches. The climate is healthful.

There is no war tax on land, nor is there any conscription. For complete information as to best locations for settlement, reduced railroad rates and descriptive illustrated pamphlet, address

David Dunne

A Romance of the Middle West

By BELLE KANARIS MANIATES

CHAPTER I

Across lots to the Brumble farm came the Dusty apparition of a boy, a tousle-headed, freckle-faced, gaunt-eyed little fellow, clad in a sort of combination suit fashioned from a pair of overalls and a woman's shirt-waist. In scarch of "M'iss M'ri," he looked into the kitchen, the henhouse, the dairy, and the flower garden. Not finding her in any of these accustomed places, he stood still in perplexity.

"Miss M'ri" rang out his youthful, vibrant treble.

There was a note of promise in the pleasant voice that came back in subterranean response.

"Here, David, in the cellar."

The lad set down the tin pail he was carrying and eagerly sped to the cellar. His fondest hopes were realized. M'ri Brumble, thirty odd years of age, blue of eye, slightly gray of hair, and sweet of heart, was lifting the cover from the ice-cream freezer.

"Well, David Dunne, you came in the nick of time," she said, looking up with kindly eyes. "It's just frozen. I'll dish you up some now, if you will run up to the pantry and fetch two saucers—biggest you can find."

Fleetly David footed the stairs and returned with two soup plates.

"These were the handiest," he explained apologetically as he handed them to her.

"Just the thing," promptly reassured M'ri, transferring a heaping ladle of yellow cream to one of the plates. "Easy to eat out of, too."

"My, but you are giving me a whole lot," he said, watching her approvingly and encouragingly. "I hope you ain't robbing yourself."

"Oh, no; I always make plenty," she replied, dishing a smaller portion for herself. "Here's enough for our dinner and some for you to carry home to your mother."

"I haven't had any since last Fourth of July," he observed in plaintive reminiscence as they went upstairs.

"Why, David Dunne, how you talk! You just come over here whenever you feel like eating ice cream, and I'll make you some. It's no trouble."

They sat down on the west, vine-clad porch to enjoy their feast in leisure and shade. M'ri had never lost her childish appreciation of the delicacy, and to David the partaking thereof was little short of ectasy. He lingered longingly over the repast, and when the soup plate would admit of no more scraping he came back with a sigh to sordid cares.

"Mother couldn't get the washing done noways to-day. She ain't feeling well, but you can have the clothes tomorrow, sure. She sent you some sorghum," pointing to the pail.

M'ri took the donation into the kitchen. When she brought back the pail it was filled with eggs. Not to send something in return would have been an unpardonable breach of country etiquette.

"Your mother said your hens weren't laying," she said.

The boy's eyes brightened.

"Thank you, Miss M'ri; these will come in good. Our hens won't lay nor set. Mother says they have formed a union. But 'most forgot to tell you—when I came past Winterses, Ziny told me to ask you to come over as soon as you could."

"I suppose Zine has got one of her low spells," said Barnabas Brumble, who had just come up from the barn. "Most likely Bill's bin gittin' tight agin. He—"

"Oh, no!" interrupted his sister hastily. "Bill has quit drinking."

"So that's how I am known around with Bill is, he can't stay quit. I see him yesterday comin' down the road zig-zaggin' like a rail fence. Fust she knows, she'll hev to be takin' washin' to support him. Sometimes I think 't would be a good idee to let him git over the road onct. Mebby 't would learn him a lesson—"

He stopped short, noticing the significant look in M'ri's eyes and the two patches of color spreading over David's thin cheeks. He recalled that four years ago the boy's father had died in state prison.

"You'd better go right over to Zine's," he added abruptly.

"I'll wait till after dinner. We'll have it early."

"Hev it now," suggested Barnabas.

"Now!" ejaculated David. "It's only halfpast ten."

"I could eat it now jest as well as I could at twelve," argued the philosophical Barnabas. "Jest as leave as not."

There were no ironclad rules in this comfortable household, especially when Pennyroyal, the help, was away.

"All right," assented M'ri with alacrity. "If I am going to do anything, I like to do it right off quick and get it over with. You stay, David, if you can eat dinner so early."

"Yes, I can," he assured her, recalling his scanty breakfast and the freezer of cream that was to furnish the desert. "I'll help you get it, Miss M'ri."

He brought a pail of water from the well, filled the teakettle, and then pared the potatoes for her.

"When will Jud and Janey get their dinner?" he asked Barnabas.

"They kerried their dinner to-day. The scholars air goin' to hev a picnic down to Spicely's grove. How comes it you ain't to school, Dave?"

"I have to help my mother with the washing," he replied, a slow flush coming to his face. "She ain't strong enough to do it alone."

"What on airth kin you do about a washin', Dave?"

"I can draw the water, turn the wringer, hang up the clothes, empty the tubs, fetch and carry the washings, and mop."

Barnabas puffed fiercely at his pipe for a moment.

"You're a good boy, Dave, a mighty good boy. I don't know what your ma would do without you. I hed to leave school when I wa'n't as old as you, and git out and hustle so the younger children could git eddicated. By the time I wuz foot-loose from farm work, I wuz too old to git any larnin'. You'd orter manage someway, though, to git eddicated."

"Mother's taught me to read and write and spell. When I get old enough to work for good wages I can go into town to the night school."

In a short time M'ri had cooked a dinner that would have tempted less hearty appetites than those possessed by her brother and David.

"You ain't what might be called a delikit feeder, Dave," remarked Barnabas, as he replenished the boy's plate for the third time. "You're so lean I don't see where you put it all.

David might have responded that the vacuum was due to the fact that his breakfast had consisted of a piece of bread and his last night's supper of a dish of soup, but the Dunne pride inclined to reservation on family and personal matters. He speared another small potato and paused, with fork suspended between mouth and plate.

"Mother says she thinks I am hollow inside like a stovepipe."

"Well, I dunno. Stovepipes git filled sometimes," ruminated his host.

"Leave room for the ice cream, David," cautioned M'ri, as she descended to the cellar.

The lad's eyes brightened as he beheld the golden pyramid. Another period of lingering bliss, and then with a sigh of mingled content and regret, David rose from the table.

"Want me to hook up for you, Mr. Brumble?" he asked, moved to show his gratitude for the hospitality extended.

"Why, yes, Dave; wish you would. My back is sorter lame to-day. Land o' livin'," he commented after David had gone to the barn, "but that boy swallered them potatoes like they wuz so many pills!"

"Poor Mrs. Dunne!" sighed M'ri. "I am afraid it's all she can do to keep a very small pot boiling. I am glad she sent the sorghum, so I could have an excuse for sending the eggs."

"She hain't poor so long as she hez a young sprout like Dave a-growin' up. We used to call Peter Dunne 'Old Hickory,' but Dave, he's second-growth hickory. He's the kind to bend and not break. Jest you wait till he's seasoned onct."

After she had packed a pail of ice cream for David, gathered some flowers for Ziny, and made out a memorandum of supplies for Barnabas to get in town, M'ri set out on her errand of mercy.

The "hooking up" accomplished, David laden with a tin pail in each hand and carrying in his pocket a drawing of black tea for his mother to sample, made his way through sheep-dotted pastures to Beechum's woods, and thence along the bank of the River Rood. Presently he spied a young man standing knee-deep in the stream in the patient pose peculiar to fishermen.

"Catch anything?" called David eagerly.

The man turned and came to shore. He wore rubber hip boots, dark trousers, a blue flannel shirt, and a wide-brimmed hat. His eyes, blue and straight-gazing, rested reminiscently upon the lad.

"No," he replied calmly. "I didn't intend to catch anything. What is your name?"

"David Dunne."

"You must be about twelve years old."

The man mediated.

"How did you know?"

"I am a good guesser. What have you got in your pail?"

"Which one?"

"Both."

"Thought you were a good guesser."

The youth laughed.

"You'll do, David. Let me think—where did you come from just now?"

"From Brumble's"

"It's ice cream you've got in your pail," he said assuredly.

"That's just what it is!" cried the boy in astonishment, "and there's eggs in the other pail."

"Let's have a look at the ice cream."

David lifted the cover.

"It looks like butter," declared the stranger.

"It don't taste like butter," was the indignant rejoinder. "Miss M'ri makes the best cream of any one in the country."

"I knew that, my young friend, before you did' It's a long time since I had any, though. Will you sell it to me, David? I will give you half a dollar for it."

Half a dollar! His mother had to work all day to earn that amount. The ice cream was not his—not entirely. Mis M'ri had sent it to his mother. Still—

"'T will melt anyway before I get home," he argued aloud and persuasively.

"Of course it will," asserted the would-be purchaser.

David surrendered the pail, and after much protestation consented to receive the piece of money which the young man pressed upon him.

"You'll have to help me eat it now; there's no pleasure in eating ice cream alone."

"We haven't any spoons," commented the boy dubiously.

"We will go to my house and eat it."

"Where do you live?" asked David in surprise.

David's freckles darkened. He did not like to be made game of by older people, for then there was no redress.

"There isn't any house within two miles of here," he said shortly.

"What'll you bet? Half a dollar?"

"No," replied David resolutely.

"Well, come and see."

David followed his new acqaintance around the wooded bank. The river was full full of surprises to-day. In midstream he saw what looked like a big raft supporting a small house.

"That's my shanty boat," explained the young man, as he shoved a rowboat from shore. "Jump in my boy."

"Do you live in it all the time?" asked David, watching with admiration the easy but forceful pull on the oars.

"No; I am on a little fishing and hunting expedition."

"Can't kill anything now," said the boy, a derisive smile flickering over his features.

"Never failed on corn or wheat"

"I never failed on either corn or wheat" — says Neeley Scranton, whose farm is near Pryor, in

Eastern Oklahoma
along the M., K. & T. Ry.

"I came to Mayes County 5 years ago and paid $35 per acre for my farm of 120 acres. My principal crop is wheat and I raise from 17 to 30 bushels per acre **every year.** What I am doing others near me are doing. I came here from Missouri and never regretted coming"

It's easy to understand why the farmers there make good money when you consider the good climate. First, there s a long growing season; plowing begins in February and harvests extend into December (yet summer temperatures are no higher than up north.) Second, short winters, so mild that stock can graze nearly the whole year and need little or no shelter—that brings winter expenses **way down.** And remember, **Eastern Oklahoma** is in the rich, level land section where the rainfall is as **great** as in Missouri, Iowa or Illinois—40 to 45 inches, well distributed through the growing season. As the U. S. Gov't says, "Eastern Oklahoma is **exceptionally** favorable for agriculture" and farmers who **go** there **prove** that this statement is **true.**

Send for free booklets

published by the Eastern Oklahoma Farm Bureau, composed of bankers and business men who have no land to sell but are interested solely in inducing practical, substantial farmers to settle and develop the fine farm lands there—lands at $10 to $60 per acre, which will raise as high as 30 bu. of wheat, 75 bu of corn, 80 bu. of oats and 6 tons of alfalfa a season. Write for these booklets now!

R. W Hockaday,
Colonization Agent, M. K. & T. Ry.
1535 Railway Exchange. St. Louis, Mo

"I am not hunting to kill, my lad. I am hunting old scenes and memories of other days. I used to live about here. I ran away eight years ago when I was just your age."

"What is your name?" asked David interestedly.

"Joe Forbes."

"Oh," was the eager rejoinder. "I know. You are Deacon Forbes' wild son that ran away."

"So that's how a am known around here, is it? Well, I've come back, to settle up my father's estate."

"What did you run away for?" inquired David.

"Combination of too much stepmother and a roving spirit, I guess. Here we are."

He sprang on the platform of the shanty boat and helped David on board. The boy inspected this novel house in wonder while his host set saucers and spoons on the table.

"Would you mind," asked David in an embarrassed manner as he wistfully eyed the coveted luxury, "if I took my dishful home?"

"What's the matter?" asked Forbes, his eyes twinkling. "Eaten too much already?"

"No; but you see my mother likes it and she hasn't had any since last summer. I'd rather take mine to her."

"There's plenty left for your mother. I'll put this pail in a bigger one and pack ice about it. Then it won't melt."

"But you paid me for it," protseted David.

"That's all right. Your mother was pretty good to me when I was a boy. She dried my mop of hair for me once so my stepmother would not know I'd been in swimming. Tell her I sent the cream to her. Say, you were right about Miss M'ri making the best ice cream in the country. It used to be a chronic pastime with her. Thats how I guessed what you had when you said you came from there. Whenever there was a picnic or a surprise party in the country she always furnished the ice cream. Isn't she married yet?"

"No."

"Doesn't she keep company with some lucky man?"

"No," again denied the boy emphatically.

"What's the matter? She used to be awfully pretty and sweet."

"She is now, but she don't want any man."

"Well, now, David, that isn't quite natural, you know. Why do you think she doesn't want one?"

"I heard say she was crossed once."

"Crossed, David? And what might that be?" asked Forbes in a delighted feint of perplexity.

"Disappointed in love, you know."

"Yes; it all comes back now—the gossip of my boyhood days. She was going with a man when Barnabas' wife died and left two children—one a baby—and Miss M'ri gave up her lover to do her duty by her brother's family. So Barnabas never married again?"

"No; Miss M'ri keeps house and brings up Jud and Janey."

"I remember Jud—mean little shaver. Janey must be the baby."

"She's eight now."

"I remember you, David. You were a little toddler of four—all eyes. Your folks had a place right on the edge of town."

"We left it when I was six years old and came out here," informed David.

Forbes' groping memory recalled the gossip that had reached him in the Far West. "Dunne went to prison," he mussed, "and the farm was mortgaged to defray the expenses of the trial." He hastened back to safer channel.

"Miss M'ri was foolish to spoil her life and the man's for fancied duty," he observed.

David bridled.

"Barnabas couldn't go to school when he was a boy because he had to work so she and the other children could go. She'd ought to have stood by him."

"I see you have a sense of duty, too. This county was always strong on duty. I suppose they've got it in for me because I ran away?"

"Mr. Brumble says it was a wise thing for you to do. Uncle Larimy says you were a brick of a boy. Miss Rhody says she had no worry about her woodpile getting low when you were here."

"Poor Miss Rhody! Does she still live alone Does she still live alone? And Uncle Larimy—is he uncle to the whole community? What fishing days I had with him! I must look him up and tell him all my adventures. I have planned a round of calls for to-night—Miss M'ri, Miss Rhody, Uncle Larimy—"

"Tell me about your adventures," demanded David breathlessly.

He listened to a wondrous tale of western life, and never did narrator get into so close relation with his auditor as did this young ranchman with David Dunne.

"I must go home," said the boy reluctantly when Joe had concluded.

"Come down to-morrow, David, and we'll go fishing."

"All right. Thank you, sir."

With heart as light as air, David sped through the woods. He had found his Hero.

(To be continued.)

Will you try the new Grains, Feterita and Sudan Grass at our expense, with the Flower Garden, as shown above, thrown in for good measure? See our offer below.

Feterita, the new cereal. This new grain is proving itself to be of wonderful value in times of drouth. It will grow and mature a crop of seed in from 75 to 90 days time. One single seed will make a plant having from five to ten stalks and each stalk will grow a head of seed, the larger ones weighing about one pound. These heads of grain are easily gathered and stored and have a variety of valuable uses. Crush the grains and cook them and you have a nice breakfast cereal. The grain when ground into flour makes a very fair substitute for wheat flour. Feterita is very much like Kafir in chemical composition and of all its different uses perhaps the greatest is its value as a food for poultry. A small field will grow enough seed for a good size flock of chickens and the fodder is readily eaten by horses and cattle. We want to send you a package of seed large enough to plant a 2 rod square patch of ground. This will give you a chance to try it as a breakfast cereal and enough to see what it will do as a poultry feed. If you like it you can save eough seed from this trial planting to plant a large acreage next year. See our offer below.

Sudan Grass. This wonderful new hay crop is succeeding in all parts of the country. It grows from seven to nine feet tall and stools out very thickly, a single seed producing a plant that will throw up from thirty to sixty stems. Sudan Grass does not lodge and go down after rain and wind storms as does millet and other grains. Horses, cattle and other stock like it and thrive on it in all stages, green or cured. A small patch will grow enough extra fine hay to provide for a horse and cow. The plant is an annual and dies root and branch in fall or after maturing a crop of seed. Usually makes from two to three cuttings of hay per season. Succeeds in dry season where most of other crops would be burned out.

We want to send you a package of Sudan Grass seed sufficient to plant a 2 rod square patch of ground. From this trial patch you can raise enough seed to plant a large acreage another year. See our offer below.

Our Flower Garden. We always did admire a nice flower garden and in this special bed we have over 150 different varieties of our choicest annuals that will commence to bloom early in season and continue until stopped by frosts in fall. This flower bed will be a constant source of pleasure and delight to you as the different varieties come into bloom.

We want to send you a large package of seed, enough to plant a bed a rod long.

Our Offer.—Send us a dollar to renew your subschiption to **The Missouri Farmer**—or if your subscription is paid up send us a new subscription at three years for one dollar, when we will send you postpaid a package of **Feterita** sufficient to sow a two rod square patch of ground and a package of **Sudan Grass sufficient for a bed a rod long.** With the seeds will be full directions for sowing, etc., and from these plots you will derive enough seed to furnish you with a supply for future use. **Cut out and mail the coupon to-day.**

THE MISSOURI FARMER, - COLUMBIA, MO.

Gentlement:—For the inclosed Dollar please send **The Missouri Farmer** for three years and the FETERITA, SUDAN GRASS and FLOWER SEEDS as per your offer, to the name below.

REAL HELPS FOR FARM BUILDERS

"Service" is the slogan of the Southern Pine Association, an organization of southern lumber manufacturers who are working together to promote the proper use of wood in building. One important feature of the Association "service" is the free distribution of informative booklets dealing with building and repair work on the farm. Included in this literature is a booklet on "How To Choose and How To Use a Silo," "Lumber Pointers," and other publications that give much valuable information to farmers while advocating the use of southern yellow pine as the most economical and durable wood for farm building. Supplementing the booklets sent out by the Association are detailed working plans, with lumber bills complete, for various priced homes, barns, garages, granaries, feed shed and numerous smaller farm buildings. The plans also are free.

This material, intended to stimulate building and thereby improve living and working conditions on the farm, is distinctly helpful to the rural resident, whether or not he lives in a locality where southern yellow pine may be obtained. The building helps are prepared by experts, and the booklets are written by authorities on the various subjects treated. The distribution of the Southern Pine Association's free "Service" material affords one of those rare opportunities to get for nothing something really worth while, and every farmer contemplating building improvements should send for such of the literature and plans as treat of his requirements. There is absolutely no cost involved in requesting this material—the Southern Pine Association has nothing to sell to you. The service is free. Requests, stating your needs, should be addressed to the Southern Pine Association, 619 W. Interstate Bank Building, New Orleans, La.

We would like to have our boy readers write us and tell us what they think of the new serial "David Dunne."

A BANKER FRIEND

Marshall, Mo., Mar. 18, 1916.
The Missouri Farmer,
Columbia, Mo.
Dear Sirs:
Here is my "It's Up to You" two dollars, on subscription. I am a banker in a farming community and I think THE MISSOURI FARMER the best paper published for Missouri farmers. W. S. Huston.

We would like to have our poultry raisers write us stories of their success in finding other markets than the ordinary store trade for their eggs and chickens. Two cents added to the price obtained for a dozen eggs or two cents a pound added to the price received for poultry will add a great many thousands to the income of Missouri poultry raisers.

Angus Average $130 at East St. Louis

The two days auction of Angus cattle held at East St. Louis, March 15th and 16th, under the management of M. A. Judy, resulted in the fair average of $130 on the 99 head sold. The first sale, held Wednesday, was a breeders sale, in which the general average was $138.

The second day was occupied with the dispersion of the Durrstein Bros'. herd from Scales Mound, Ill. In this sale 41 head sold for $5465.00 an average of $133. The major portion of the two offerings went to Arkansas, Tennessee, Missouri, Mississippi and Souteast.

Well Bred Polands Worth the Money

Hall & Rapp, Rocheport, Mo., are offering our readers some exceptionally well bred Poland China boars at prices that should move them in a hurry. Write this form for further information.

Jersey's and Spotted Polands

The Ennis Stock Farm, Horine Station, Mo., offers the readers of this paper splendid values in Jersey Cattle and spotted Poland China hogs. Write for prices.

Sutherland's Angus

D. L. Sutherland & Sons, Windsor, Mo., who advertise Angus cattle in this paper advise us that their cattle have come through the winter in fine shape and add that they are very anxious to dispose of a number of young bulls and cows in order to make room for the young stuff that is coming on. We know that a great many readers of The Missouri Farmer have made satisfactory purchases from this herd and all speak very highly of the fair treatment accorded them by this firm. We are glad to recommend this herd to our readers who are in the market for good useful cattle and trust that when you write that you will bear in mind that Messrs. Sutherland will appreciate very much your mentioning where you saw their ad.

Brockman's Durocs Have the Size

Perhaps no herd of Durocs in Missouri can show more size than the herd maintained by A. C. Brockman, Centralia, Mo., Mr. Brockman is a practical hog man in every sense of the word and the types of Durocs he has developed are the profitable kind as evidenced by the fact that they make money for Mr. Brockman. Our readers will be serving their own interests if they investigate this herd before placing their orders for Duroc breeding stock.

Want a Smooth Columbus Boar?

Bennett Bros., Lee's Summit, Mo., report that they are having splendid success in saving their spring pigs by their great boar, Smooth Columbus, and advise that they are now ready to book orders for boars of spring farrow to be shipped at weaning time. It will be well to keep in mind that for two years the blood of Smooth Columbus has been selling at the top or near the top in Missouri—that it has been proven to be prepotent of the type sought after by careful buyers. Now is a good time to place your order for a boar—the price will be right, the express charges light and our readers can depend upon fair treatment from this firm.

Dr. Unsell's Durocs

In another column Dr. J. B. Unsell, Louisiana, Mo., announces that he now has for sale a very select lot of fall boars has for sale a very select lot of fall boars. Perhaps no herd in the state has than the Clover Leaf herd. The attention of the breeders has been centered on this collection of Durocs largely because of the notable high character of breeding animals the Doctor has been purchasing. Many of the top sows of the past two years will be found in this herd and the class of herd boars used has been such as to place the herd in the front rank. Most of the boars now in offer are by Unsell's Defender, a tremendously big son of the noted Defender and out of Model Princess 1st by Model Cherry. If there is one thing more than another Dr. Unsell insists on, it is size. He bought the big kind of boars and sows,

POLAND CHINAS

Smooth Columbus
THE BOAR THAT PUT MISSOURI ON THE MAP. HEADS OUR HERD

SMOOTH COLUMBUS BLOOD has held the record in Missouri for two years—it will do it again next year. Fall pigs, either sex, by this great boar, now offered for sale.

to start with and he is a "regular crank" on feeding the proper ration. Consequently the fall stuff is unusually large.

Look up the advertisement in this issue and write for prices. Kindly mention this paper.

Garrard & Son's Durocs

Brown Garrard, junior member of the firm J. C. Garrard & Son who advertise Durocs in this paper, was in the office last week and informed us that he was entirely sold out of bred sows and gilts and practically sold out of boars, with the exception of a few of September farrow. This firm is now offering a two year old boar, sired by Welle's Example and out of a Whiskey and Faith sow. Messrs. Garrad have no further use of this boar an' a e therefore pricing him very low.

PREPAREDNESS AT FARROWING TIME IS MONEY SAVED

Farmers who intelligently feed and care for their pregnant sows, so as not to overload them with fat, but instead give them feeds for the development of bone and muscle, are on the right road toward the production of strong, healthy litters. Their preparedness program, however, does not end here.

Two weeks before farrowing the sow should be put into a farrowing pen so that she will become acquainted and contented in her new quarters. The farrowing pen should be dry and free from draughts. Provide the pen with a guard rail made of 2 by 4-inch planks set 8 inches from the wall and 8 inches from the floor to prevent the sow from crushing the pigs against the wall. Use only a small quantity of bedding; leaves or straw are preferable. See that the sow has plenty of fresh water.

It pays to keep the sow quiet. Assistance at the time of farrowing should be at hand if needed, but the sow need not be helped if she is getting along well. In cold weather put the newly born pigs in a well warmed basket and after farrowing is over the pigs should be placed with the sow, care being taken that each one gets to a teat. When the afterbirth is passed, it should be removed from the pen at once and burned or buried.

After farrowing the sow should have nothing but water and a little thin slop for the first day. The feeding for the first three or four days should be light, and the time consumed in getting the sow on full feed should be from a week to ten days, depending on the condition of the sow and the size and thrift of the litter. It takes plenty of sow's milk to make healthy growing pigs. If the pigs begin to scour, feed the sow less and give her plenty of strong lime water.

It is very necessary that the little pigs have plenty of exercise and all the sunlight that can be given them. Do not allow the pigs to run out during a cold rain. If possible, provide green feed or roots. These keep the so v healthy and cheapen the ration. Encourage the pigs to eat grain after they are three or four weeks old. Build a creep for them so they can feed alone. At this age feed for bone and muscle. Give them all the skim milk you can. If skim milk is not available, give them some meal and plenty of pasture. In about eight or ten weeks the pigs will have practically weaned themselves. After they have been successfully weaned the most perplexing job is over.

By putting into practice the essential points above mentioned the number of pigs raised to weaning should be increased. Hogs never fail to respond to good care. Kind treatment always means contentment with its corresponding profits.

—Press Bulletin U. S. Department of Agriculture.

Hogs Fed on Rape Need Some Grain

Can you afford to feed grain to your hogs this summer?

R. C. Ashby, in charge of swine at University Farm, St. Paul, says you c^n not afford to grow them without grain. He gives the results of three tests of feeding corn to hogs on rape pasture to prove his claim.

Six 50-pound pigs were put in each of three lots, about a quarter of an acre in size, on rape pasture. The pigs in the first lot were fed a half ration—2 per cent of corn; that is, two pounds of corn for every one-hundred pounds of live weight. Those in the second lot were fed three pounds of corn for every one hundred pounds of pig; that is, 3 per cent. The pigs in the third lot were fed a full ration, 4 per cent, of corn. The pigs were on good rape pasture eleven weeks—from July 10 to September 26. Their gains were counted as worth 7 cents a pound and corn was charged at 55 cents a bushel.

The returns paid for the rape pasture an acre were: Lot No. 1, $52.80; lot No. 2, $66.72; lot No. 3, $65.60. If the corn is figured at 75 cents a bushel, the balance for the pasture on the three lots would be $43.16, $51.36 and $45.60, respectively.

Without the feeding of grain, the pigs would have gained little, Mr. Ashby says. Rape may be expected to pay $50 an acre as pasture only with the proper feeding of grain.

Even Good Dogs Spread Disease

That good friend of the farmer, the dog, will have to be looked after more carefully, if he is not to do as much harm as good on the farm. According to a bulletin issued by the United States Department of Agriculture, Towser has been found to be a carrier of such diseases as rabies, hydatid, ringworm, favus, double-bored tapeworm, roundworm, and tongueworm. All of these are diseases which afflict human beings. Occasionally, also, the dog carries flees and ticks, which in turn transmit bubonic plague and the deadly spotted fever.

In these days of the foot and mouth disease, too, farmers should see to it that their dogs do not bring home the fatal germs, or, if they have any disease on their own farms, they should take pains to prevent their dogs from carrying it to their neighbor's farms.

A Remedy for Clover Bloat

The cause of and a remedy for clover bloat have been found by D. J. Healy and J. W. Nutter of the Kentucky Agricultural Experiment Station. These facts are announced in Circular No. 5, recently issued by the Kentucky station.

Red clover blossoms contain about 3.6 per cent of sugar; alfalfa blossoms, 2.8 per cent; white clover blossoms, 2.4 per cent. After being eaten by stock, this sugar undergoes rapid fermentation and is converted into carbon dioxide. This causes the bloating.

The authors of the bulletin strongly recommend for acute bloating, one quart of 1½ per cent solution of formalin. After this is administered, a wooden block should be placed in the animal's mouth, and the animal should be given gentle exercise if it can be gotten on its feet.

Formalin is a trade name for a 40 per cent solution of formldehyde gas in water and may be obtained at any drug store for about 40 cents a pint. One-half ounce of formalin in one quart of water is the proper solution with which to drench an animal.

REID'S YELLOW DENT SEED CORN Champion at Missouri State Show. Indiana type. The kind that has a deep, meaty grain; small cob; large ears; and yielded this year as high as 115½ bushels to the acre. $2.50 to $3.00 shelled; $3.50 to $4.00 crated in ear. F. O. B. Germination guaranteed. H. G. WINDSOR, Benvenue Farms, Boonville, Mo.

FAWN AND WHITE INDIAN RUNNER DUCKS

Most profitable of fowls. Healthy, fast maturing, steady layers, require little attention, and the birds I offer are specially bred for these good points. Have never been beaten in show room. Prize stock is dependable stock—it is good to start with and a good performance may be counted on, with reasonably good attention. Write to me—I'll be glad to tell you more good points about Indian Runner Ducks and quote prices on them. Also have Golden Laced, Silver Laced and White Wyandottes—blue-ribbon winners wherever shown.

THE GRAND CHAMPION DAIRY COW OF THE WORLD

Champion Jersey Cow of the World, Sophie 19th, of Hood Farm, 189748. Register of Merit test, one year, 17,557 lbs. 12 oz. milk; 1175 lbs. 7 oz. butter. Register of Merit test, five years, 64,005 lbs. 4 oz. milk; 4414 lbs. 14 oz. butter.

Isn't she a beauty? She's a typical granddaughter of Sophie's Tormentor, the bull who has produced the greatest family of economical milkers in the world. The Jersey is the money cow. She produces the richest milk on the plainest feed and she's hardy, gentle and lovable. The American Jersey Cattle Club, 320 West 23rd St., New York City, has helped thousands of dairymen determine on the right breed. Get their interesting book, "The Story of the Jersey." You'll be interested.

NEW COMMUNITY BREEDING ASSOCIATIONS

"In union there is strength" in stock raising as well as in numerous other lines has long been the conviction of the Missouri College of Agriculture. There are many things which can be done much better and more economically on a large scale than on a small one. It is almost as easy to advertise Shorthorn or Hereford cattle for an entire community breeding association as for an individual breeder and somewhat similar statements might be made with regard to a number of other problems. Even those things which each man must do for himself are done much better if the breeder is in constant touch with fifteen or twenty other men engaged in solving the same problems.

The Harmony Shorthorn Breeders' Association was recently organized at Ravenwood in the extreme northwest corner of Missouri and the St. Francois County Hereford Association is well under way in the opposite corner of the state, while a more general feeders' and breeders' association is undertaking to advance live stock interests in Carroll County. The Harmony Association was organized with 15 charter members who plan to have 150 Shorthorn cows by next fall. The cows are to be owned by the individual members, but the Association plans to buy a bull on the stock company plan. This should insure securing a much better animal than any one of the members could afford to own and make it easier to change in case a poor breeder should be secured. One of the guiding spirits in this Association is a rural minister who seems to have a good grasp on the situation and the point of view which leads a man to believe that a man who is a leader of men on one day of the week may well work and plan with them on the other six days as well.

The St. Francois County Hereford Breeders' Association was organized in the fall of 1915 with 12 charter members in a county in which there were 22 Hereford herds and a number of other pure bred herds. It has held a sale at Jacksonville, Mississippi for the sake of advancing and establishing business relations and a market for later years. As an outgrowth of this sale there is now a community breeders' association at Jacksonville which will undoubtedly send buyers to Farmington where the St. Francois County Association will hold its sale next fall. At this sale there will not only be breeding stock offered by the various members of the Association but also select cars of feeders to attract buyers of another class and show that the members of the Association are willing to use the knife on animals that will not be kept for breeding purposes.

Such associations enable their members to attract more buyers and bigger buyers than could be attracted if many different breeds of cattle were being offered by men who had relatively small herds. It is easy for them to arrange combination sales without the necessity of shipping to central points or to hold sales on successive days in the same territory so that a buyer may not be compelled to make long trips between sales.

S. T. Simpson,
Missouri College of Agriculture.

Aberdeen-Angus Breeders' Association Sales

Every breeder in general and prospective bull buyer in particular should be especially interested in Aberdeen-Angus Breeders' Association Spring Bull Sales, which are to be held April 25, 1916, at Stock Yards, St. Joseph, Mo.; April 26, 1916, at Stock Yards, South Omaha, Neb.; April 27, 1916 at Stock Yards, Sioux City, Ia., and May 2, 1916, Stock Yards, East St. Louis, Ill.

Two hundred and sixty-five head of top-notch bulls ready for service have already been cataloged for the sales. There are bulls that will suit the needs of the veteran breeder to head his herd, bulls that will suit the farmer who wishes to produce steers that will top the market and bulls that are matured and ready to do heavy service on the ranges of the West and plantations of the South.

Never before has the American Aberdeen-Angus Breeders' Association spent so much time and money to advance the interests of its breed. These Spring Bull Sales have long been needed in order to assemble a large number of bulls at one point so that rangemen, breeders and farmers will be afforded an opportunity to secure their needs in form of single individuals or in carload lots.

The Association will manage these sales with the single object of making them a success for the consignor, as well as the buyer, without having to consider pecuniary profit which is usually paramount, thus , prospective buyers can attend these sales with the absolute confidence that the Association will look after their interests.

The bulls cataloged for these sales practically comprise all the bulls of serviceable age in the country at present, thus, every breeder, farmer and rangeman in need of a bull should avail himself of this last and only opportunity to secure his needs for the season.

The list of consignors to these soles is as follows.

St. Joseph: J. D. Blackwell, O. P. Botkin, Carden & Morris, E. A. Cobb & Son, David Bros., Leslie R. Falk, J. C. Fryar & Son, J. L. Gohlinghorst, R. E. Gordon, William Gubser, Hadley Bros., J. W. Hanna, W. A. Holt, W. A. Montgomery, Wm. Palmer, G. L. Sage, and L. J. Sundermann.

St. Louis: John Althaus & Sons, F. A. Clark, W. J. Crump & Sons, W. A. Holeman, Wm. Krueger, Simon E. Lantz, Charles W. Nobis, Judge Harry Olson, James Rhodes, Richey & Son, Anson Rosenkrans, M. S. Smith & Son and C. J. Whistler & Sons.

Don't forget there are 265 selected bulls to select from and that there will be bargains because the bulls will be sold to the highest bidder, even if they do not bring more than a beef price.

Show Classification: There will be a liberal classification of prizes offered at each sale. A class for bulls over 18 months and another class for bulls under 18 months. Breeders in need of an outstanding bull for a herd header should arrange to see the judging. The bulls that win prizes will be sold first, according to their rating.

Send to Charles Gray, 817 Exchange Ave., Chicago, for catalogs of these sales or for any further information you desire.

MY 1916 SPLIT HICKORY BUGGY BOOK

Just drop me a postal and I will send you a copy of my big, new, 1916 Buggy Book, Free and Postpaid. 65 BULLS, 10 COWS	At East St. Louis, Ill., Stock Yards,	Tues., May 2

Judging begins promptly at 9 a.m. Sales begin at 1 p.m. except Omaha sale which begins at 10 a.m

Parties in the market for bulls should bear in mind they have the leading breeders and the American Aberdeen-Angus Breeders' Association behind this offering.

There are listed Blackbirds, Ericas, Prides of Aberdeen, Queen Mothers. Heather Blooms, Barbaras and top-notch representatives of other leading families.

The Association's paramount object is to create central trading points regardless of expense. Rangemen can select carload lots at these sales and the farmer can secure a single bull or any desired number. The breeders who have consigned the bulls are prepared to sell them at farmers' prices.

Don't forget,cattlemen, breeders and rangemen, the Aberdeen-Angus is the greatest beef bred in the world. This has been demonstrated at all the leading shows of the country.

At Chicago, out of a possible fourteen prizes for single steers. Aberdeen-Angus have won ten grand championships and eight reserves. In the fat carloads they have won eleven out of a possible fourteen, and out of fourteen grand championships for carcass, they won thirteen times.

Aberdeen-Angus have also proved their superiority in feeder competition at all the leading shows and stock yards of the country by winning grand championships and selling at record prices.

If you are in need of a bull or bulls and cannot attend sale or sales, send your order to your commission man.

The Love Lamp

There are a lot of very beautiful things in this world if we will only keep our eyes and hearts in a receptive mood to comprehend them. The trouble is that too often our vision is confined to the narrow path over which we travel in pursuing our chosen task—and thus we stumble along, looking neither to the right nor to the left and in consequence we miss a thousand pretty things which make life truly worth while. The other day I alighted from a limited train in a big eastern railroad station. Immediately ahead of me was a big fellow whose temples were just turning gray and who seemed unusually anxious to crowd out ahead of the other passengers—and in a moment I understood the reason. No sooner had his feet touched the depot platform than a fine looking woman with a bunch of red cheeked youngsters clinging to her skirts threw herself into his arms and as their lips met the resulting concussion was plainly audible over the clamor of the "Red Caps" and the groaning of the giant engines. Then the "kids" with lusty shouts of "Hello Daddy!" threw themselves upon him and at him—a veritable charge of the "Light Brigade" and there were a lot more resounding smacks. All at once the proud, flushed father glanced about him and exclaimed in some degree of alarm, "Where's Bobby?"—and no sooner were the words out of his mouth than the aforesaid "Bobby" dodged out from between a big man's legs where he had become entangled during the onslaught and shouted, "Here I is Daddy!" Although I didn't have any time to lose I lingered behind just to watch the joy of the little covey—all with faces beaming and all trying to talk at once—and thus, after a moment, they disappeared among the thousands who surged through the big waiting rooms.

I don't know who "Daddy" was nor do I care. Possibly he may fit into some big place— and then again he may be one of the many thousands of every day, modest men whose unobtrusive qualities and splendid citizenship make them the real bulwark—the very bone and sinew of this mighty Nation. You touch elbows with them everywhere—out upon the myriad farms, in factory and market place, in school room and counting house, in the professions—everywhere in the highways and byways of life where honest men toil for an honest living. But this much I do know and for this much I do care—that the Love Lamp burns hrightly in this man's home—that the roof which shelters him and his loved ones covers an abode of happiness and from such family circles must come the God-fearing men and women whose clear, clean vision must guide the Republic aright in the unborn years of the future. Little danger indeed is there that the ugly scandal of divorce will ever cast its shadow across the threshhold of this home and the same concern which caused the anxious inquiry for "Bobby" is mighty apt to see to it that "Bobby" treads the path that leads to useful manhood as he grows up— and again, unless I am mightily mistaken the childish voice which shouted "Here I is Daddy!" will be full of tender solicitude for the father when time shall have whitened his locks and made faltering and slow the stalwart strides of yesterday.

I was the better off for having witnessed this pretty little drama and life seemed a bit brighter. And how much all of us need this kind of a tonic once in a while to convince us that there is a pile of happiness in the world, despite the sordid stories of wrecked homes and lives which crowd the daily newspaper. Again, this little incident reminded me that the purest and sweetest happiness in the universe finds its lodging place in the home. Here are brought the trophies that are won in the day's strife and toil. Here is the true refuge from the storm and from the hard and harsh things that wear away mens lives and souls. Here the disappointment that comes from chasing the elusive dollar is soon forgotten—if the Love Lamp shines brightly—if kind affection beams forth from the eyes of Father and Mother—if the little ones who shout "Daddy!" in childish glee truly believe that "Daddy" is the greatest man in the world.

FACTS OF GENERAL INTEREST

Wheat Unfit for Milling—This paper called attention to the misleading statements in the official wheat and corn crop reports last year because of the failure of the Government to take into account the great damage to wheat from wet weather and to corn from frost. After permitting these misleading reports to stand for eight months and to be used by speculators to hammer down the price of grain the Government on April 3 issued a statement showing that 14.4 per cent of the wheat crop of last year was unfit for milling. While a lot of this damaged wheat was used to mix with better wheat and ground into a low grade flour or was exported for feed or to be used by making low grade flour, farmers know that quite a lot of it was either used as feed or lost entirely.

The report places the per cent of last year's crop fed to stock at 7.3 amounting to 74,000,000. This was nearly double the usual amount fed to stock. The report estimates that 29.9 per cent of Missouri's crop was not fit to mill and that 15.1 per cent of the crop was fed on the farm. It is stated by the report that a lot of the wheat that was unfit for making good flour was sold for shipment.

Value of Farm Lands Increasing.—It is estimated that an average acre of farm land in the United States is now worth $45.55 not counting improvements. There has been a pretty rapid increase for several years. In 1900 these same lands were worth about one-third what they are now—to be exact $15.57. In 1910 the value was about double or $32.40. There was an increase during the last year of $4.70 an acre while the average rate of gain has been about $2 an acre a year. The exceptional increase in the last year is attributed to the reaction in the Southern cotton states.

The only lands showing a decline are orchard lands and irrigated lands in the northwest which in some instances had been over valued.

Examine the Rape Seed.—Farmers who contemplate sowing rape for pasture should be very careful about buying seed this year because there is a temptation for unscrupulous seed dealers to sell turnip rape seed for the winter rape usually bought by farmers. The department says the seeds of turnip rape are smaller and have a more deeply pitted surface than those of winter rape. Winter rape produces a definite stem with leaves occurring along it at intervals. Turnip rape does not produce a definite stem, the leaves all growing in an apparent whorl at the surface of the ground. The leaves of winter rape are thick and succulent, free from hairs, and covered with a greyish bloom. The leaves of turnip rape are thin, hairy and bright green like those of the garden turnip. Persons who do not know of themselves about the difference between the two varieties should always try to buy of a thoroughly reliable dealer. Where the time is sufficient it is best to take a sample and send to the Free Seed Testing Labratory at Columbia and after getting their report the purchaser will know what he is buying.

Co-operative Shipping of Live Stock.—The first co-operative live stock shipping association reported to the United States Department of Agriculture was organized in 1908, but the business has been so successful that there are now approximately 500 of these associations. About 200 of them are in Minnesota. No capital is required to organize one of these associations. The best plan is to incorporate in a legal way and the cost is not usually very much. A manager is elected who attends to the ordering of cars, shipment, etc., and aside from whatever nominal sum is paid to the manager the seller gets whatever his stock brings in the market less expense of shipping and selling. This plan enables small farmers to get all the profit out of their live stock. Where several farmers furnish part of the stock to fill a car the different animals are identified by some brand or mark or number placed on the animals before shipment.

KEEP MILK SWEET

The approaching warm weather will make it necessary for dairymen and housewives to take extra precautions to prevent loss through souring of milk and cream. As milk is an ideal food for both babies and bacteria, it frequently happens that in warm weather the bacteria are the first to enjoy this delicate food. Though the acid developed in the milk during souring is not harmful to the health of adults, it is injurious to infants, and distasteful to many older people, and will surely cause dairymen to lose money.

A successful dairyman near the Missouri College of Agriculture has solved this problem by removing the causes. Since dirt is loaded with bacteria he first keeps both dirt and bacteria out of his milk, by using a small-top milk pail, by keeping his pails, cans, strainers, and other milk utensils clean, and by keeping his cows free from dirt and filth. This can be cheaply and efficiently done by thoroughly washing the utensils with hot water as soon after using as possible and setting them in a clean protected place to drain until used, by brushing the cows daily and preventing them from becoming dirty, by using plenty of bedding, and by keeping the barnyard clean.

Since bacteria will not sour milk unless they grow in it, he prevents their growth by cooling his milk as soon as produced and keeping it cool until delivered. The best of dairymen

cannot furnish milk so free from bacteria that it will not sour if left hours in a warm place. Both dairymen and housewives will do well remember that cleanliness and temperature (50° F.) will prevent loss.—Percy Werner, Jr., Missouri Agricultural Experiment Station.

What a Man Thinks About Women Voting

"Let me give you an argument those who question the morality justice of giving the ballot to women. More than 90 per cent of the inmates of the Nebraska penitentiary are men. You will find a majority of the women in the churches.

"If women are intelligent enough keep out of the penitentiary and have morality enough to go to church, there is no question of their fitness for the ballot. I believe it is only a question of time until women will share governmental burdens with men."

The Missouri Farmer

VOLUME VIII APRIL 15, 1916 NUMBER 8

The Robbery In Ocean Freights

By William Hirth, Publisher

That the question of an adequate, free and honest American Merchant Marine is a problem of tremendous importance to the American farmer becomes instantly apparent when one inquires even casually into the subject. It shows in a vivid manner the unseen enemies which prey upon the farmer's sweat and toil and once more emphasizes the fact that the hour has come when the tillers of the soil must put brains as well as brawn behind their work if our farm homes are to be rescued from the grave dangers which menace them at this time.

During the course of the average year the farmers of the United States sell surplus farm products to the balance of the world amounting to hundreds of millions of dollars and that there shall be ample shipping facilities to carry this surplus—and carry it at a reasonable rate—this anybody can see is a matter of transcendent importance. Liverpool is the worlds' great clearing house on surplus products whether agricultural or otherwise and the prices there fixed reflect themselves in the markets of every nation. What the American farmer realizes on his surplus therefore depends very largely upon the cost in reaching Liverpool and likewise this cost is reflected back on what he receives for the products consumed here in the United States.

Outrageous Ocean Freights

To give the reader an idea of what this question means to the farmer, during last December the farmers in the Palouse valley in the state of Washington concluded to ship several car loads of wheat direct from their elevators to Liverpool and thus save all middelmen's profits. This wheat was subsequently sold in Liverpool for $2.18 per bushel—but the Palouse farmers received only from 80 to 83 cents per bushel, the balance being eaten up by the outrageous ocean freights which obtain at this time and which, even considering the ordinary dangers of an ocean voyage because of the foreign war are out of all reason—for remember this wheat was intended for English consumption and enjoyed the protection of the great English fleet which is today supreme upon the high seas. To give the reader a further idea of what a tremendous advance has taken place in ocean freight rates, we quote the following figures showing the number of tons shipped and the amount which the vessels charged for transporting them.

1910 No. tons carried	52,374,614
Amount charged	$140,877,711
1912 No. tons carried	56,436,373
Amount charged	369,256,146
1914 Increase on same volume as of 1912	790,109,222
1915 Increase on same volume as of 1912	1,777,746,749

These figures show that there is something "rotten in Denmark" and that the war does not by any means explain away the present charge for ocean transportation. During 1910 and 1912 the world was at peace and yet the rate per ton increased from $2.72 to $6.72 between these years. Only 2,051,732 more tons of freight were hauled in 1912 than in 1910 and yet the increased charges amounted to the enormous aggregate of $228,378,375 Again, the German submarines were just as busy in the latter part of 1914 as they were during 1915 and yet on the basis of the 1914 charges there was an increase of $987,637,527—or almost a round billion dollars. When careful students of world conditions prophesied in 1914 at the outbreak of the war that wheat would sell for from $1.50 to $1.75 per bushel during 1915 they had sound reasons for the faith within them—but they did not foresee the outrageous robbery of these modern pirates of the seas who, under the pretext of war do what the pirates of the olden days did without apology and who had the honesty and candor to float a black flag from the mast heads of their vessels.

Enormous Dividends to Ship Owners

But to throw still further light on the situation as to whether the war is wholly a justification for existing conditions: Government statistics (Consular Reports) show that in 1908 the White Star line of ocean steam ships paid net dividends of 10% which ante dates the enormous jump in rates that took place between 1910 and 1912. No one would object to such dividends even though the ships are protected against loss or damage by marine insurance. But in 1909 this line declared a 20% dividend—while in 1910 it earned a net profit of $2,629,880 on a total investment of $3,630,000 after charging off an enormous sum for depreciation. The Holland-Amerika line earned about 50% on its investment during the fiscal year of 1913—long before the big guns had begun to bark in the great European conflict. These two lines are owned or controlled by J. Pierpont Morgan & Co., of New York.

The Hamburg-American Line earned about 30% net during 1913 while many English and other tramp steamers earned as much as 50%. These are just a few side lights on the profits in ocean traffic at a time when the world was at peace. To strike a general average of the increases which are contained in the above figures it means that on the most conservative basis the farmer's surplus pays a a tribute of 33c per bushel on wheat, $33 per ton on cotton, $1.25 per barrel on apples—and in like proportion on other products. And mind you, this average includes the several years ante-dating the war.

We have heard much in recent years about granting ship subsidies but in view of the above facts the average man will seriously question both the necessity and the good faith back of this proposal. And, as usual, the farmer gets the "hot end" of the deal. In the shipment of manufactured products the ship owners are compelled through a special agreement to file 30 or 60 days advance notice of a change in ocean freights. But this is not true of "bulk" commodities under which head wheat, cotton and other farm products are listed. The rates on such cargoes which constitute over 80% of ocean traffic may change overnight—and hence the farmer, although few realize it, is at the mercy of this "stuffed club" which strikes at him from the bosom of the seas. It affords a splendid opportunity for speculators to depress prices—for they always try to play safe against the ocean freights and hence see to it that they have a "long" margin—always long enough to make them safe and then some. When the rates go up the farmer is always stuck but when they go down he never hears of it. While the American manufacturer also has to pay extortionate rates, he has from 30 to 60 days advance notice of a raise and hence has an opportunity to make the ultimate buyer pay at least a part of it. While this gives him a decided adavantage over the farmer he nevertheless is handicapped in the sharp competition for the World's trade in which frequently the price means evertyhing.

Government Owned Merchant Ships

As a general proposition the writer does not believe in the policy of government ownership. With the power to regulate rates lodged in the federal government and the several states we believe, for instance, that the government ownership of railroads in this country would be a great mistake—for it would compel the government to assume a National debt running into the billions of dollars when it already exercises the right to regulate passenger and freight rates which is the crux of the whole question. If the various governments of the world exercised a similar authority upon the high seas we would oppose a government-owned merchant marine—but since they do not we believe that the proposal which is now before Congress to build or buy ships in which to transport American exports is a measure which should be speedily enacted into law in order that there may be an early end to the species of piracy which obtains at this time and which is exacting a tremendous annual tribute from the farmers of the United States.

A splendid, first class ship can be built for a million dollars. There is little question that the American farmer has paid a tribute of at least 75c per bushel on the wheat which was exported to Europe during the last nine months—and this means that if this margin had been used for building merchant vessels on even a hundred million bushels it would have provided 75 great American ocean steamers and this number of ships—or even less—would break up the monopoly of the seas which exists at this time. In fact, in our judgment, it will not be necessary for the government to embark in ship building on a wholesale scale. On the contrary we will need to go only so far as will enable us to set the pace in ocean freights. In the meantime of course the capitalistic

WHERE DO YOU STAND?

A few days ago we received a letter from a high class farmer in Johnson County criticising us for devoting so much attention to the organization of Farm Clubs. Said the complainant, "I think you would accomplish a great deal more good if you devoted more space to good farming methods and less to these organization schemes." That we have had much to say about co-operation among farmers we frankly confess. That we have neglected better farming methods, however, we do not admit for one moment—for during the regime of Mr. Ellis as Managing Editor of this publication no farm paper in the Corn Belt has tried harder to induce farmers to put thought and care into their farming operations than has The Missouri Farmer.

But, in our humble judgment, the time has come when there must be some real reward for good farming methods—when farmers must be assured that they will not be robbed out of the fruits of their thrift and toil and when this question overshadows all others, what inducement is there for a farmer to put thought and energy into his work when, within 48 hours, the Packing Combine or the Grain Gamblers can sweep away the profits of a whole years' work? In the meantime, our friend from Johnson County need not be afraid that The Missouri Farmer will neglect an ample discussion of pertinent farm questions and practices. On the contrary we are simply trying to assist farmers to the end where there will be a real reward for good farming methods. William Hirth, Publisher.

interests which are profiting from present conditions will set up a loud howl—but this is always to be expected. In a future article we will review the Shipping Bill which is now before Congress in order that our readers may have a better understanding of this measure and in order that they may write to members of Congress concerning it.

When the War Ends

When the great European War finally comes to an end the American farmer and manufacturer will have to fight for a place in the world markets as never before. Seeking to recoup the enourmous war expenditures the warring countries will try to sell as much and buy as little as possible—and that that Nation which is best equipped with ocean freighters will possess a tremendous advantage over those which are not similarly equipped goes without saying. In short, the time has come when a great American Merchant Marine is absolutely essential to the future well being of the Nation—and if it is impossible to build up a square dealing marine through private initiative then the government should take a hand—for just as the farmer is paying a tribute which would enable him to build Packing houses of his own, so he is paying a tribute to the ocean shipping monopolies which would enable him to build ships which will give him an untrammeld opportunity with his surplus products in the great world markets.

It is only another overwhelming proof of the fact that the hour has finally arrived when the farmer must do more hard thinking than ever before—when he must take a hand in directing the policies of the government—when he must cease to aimlessly drift with the current—for upon this depends the future of American Agriculture and the well being of himself and the children who are to come after him.

THAT NEW BREED OF HORSES

To The Missouri Farmer:

I note with considerable interest an article which appeared in a recent issue of The Missouri Farmer concerning a new breed of horses to be known as "wagon horses."

The esablishment of a new breed of live stock is a long and somewhat uncertain task. Not many years ago the United States Government established a foundation for a breed of American carriage horses. This work has been progressing for 10 to 15 years and no results have as yet been made public.

The Government cooperating with the Iowa College purchased foundation stock for a new breed of draft horses. We have not as yet seen the results from this work.

The idea suggested in the statement concerning the new breed is to establish them from Percheron horses. The type of horse produced will be a type known as the wagon horse, I take it. There is no doubt but that there is a great demand for this type of horse but as yet it is being supplied in sufficient quantities from grade draft horses that are produced or from the well grown standard horses. When ever any effort is made to establish a new breed of horses it is my opinion that care should be taken to see that there is a real need for such a breed. Understand that I do not question the need of this type of horse but I question whether or not it cannot be secured equally as well without the establishment of a new breed.—E. A. Trowbridge, University of Missouri.

Discussion of the Missouri Land Bank

By Geo. B. Ellis, Managing Editor

The steady rise in price of farm lands forces the man who would own a farm to find more capital than he would have needed at any time in our history. The Department of Agriculture estimates the average increase in the value of farm lands in this country for the last year has been nearly $5 an acre. It would then require about $800 more capital to buy a quarter-section farm now than it would twelve months ago.

It is a generally accepted theory that a country is much safer with a citizenry of home owners than it would be with the land owned by a few rich land lords and the homes occupied by tenants. But in spite of these undisputed facts the number of tenants is increasing in this country more rapidly than the number of home owners and as the country grows older, the land higher in value and lower in productiveness, this condition will inevitably grow worse unless something is done to arrest it.

What Other Countries Have Done

The questions now confronting this country with reference to land ownership are not new to the world but they are the same questions that have concerned the greatest statesmen of all the countries of the old world and why should not we profit by their experience? If Great Britain, Germany, Austria-Hungary, France, Denmark, Italy, Australia and other less important countries of Europe have found a way to help and encourage the people to own their homes and the land they till why should not we profit by their experience? It took a revolution to bring about the change in France. It took riots, extreme poverty and threatened revolution to arouse Great Britain to the necessity for relief in Ireland. In Germany where a system of cooperative rural credits has been in successful operation for more than 100 years the rulers were wise enough to see the value it would be to the farmers as well as to the nation itself and without waiting for necessity to drive them to it put their land banks in operation voluntarily. Now that we see the land gradually drifting into the hands of a few and thousands of the tillers of the soil reduced to peasantry shall we sit still and do nothing or shall we arouse ourselves to the danger of the future and lend our voice, vote and influence to prevent it?

National Rural Credits

The United States Congress now has a bill before it which if passed will provide for the organization of land banks in every state through which farmers may obtain long time loans at a reasonable rate of interest. The organization of these banks will be slow and it will be many years before they could possibly provide money enough to take up the billions of dollars now invested in land mortgages in the United States and so we think it is an intelligent move for the states to take up the organization of state land banks. The Federal Government long ago provided for a system of national banks but the individual states have also provided for a system of state banks and trust companies and these have proved their worth to the commercial needs of the country.

Missouri Leads Other States

Missouri was among the first of the states to pass a land bank Act. The Legislature in session in 1915 enacted what is known as the Gardner Land Bank Act, so-called from the author of the bill, Colonel Fred D. Gardner, a large farmer and manufacturer who had made a study of the question and who had from personal experience learned that a manufacturer, business man or banker could borrow money at a much lower rate of interest than the farmer could while as a matter of fact the farmers' profits were usually smaller than the other lines of business were. Before the Gardner Land Bank Bill was introduced in the Legislature The Missouri Farmer published a tentative draft of the measure in the January 1, 1915, issue, and since that time we have constantly kept this plan before our readers, but to answer the new inquiries which come to us in most every mail we will again outline what the Gardner Land Bank Act is and what it proposes to do.

The Missouri Land Bank is incorporated by the Legislature to provide the means "whereby loans may be made to tillers of the soil at the least practicable cost to them, * * * and provide suitable guarantees against loss."

How the Bank Is Governed

The Land Bank is to be governed by a board composed of the Governor, Attorney General, Secretary of State, State Treasurer and State Auditor. These members give the time necessary to the government of the bank without pay as they are already on state salary. The office of the bank is to be in the State Capitol, another expense saving as there will be no rents to pay. The manager of the bank is to be the State Bank Commissioner and only the extra clerks and employes needed to transact the business of making loans will be paid for out of the funds of the bank.

The bank will have power to make loans on farm lands up to fifty per cent of the value of the land, the loans to run for periods not less than 5 nor more than 25 years and every loan is to be secured by a deed of trust on the land. No loan can be made for a less amount than $250 nor for more than $10,000. The law declares that the policy of the act shall be to improve and develop the largest number of farms and therefore preference shall always be given to loans of less than $5,000. The act further provides that "in no case shall loans be made for speculation or otherwise than for the following purposes:

(a) To increase the production of the land mortgaged.

(b) To make useful improvements thereon.

(c) To pay off liens or incumbrances, or to make part payment of purchase price where the borrower is paying part of the purchase money.

(d) Twenty-five (25%) of the amount lent may be used for the purchase of stock and machinery." These wise provisions are a complete refutation to the argument that the Land Bank will encourage speculation in land values. The governing board can refuse to make any loan where the evidence is not sufficient to show that the money will be used as provided above.

While the loans are made in five-year periods from 5 to 25 years the borrower may pay any part or all of his loan after it runs five years but he can pay only at the time the interest is due. That is, if the interest is payable, say, April 1 and October 1, the borrower could make payment of any amount he desires but the payment can not be made on any other date. The board can have the interest paid annually or semi-annually as they provide and in addition to the interest payment the borrower must pay a partial payment on the principal so that the whole debt is paid off within the time the loan is made to run.

The working capital of the bank is provided by a loan of one million dollars to be appropriated by the General Assembly out of the moneys of the state treasury. This is a loan, not a gift and provision is made for repayment to the state whenever the resources of the bank are sufficient. As soon as the first $500,000 is loaned the bank shall have power to sell debenture bonds for that amount and after that the bank may sell other series of bonds as often as in the judgment of the managers there shall be on hand notes and deeds of trust of an amount sufficiently large to make a series.

A Saving to Borrowers

The first series of loans will be made at 4.3 per cent interest, plus one half of one per cent for reserve and expenses, plus 1.7 per cent to apply on the principal. The farmer who gets a loan under this plan for $1,000 will pay on it as follows:

5 years, payable annually	$22
10 years, payable annually	12
15 years, payable annually	9
20 years, payable annually	7
52 years, payable annually	6

The above payments pay off the principal and interest in the time stated. On a thousand dollar loan for five years the borrower will pay five payments of $224 or a total of $1,120. If he had borrowed the money at 6 per cent interest he would have paid $60 annually for 5 years or $300 in interest and still owe the $1,000, or a total of $1,300. In other words by paying a small payment each year he saves $180 in interest or we may say his yearly payment earns him the $180. If the loan is for 25 years his yearly payment is only $65 and 25 payments amounting to $1,625 when the debt is paid. At 6 per cent simple interest he would pay out $60 a year amounting to $1,500 in 25 years and he would yet owe the $1,000. This would make his total payments $2,500 which under the land bank plan it would be only $1,625. In other words the borrower would save $875 in the whole time because of his ability to pay a small amount on his loan each year.

Expenses of Administration Are Low

In all organizations making farm loans there must be some one to examine the land and appraise its value else loans might be granted for more than the land was worth. Under this plan the manager will appoint as many appraisers as are necessary on an annual salary of $2,000 and expenses. The land shall be appraised at its cash value. The borrower must furnish an abstract of title and this must be examined by the Prosecuting Attorney and he reports as to the validity of the title and then it is passed on by the Attorney General. The manager may require any county officer or any bank or trust company located in the county of the applicant's residence to give without charge any information desired about the applicant or his land.

While the Land Bank is well protected against loss the expenses of making loans are kept down to the lowest limit and whatever expenses

here may be will be paid out of the ne-half of one per cent which is harged to create an expense and reerve fund. Provision is made for oreclosure for non-payment of debt nd the bank has authority to buy the and if necessary to protect it from oss.

The Price of Bonds Will Fix the Interest Rate

The Land Bank may loan $40,000,000 n the working capital and further isues of $30 for every $1 in the net anual reserve. Possibly $50,000,000 ay then be placed in loans without n increase of capital. In order to ake the bonds sell readily they are xempt from state, county and munipal taxation. The rate at which the onds can be sold will fix the rate of nterest charged borrowers, and if we re to furnish farmers a lower rate f interest it is necessary to exempt hese bonds so that any of our own eople having money to invest may uy them. This provision is being atacked by the enemies of rural credit egislation but when we take into account the fact that the land is assessed or taxes there is no good reason why e should tax it twice by assessing he loans on the land. People who live n towns where the tax rate is from ½ to 3½ would not buy bonds drawng only 4.3 per cent when they would ave to pay more than one-half their nterest in taxes.

The two important things the Misouri Land Bank will do for the farmrs of the state are, first, to furnish hem loans at a lower rate of interest hich most men who have been trying o pay off a mortgage will tell you is eeded and, second, to provide long ime with provision for making small ayment each year and the option of aying the entire amount at any interst paying period after the first five ears. No man who is sincerely inerested in the farmers' welfare can onsistently oppose this measure beause if it proves deficient in any paricular provision the Legislature will ave full power to change and improve t in any manner to suit the best inerests of the state.

The above sets out the essential feaures of the Missouri Land Bank Law s passed by the last Legislature but hich requires a Constitutional Amendment before it can become perative. The amednment will be ubmitted at the general election this all. The Missouri Farmer will be lad to answer any question about the neasure our readers may ask.

SUDAN GRASS HOG PASTURE

It certainly seems rather strange or any one to even think of Sudan Grass for pasturing any kind of an nimal, as it is a sorghum and can not be pastured but about four months t best as it is will not do any good ntil the weather gets warm and the irst frost stops all growth, if there was nothing else available, then one ould be excused, but with the long ist of annuals such as Rape, Copeas, Soybeans, Oats, Canada field peas, Vetch, why talk Sudan? Better still prepare a permanent pasture of Alfalfa. Orchard grass and clover, or clover alone. Orchard grass makes perhaps the best pasture, it is above all, permanent, lasts indefinitely and if clover is sown on it, say every two or three years, or as may be need, it is better then anything else known, it produces better that way. Sudan is a great producer, it makes a large pile. If quantity is desired and quality not considered go at it, but it is a coarse, rough feed, of little value and being a Sorghum, very exhaustive on the soil, but on the other hand the legumes are soil builders and when pastured actually leave the ground in better condition then they found it. Why not build up, improve and better conditions as we go along?—Simon Baumgartner.

WHY NOT BREED REGISTERED CATTLE?

When it is considered that the use of purebred sires has raised the standard of merit wherever it has been introduced, it seems rather inconsistent that registered stock are not more generally bred and in larger numbers. If all of the registered animals of the Shorthorn breed, this being the strongest bovine breed in point of numbers in America, and admittedly the best adapted to farm conditions in all parts of the country, were placed within a state of average size, there would not be nearly enough animals to stock one-half of the farms within its borders.

That pure blood is potent and works improvement, there is none to deny, and in view of this, a more general production of registered animals will not only raise the standard of merit, but will prove a profitable undertaking. I have often heard this reply from men when appeaeld to in public auctions of registered cattle, to make an investment, "Oh, I am not a full-blood man", meaning that they regarded it as a business distinct from the production of un-registered cattle. This prevailing impression is unfortunate; because of it, many men have refrained from taking advantage of the larger profits which the breeding of registered cattle offers.

If the average man will make selections of breeding stock, adhering to the type which he holds in favor, he will realize larger profits and an increased interest in the business over the breeding and handling of grade stock. The keeping of records involves but little time and is in no sense complicated. It requires merely making a notation of the birth date, of the calves, crediting them to the proper parentage, giving them a name and sending them for record in accordance with the simple rules of the pedigree associations. If the owner does not wish to sell the male calves for breeding purposes, they may be sent to the feed lot. Yet in seven years out of ten, they will pay larger profits if sold for breeding purposes. The prevailing practice among experienced breeders is to consign the least promising ones to the feed lot, a plan that works for the improvement of the breed.

There is no longer any doubt as to the superior merit, for practical purposes, of registered stock. Cattle are no longer grown to be subjected to trying conditions of endurance. They are grown to meet the market requirements and the better they are fed and cared for, the earlier they are matured, the more certain the profits for the producer. It is under this treatment that the registered animal, the well-bred animal, responds better than the grade carrying a varying percentage of inferior blood. This isn't a theory. It is an established fact that has been widely demonstrated that there is no longer any question as to its reliability.

If there is a reader of this paper who clings to grade cattle on the assumption that full-blood cattle are not adapted to his purpose or that there is something professional in their production, he will do well to modify his views to conform to the accepted experience of the present day. Comparatively few men will rely wholly upon the patronage of breeders of registered cattle to take their output for breeding purposes, but a large majority will find it profitable to grow registered or full-blood cattle for market purposes. The practice will insure increased profits to any intelligent man who follows it. It requires good judgment, intelligent care and liberal feeding, and what successful stockman can proceed on any other basis. The subject merits thoughtful consideration.

Make Every Minute Count

International Cultivators

ARE you farming large fields of corn? Is labor scarce? Do you have to pay high wages for it? Do you ever have backward seasons when every minute of good cultivating weather is precious?

If you have any of these conditions you need an **International two-row cultivator.** With it, one man can do as much work as two without it, and in half the time.

The two-row cultivator has the **International** parallel gang movement which, once familiar to a corn grower, always sends him back for an **International** when be buys a cultivator. Each gang has a separate adjustment for depth. Each gang, or each pair of gangs, can be raised or lowered independently. The clearance space is unusually high, because the strong U-section steel frame needs no truss. You change your arch widths without using a wrench.

The full line of **International cultivators** includes walking, combination, side-hill, and riding one-row cultivators, besides the two-row described above. Ask your local dealer to show you these cultivators, or write us for catalogues and complete information. Do not buy a cultivator almost as good when you can get the best. Write us to the address below.

A COLLEGE FRIEND

The Missouri Farmer:
Am ashamed to find my subscription is behind. Presume my zeal to see the inside of the issue blinded me for the outside. Cordially,
Lowell M. McAfee,
Parson College, Fairfield, Iowa.

What Our Readers Say

Elwood Williams, Ash Grove, Mo.: "Somebody has been sending me your paper but now I am going to "come clean" by sending you a dollar. Your cry for justice for the farmer carried out is our only hope—or we perish and nothing but a French Revolution will right it if it is permitted to go much longer. I am going to try to get our district to organize."

C. R. Hastings, Luray, Mo.: "If Judge Bedford's figures were right in his recent fine article. I lost $420 last year. Am with you with at least a $20 bill for a farmer's packing plant.

W. E. Harvey, Randolph County: "We have organized a Farm Club in my district with 20 members but sickness and bad weather is interfering with us. As soon as these conditions change I think we will have fine interest in our Club."

John I. Conrad, Madison County: "We organized a Farm Club with 14 members the other night and expect to enroll 6 or 8 more at the next meeting. Please send me a lot more literature as several neighboring districts are about ready to organize."

Wm. A. Faulk, Carroll County: "Our township Farm Club meets next Tuesday. We have been having a fine attendance—from 25 to 125. We will take up the Land Bank Bill at our next meeting."

GET THE GRAIN IN THE SACK

That's Why You Thresh

Some makers of threshing machinery get so interested in getting the straw out again after it gets into their separator that they forget where the grain belongs and run it right along with the straw.

Their stackers work fine, but their cash register gets terribly out of kilter and generally rings up, "Paid Out."

The Red River Special

ALWAYS LOOKS OUT FOR THE CASH

It makes money for owner or user because its builders are interested in getting all of the grain there is in the crop. They don't forget that the cash register attachment is connected at the *sacker*, not the *stacker*.

You'll find it right there where they put it if you buy or hire a Nichols-Shepard machine this season.

Why not Get the Big Run?

If you are influenced by good neighborly opinion, you'll find a lot of it concerning Red River Special methods in the Home Edition of a lively little paper that tells considerable about profitable threshing. We'd be glad to send you the latest number. Don't forget to request a Big Catalog when you write for the paper.

FORAGE CROPS FOR THE PIGS

There are several very important reasons why the growing pigs should be provided with a succession of green, succulent material during the summer. I would enumerate the following as the principal advantages gained by the growing of forage crops for pork production.

In the first place the pigs will make more rapid gains. With high-priced land and feed rapid gains are becoming more and more important as a factor in the profitable production of meat on the farm. Rapid gains are necessary for cheap gains. The faster the pigs gain, also, the earlier they may be marketed; and, as a rule, the earlier the market the better the market. As a rule, hogs sell at the highest of the year during September. This is because, on the average, the supply of hogs is lowest during this month. Taking it one year with another, the price of hogs falls from September on to the middle of the winter, at which time the supply is greatest. The man who produces early pigs, who supplies a desirable succession of forage crops during the summer, is in a position, therefore, to market early and consequently profit by a higher selling price. The consensus of all experimental feeding tests, and the experience of farmers, would indicate that we may expect fifty per cent faster gains with pigs on good forage as compared with the dry lot method.

Pigs getting a good forage crop will make cheaper gains than those confined to the dry lot. The saving of corn required to produce 100 pounds of gain is considerable. Experimental tests have demonstrated that the cost in dollars and cents is reduced from 20 to 50 per cent. In some tests the pork gotten from a bushel of corn has been doubled. Of course the forage crops cost something in land and labor; but when we consider that the crop may be one which is regularly grown in the rotation, or has been grown on odd lots about the barn which were in need of renovating, this item is not so important.

The third reason I would emphasize is one of the most important, viz., that by the growing of forage crops the hog man is enabled to cut down on the purchase of such feeds as shorts, tankage, oil meal, etc. The use of a considerable proportion of some one of these supplemental feeds is necessary to get satisfactory returns in dry-lot feeding. With green crops only a very small portion of these feeds is needed, especially if the crop used is a legume. One of the reasons why the gains made are cheaper is because it enables the more exclusive use of corn in the growing and fattening ration.

Then again, green, succulent feed during the summer promotes thrift. Thrift is an evidence of good health and is expressed in vigorous growth and rapid development. The reasonable amount of exercise which is promoted by access to a forage crop contributes its share to this thrift. Lots which have been plowed are clean and sanitary. Pigs on such soil, in contact with good earth, have their chances for escaping disease infinitely improved.

The growing of leguminous forage crops improves the fertility of the soil. By allowing the pigs to eat one-half or two-thirds of a crop like clover or alfalfa, they will return to the soil approximately 75 per cent of the fertility of the feed eaten. The Farm Crops Department of Purdue in a test determined that an acre of soy beans planted in July after the wheat grown on the same land had been harvested, resulted in adding ten dollars worth of fertility to the soil. By allowing the pigs to eat a crop like this, instead of plowing it under, they will remove no more than twenty to twenty-five per eent of the fertility of the feed eaten, and in addition will produce in pork a value more than equivalent to the full fertility value of the crop. In this way a farmer can get a double value from such a crop, one in fertility and one in feed.

Special forage crops which are valuable under most Indiana condtions for early spring and summer are the following: rape, rape and oats, Canada field peas and oats, fall sown rye. Rape is an extremely reliable and valuable crop, especially for the northern parts of the state. It may be sown anytime during the summer and, with timely rains, will supply an abundance of tender, succulent feed which pigs greatly relish. For late summer and full use chief dependence should ordinarily be placed in cow peas and soy beans, the latter being especially valuable late in the fall as a supplement to corn that is being "hogged down."

As a general practice, clover which is regularly grown in the rotation should be more generally used for forage purposes. It is probable that the largest return in both feed and fertility is gotten from this crop by careful pasturing with hogs. Alfalfa is a wonderful pig forage crop. It is doubtful if any system of handling this crop will equal in profit that gotten by allowing the pigs one-third or one-half the field. Both clover and alfalfa may be injured by overstocking, and care should be exercised that the pigs be kept off when the young shoots are starting.

The accompanying table published in Circular No. 35 of this Station, "Supplementary Pasture Crops," by Fisher and King, will be found valuable in its suggestions.

The need of feeding some supplemental feed like tankage, shorts, or oil meal along with the corn to pigs having access to green forage, is determined largely by the afe of the pigs and the character of the forage. Pigs under 100 pounds when on rye, blue grass, timothy, rape, or peas and oats, need to have some protein fed with the corn. From ten to twelve parts of corn to one of 60 per cent tankage, by weight, will make a good ration. If the pasture is good clover or alfalfa, 15 parts of corn to 1 of tankage will be about right for pigs under 100 pounds in weight. With pigs weighing more than 100 pounds it is very doubtful if it is a matter of economy to buy and feed any supplement at all. With mature soy beans or cow peas straight corn is all that is ever needed.

A very satisfactory method of feeding pigs which it is intended to push rapidly and market early, is by the self-feeder method. The experimental results gotten with the self-feeder and the "free-choice" method, at the Iowa Experiment Station, would recommend the system highly when it is the desire to full feed for largest gains. The experience which we have had with this method at Purdue would indicate its practicability and safety when feeding corn and tankage. Last summer thirty spring pigs on an acre of excellent rape had access to shelled corn and tankage in self feeders. They could eat all the corn or tankage they wanted at any time. The corn and tankage were fed in separate places. They ate only one part of tankage to 18 parts of corn, which indicated that, with these feeds at least, the pig is capable of balancing his own ration. These were just average pigs, but they made a gain of more than a pound each daily, and required only 3.4 pounds of feed (corn and tankage) to produce 1 pound of gain.

—W. W. Smith, Indiana Experiment Station, Purdue Agriculturist.

Pasture for Hogs by Months
By Fisher and King, Indiana Experiment Station

Month	Name of Crop	Date of Sowing	Approximate length of time crop affords pasture	No. of 100-lb. hogs per acre
April	Rye	Aug. or Sept.	Six weeks	10-15
May	Oats	Mar. 20-Apr. 10	Six weeks	8-12
	Oats and rape	Mar. 20-Apr. 10	Four weeks	12-20
	Oats and Ca. field peas	Mar. 20-Apr. 10	Four weeks	12-20
	Rape	Apr. 1-10	Four weeks	12-15
June	Rape and oats	Apr. 10-30	Four weeks	15-20
	Ca. field peas and oats	Apr. 10-30	Four weeks	12-15
	Rape	Apr. 10-30	Four weeks	12-20
July	Rape	Apr. 1-10 Grazed down in May	Four weeks	12-20
	Rape	May 1-20	Four weeks	12-20
	Clover—Red or Mammoth	Mar. 25-Apr. 10 without nurse crop	Balance of season	8-10
	Sorghum	May 10-20	Four weeks	15-20
August	Clover—Red or Mammoth	Spring sown	Balance of season	8-10
	Rape	Apr. 10-30, and grazed down in June	Four weeks	12-20
	Rape	June 10-15	Four weeks	12-20
	Sorghum	May 20-30	Four weeks	15-20
	Soy beans or cow peas	May 20-June 1	Six weeks	12-18
September	Clover—Red or Mammoth	Spring sown	Balance of season	8-10
	Soy beans or cow peas	Mar. 20-June 15	Six weeks	12-18
	Rape	Second or third growth	Four weeks	12-20
	Rape	June 20-July 10	Four weeks	12-20
	Pumpkins	May 15-June 15	Fed in lots	
	Sorghum	May 20-June 15	Fed in lots	
October	Clover—Red or Mammoth	Spring sown	Balance of season	8-10
	Rape	Same as Sept.	Four weeks	12-20
	Rye	Aug. 1-30	Balance of season	8-10
	Soy beans or cow peas	June 1-July 15	Four weeks	12-20

THE CONTROL OF CUTWORMS

There is more or less damage done to garden and field crops every year from cutworms. The crop which suffers most from these insects is corn and with proper management much of this loss can be prevented. Moths often called "millers" are the parents of the cutworms and because these moths lay their eggs on vegetation particularly in grass fields a sod field planted to corn is likely to suffer more damage than others fields. If the sod land can be plowed in late summer or early fall the eggs will be destroyed and much of the usual damage will be saved. When the land is not plowed until spring if corn planting can be delayed a while and the sod land worked several times at intervals many of the worms will be destroyed and at the same time a good seed bed will be made.

We do not think anything is gained by hurrying the planting on sod land. It takes some time to work a sod down and the better the sod is rotted by the time the corn is well started the more available fertility it will have to push it along.

Cutworms do most of their work at night and in the cool of the morning and after the days get hot they usually do little more damage. When the field is fenced hog tight pasturing with hogs the season previous to cultivation will get rid of a lot of the worms.

The Department of Agriculture recommends the following method for poisoning cutworms, which has been very successfully used in a great many instances:

When cutworms are found to be abundant on corn land, the use of the poisoned bait is recommended. This may be prepared as follows: Mix 50 pounds of wheat bran, 2 pounds of Paris green, and 6 finely chopped oranges or lemons. Then bring the whole mixture to the consistency of a stiff dough by the addition of a cheap molasses, such as is used in cattle rations, adding water when necessary. Distribute this bait over the infested

fid in small lumps, taking care to sinkle it sparingly around each hill. I case bran can not be readily obtned, middlings or alfalfa meal may b successfully substituted. In fields kown to be infested, the distribution c this bait should be started as soon a the corn begins to appear above t ground so that the cutworms may b eliminated as quickly as possible a l the injured hills promptly rented. During the warmer spring nths cutworms do most of their fding at night and burrow into the sl to the depth of an inch or two cring the day, so that the bait will nally be more effective if applied cring the late afternoon or early evenig hours.

Frequently cutworms migrate to culated fields from adjoining grassnd, and in such cases the crops can protected by running a narrow band the poisoned bait around the edge the field or along the side nearest source of infestation.

EDING FOR MILK PRODUCTION

That the Shorthorn cow has been a eat factor in the development of daing in the Corn belt goes without ying and this need not be said in e disparagement of any other breed. any men will select one of the typil dairy breeds and succeed with it hile on the other hand thousands of rmers who keep only a few cows d who want to raise the calves will ick to the Shorthorns.

From the initial number of The horthorn in America we reproduce e following from the pen of J. A. cLean:

The beef making capacity of the horthorn has been amply developed. he breed possesses beauty of form, nstitution, capacity for food, wealth natural flesh, and aptitude to fatten a full degree. It is distinguished its combined scale and quality. here was a time when another addional feature characterized this breed, z: excellence in milk production. nfortunately this trait has been for e last forty years neglected in most our breeding work.

Both Flesh and Milk

By proper methods in care, handling nd development, this valuable charcter must be restored. But its restortion must not be achieved at the loss f any of the other valuable features f the breed. While practically all e instruction in this country has een along the lines of special-purose breeds and has rated beef making s antagonistic to milk giving, yet I now of no investigational work which roves that the animal which carries wealth of natural flesh cannot also arry an excellent udder, or that the unction of high milk production is exlusively tied to a flat-ribbed, thinoined, muscleless, thighless cow. Nor an I see why a wealth of natural flesh hould prevent under-development and nilk-giving. In your constructional evelopment of your breed you have he opportunity of leading the leaders n this respect.

Nothing will be of greater value to he average farmer nor to you as breeders than will the keeping of acurate milk records continuously year fter year. Prove to yourselves and o the world that your two-year-olds nd your aged cows alike do produce nuch milk and butter fat. To no other breed is there so universally a kindly eeling or so much sentiment—but the nilkman must have milk. And as you levelop the milk production, never fail o show your cows, your bulls and your fat steers to maintain and demonstrate your type.

Feeding for milk production will become more and more a vital problem in the management of your herds; consequently a few of the things which the specialized dairymen has learned may be followed with safety.

In addition to furnishing the necssary nutriments there are other requisites which we must carefully regard if we would feed successfully. Besides furnishing the food elements, a ration must be bulky, succulent, palatable, digestable and varied.

Bulk is obtained very largely in the hays and silage, but in the feeding of hays, if care is taken in their selection, a large part of the necessary nourishment may be supplied at the same time.

Succulence in Silage and Roots

For greatest and most economic milk production some succulent feed must be furnished the cow. For this purpose few feeds are moe satisfactory than silage, when all factors are considered. It is particularly valuable for winter feeding and no dairyman carrying more than ten cows can easily succeed without a silo. Roots are an excellent substitute for silage and are rather more productive of milk. Cows will eat a larger quantity of roots apparently, because they have a higher palatability. During the summer season this element of succulence is abundantly supplied in the pasture grasses. However, against those periods of the summer when grass is short and dry, it is certainly good practice to have either silage or some green feed to supply the cow's needs.

It seems scarcely necessary to elaborate upon the factor of palatability. Cows will eat more feed and will digest more thoroughly when feeds are supplied that appeal to the appetite. This is one reason why timothy hay is not a good milk producer. By analysis it rates well, but it does not appeal to the cow, neither is it easily digested. It is one of the poorest sources of roughage which we have, and no herd of dairy cows can be fed upon it, be charged market values for it and show any considerable profit.

Alfalfa and Clover Valuable

Regarding the sources of these essentials, I shall not take time more than to emphasize the home-growing of proteins in the form of alfalfa and clover. If a man will supply all his hay to his dairy in the form of either one of these hays he can practically eliminate entirely the purchasing of any high-proteid concentrate. At the same time in the growing of these hays the fertility and conditon of the soil will constantly be improved. One can to greater advantage afford to buy carbo-hydrates.

I would emphasize the studying of your individual cows. Some have a very much greater capacity for milk production than have others. It is essential that you feed all up to their capacity in order that you may be able to eliminate the low producers. The only way we could ever have made trotting horses in this country was by taking them out on the track and trotting them to their limit of speed. We killed some, we crippled a great many, but we discovered those that had not only the speed but the vitality and endurance which was necessary, and from these we bred still others with greater speed. Similarly we will increase the milk production of our Shorthorns; we must develop that function to its fullest, thereby discovering the highest producers, and from these breeding still better.

Remember that only the cows that have a large feed bill, have a chance of showing their owner a profit; cows that have not the capacity to take a lot of food and turn it into milk, are not profitable cows from a milk production standpoint. We lose money in our dairy herds by the excessive feeding of the poor cows and frequently by the underfeeding of the good ones. If milk production pays we must study the individual, breed only from the best and pass the low producers to the butcher.

THE FEED COST OF KEEPING BEEF CATTLE

Investigations carreid on with beef cattle at the Missouri Agricultural Experiment Station during the past nine years have shown that the amount of feed necessary to keep beef steers at constant body weight will vary with different condiions. The ration consisted of two and a half pounds of grain to one pound of choice alfalfa hay. The grain was composed of eight parts of corn chop to one part of old process linseed meal.

One 11 months old steer weighing 607 pounds needed 4.7 pounds of grain and 1.9 pounds of hay daily to keep at constant weight during one year. A second animal of the same age weighing 736 pounds needed 5.6 pounds of grain and 2¼ pounds of hay daily during one-half year. A two year old steer weighing 767 pounds kept at constant weight for one year on an average daily feed of 5¾ pounds of grain and 2½ pounds of hay. Another steer of the same age weighing eight pounds less needed daily 6.1 pounds of grain and 2.7 pounds of hay to maintain body weight. This steer was quite active. A three year old steer weighing 837 pounds needed 6.8 pounds of grain and about 3 pounds of hay daily during five months. Two other steers one year old, the first weighing 934 pounds and the second weighing 1081 pounds, needed only 6½ pounds of grain and 22-3 pounds of hay daily during 2 years. A two year old steer weighing 1212 pounds was kept at constant weight for four years on the same daily weight of grain and hay as used by the last two steers. Another steer weiging 1065 pounds was kept for over two years at constant weight with a daily ration of 6.1 pounds of grain and 2½ pounds of hay. This last animal was kept confined in a stall while the others had the run of a small lot. The last three steers were very fat at the beginning.

The results when studied with reference to the varying conditions show:

1. The cost is proportional to the amount of active protein (lean muscle and organs) in the steer and not to live weigth.
2. It costs less to keep eight 1200 pound steers than to keep twelve 800 pounds steers.
3. The season influences the cost. It is highest in the winter and in very hot weather.
4. Previous high living greatly increases the cost.
5. Youth and activity increase cost.
6. Age and inactivity increase cost.
7. A long time on maintenance decreases the cost.
8. Fatness may decrease the cost since the steer can save feed by using body fat.
9. Thrifty steers need less feed than poor feeders and those lacking in thrift.

C. R. Moulton,
Missouri College of Agriculture.

For Greatest Satisfaction Use
DOUBLE SERVICE Automobile Tires
Guaranteed 7,000 Miles Service
Absolutely Punctureproof
Double Service Tires are made double the thickness of the best standard make tires.
This 100% greater wearing surface naturally gives that much more mileage and service. The average of 12 miles of tough fabric and one inch surface tread rubber makes these tires *absolutely punctureproof*.
These tires excel all others for use in the country over rough and rugged roads as well as on hard pavements. They are as easy riding and resilient as any other pneumatic tire—the air space and pressure being the same.
They are the *most economical* and "care free" tires made and are used where tires must be depended on and tire troubles cannot be tolerated. Many *Double Service* style tires are in use in the U. S. government and European War service.
Our output is limited to a certain amount, but for a short time we offer the following reduced special prices as an Introductory Offer:
PRICES

	Tires	Tubes		Tires	Tubes
30x3 in.	$ 8.60	$2.30	36x4 in.	$17.45	$4.55
30x3½ in.	10.85	3.10	35x4½ in.	21.20	5.60
32x3½ in.	12.75	3.20	36x4½ in.	22.50	5.75
33x4 in.	15.75	4.20	37x4½ in.	23.60	6.20
34x4 in.	16.70	4.35	37x5 in.	26.30	6.60

All other sizes not included in above list also furnished. Non-skids at 10% additional.
Terms: Payment with order at above especial prices, a 10% discount allowed on orders for two or more tires. All personal checks must be certified.
Try these tires now and be convinced of their very high qualities. Sold direct to the consumer only.
Descriptive folder upon request. Write for it.

GALLOWAY

ENGINES
SEPARATORS, SPREADERS, TRACTORS

My 250-page free catalog tells you why I sell direct to user, at wholesale, these and other implements, built in my own factories at Waterloo, at prices one-third to one-half LESS than you usually pay for first-class goods. All sizes, styles and prices of separators, engines and spreaders. My Farmobile (tractor) has no equal for simplicity and efficiency. State what you need. 250,000 customers testify to quality of the Galloway line of goods. Write today for your free copy of this wonderful book of bargains for farm and household.
WM. GALLOWAY, Pres.
WM. GALLOWAY CO.
597 Galloway Station
Waterloo, Iowa.
$34.50
Spreaders $64.75 up
$995
Engines $26.75 up

Self-Draining LOCK
Won't Hold Moisture
Compare the Square Deal Lock with all others and you will see why it is the favorite with discriminating farmers everywhere. It double grips the stay and strand wires without cutting, breaking or slipping. Looks neatest, holds firmest, and lasts longest.
SQUARE DEAL FENCE
has one-piece stay wires that prevent sagging, bagging and buckling; also wavy strand wires that give springiness, elasticity, life. Heavy 99 3-4% pure galvanizing.
FREE To Landowners Only. Ropp's New Calculator—a 160 page book (worth 50c) answers almost any problem on the farm. Sent free with Square Deal Fence Catalog.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VIII April 15, 1916 No. 8

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the potoffice at Columbia, Missouri, as second-class mail matter.

THE FARMERS' GARDEN

Have our readers not all noticed the difference between farm gardens? A well planned garden of vegetables and small fruits will supply more than half the needs of the table throughout the year besides promoting the health of the family and saving a lot of expense for things often bought at the store. Some farmers think the time spent on a garden can be more profitably used in the field but they fail to place the proper value on both the pleasure and the healthfulness of having a constant supply of fresh fruits and vegetables at all times. Many city homes are better supplied with fruits and vegetables than some country homes are but the poorest home with only one-acre of land available for a garden can have the finest the land affords.

Fresh, crisp vegetables and rich, ripe fruits promote health, happiness and prosperity.

A GREAT WASTE

The spring rains call to mind the greatest of all farm wastes, that of soil washing. One day's rain may wash gullies which will require years of careful planning to fill an on very rolling land it may be impossible to ever repair the damage.

We talk a great deal about the enormous loss of fertility from taking off the crops but the annual loss from soil washing on rolling lands is much greater. Then by feeding the crops to live stock we can put most of the fertility back on the land and in a readily available form but the washed away soil is gone forever.

We hear a lot of talk by irresponsible people about plowing more land, raising more grain and clearing up the forests but those who have studied this matter carefully generally agree that we have already cleared the timber off thousands of acres that ought to have remained in forest. The best we can do with these lands now that they are cleared is to seed them down to some tenacious pasture grass and quit plowing them.

Where the land is naturally poor or well worn by long and continuous cultivation it will cost something in time, labor and money to get a good stand of grass on such land but every year we put off the reclamation the greater will be the cost. A little lower annual income from a pasture crop may in the end be most profitable.

THE COST OF DIRT ROADS

A great deal is said every year about the cost of repairing earth roads and the lack of any permanency about it but we do not see any way around the difficulty until we wake up to the necessity of putting our road work into the hands of men who will give their whole time to it. Then we must take enough interest in our roads that we will elect or have appointed honest capable men to office.

The Citizen published in Kansas City, Missouri, in the March issue gives record figures which show that approximately one thousand miles of earth roads in Jackson County cost $106.,445.00 for up keep last year. This is more than $100 per mile for the year. Had there been any extensive program of grading, drainage or of concrete culverts this amount might not be extravagant but it seems nothing of this kind was in progess. The above does not include any of the expense of the County Highway Engineer which department cost Jackson County more than $28,000 last year.

While not many counties are so poorly governed as is Jackson there is plenty of room for improvement in the management and cost of maintaining the roads, either earth or hard surface. A lot of repair work must be done on any road and some of this at times must be done hurriedly and temporarily but if we can get in the way of doing the road work well we will save a lot of the cost in the end and all the time will have better roads to travel.

It is generally agreed now by road men that the cost of maintaining culverts which is now one of the big items in the upkeep of county roads may be reduced to the minimum by building only concrete structures. When properly built these will last indefinitely and after all necessary culverts are in, the money can be used for draining wet places, making fills or cutting down steep hills. Exclusive of grades, fills, drainage and culverts it should not cost more than $15 or 20 a mile to maintain a good dirt road a year and on a level stretch $10 will be enough to maintain it.

PROGRESS IN ROAD BUILDING

Two Missouri counties have very recently voted bonds for a complete county system of roads. These counties, St. Louis and Jefferson are really suburban territory to the City of St. Louis and there has been a long felt need for better roads so as to develope the truck and dairy business and if the money is efficiently spent it will be a great stimulus to all industries in the counties and a great help to the great city. The amount of bonds to be sold we believe is $3,000,000 in St. Louis County and $1,000,000 in Jefferson and yet a few years ago the people of the whole state, a great many times more wealthy than these two counties, refused to sanction a state road levy of ten cents on the one hundred dollar assessed valuation of property.

There is no reason why Missouri should not go forward in road building if we would just get together and decide on a definite program. Suppose we had a force of trained road workers of say from 100 to 500 men working in every county in the state for the next ten years does any one doubt that it would make a new state out of Missouri? As a money making proposition it would pay in the increased value of land but the greatest profit would be in the better educational advantages that would spring up, the improved social life among country people and what is life worth without these better things any way?

We do not want to make any mistake like New York and Pennsylvania have made and like Jackson County, Missouri, has made and get about 30 cents worth of road and 70 cents of graft for each dollar of tax money, but if every good citizen were alive to this matter, there is no reason why we should not have value received for all we expend.

We would hardly miss the amount of money it would take to pay our share of the taxes for the expenditure of eight or ten million a year for the next ten years and then much of our tax money would come back to us by way of better prices for produce by reason of the employment of so many men.

By far the greatest benefit of a system of good roads for the state would be social and we could afford the cost for that alone, but there are many industrial enterprises that can be developed only with this improvement. With dependable market roads Missouri ought to lead Wisconsin in dairying and California in small fruits.

We would like to have our readers discuss this subject without prejudice in the columns of The Missouri Farmer. Let us have your views.

THE PRIMARY

A little more than three months from now the most important election of the year will be held and every citizen no matter what his political views may be should make himself acquainted with the candidates so that he can cast a vote that will count for something. The Missouri Farmer is not a political paper and never discusses partisan questions in its columns but it is its aim to give all the light it can on economic questions which affect the general welfare of the farmers as a class and of the country as a whole.

While we do not approve of some of the practices of politicians or of political parties we believe that party organization is necessary for the best interests of the county, the state and the nation. The only way to keep these party organizations free from corrupt practices is for every citizen who wants an honest and efficient government to take a part in naming the best men for office and to express himself on the questions at issue in every campaign.

In the election of men to a county or a state office it matters little what the candidates views are on national questions but about ninety-nine out of a hundred vote for the man of his chosen partly rather than for the individual he may think most efficient or who is the best qualified morally for the position.

For the above reasons it is supremely important that we get the best men for candidates in all the parties in the field and then it will make no great difference which party wins the election. The citizen who fails to take part in the primary has no just cause for complaint if bad men are nominated to office.

It is not an easy matter to know the exact truth about the qualification of different candidates for state offices because few of us know the candidates personally but from what they stand for and from watching carefully the company they keep we can usually form a pretty correct estimate of a candidate. One qualification that every man should have who is elected to office is honesty. Unless a man is honest and sincere in his purpose to serve the best interests of the public it matters not how competent he may be otherwise he is not a safe man to nominate.

It is important to choose a man who will fit the office. In selecting a man for Attorney General, for instance, we should try to get an able lawyer, but that kind of training is not at all necessary for the office of Governor. The State Auditor and State Treasurer should be good business men because the former must pass on every account allowed by the state and the Treasurer is the state's banker, but all this talk about needing a business man for Governor is pure nonsense. When we think about the worst mistake the state has made in forty years we think when we nominated and elected a Governor on the grounds of getting a business man. Being a good business man may not be a handicap for a good executive but on the other hand it is not at all an essential qualification

In getting our information about candidates for office it is always safe to ignore the petty politician. The man who is seeking some appointment for himself or for a friend is not a safe adviser. In a recent political gathering we noticed the activity of men who held salaried positions paying $1000 to $1500 a year and we knew why they were so interested in "the man." It is not to be expected that a man will ordinarily travel over the state at his own expense to help nominate or elect some one on purely patriotic motives. And so I say it is safe to discredit either the machine man or the hireling when we are making up our choice of candidates. What they say may be true but we should have better evidence before we accept it. You can judge a man, 90 per cent at least, by the company he keeps and by his campaign methods. If you can not approve them better turn him down.

If you are interested in the Land Bank Amendment you should write at once to A. T. Edmonston, Jefferson City for blank petition to circulate in your neighborhood. Any one can secure the fifty names necessary to fill up one petition in a few hours time but the work should not be delayed. Several districts have not yet enough petitions but a few hours work by a few friends of the measure will finish the first step in getting the Land Bank established.

On page 4 of this paper you will find an outline of the Act passed by the last Legislature and if there are other questions our readers do not understand we will be glad to answer them.

APPRECIATES OUR WORK

The Missouri Farmer:

Enclosed find check for $1.00. Please credit my subscription for same. I had intended to write to you some time ago, but someway overlooked it.

I certainly appreciate the good work "The Missouri Farmer" is doing and hope to see it go on and on with the same.

Wishing you well and hope to see you again some day,

Very truly yours,

Simon Baumgartner,
Rose Hill Farm, Lawrence Co.

BARNYARD GOSSIP

If one boy is abused in his rights and privileges it gives the superficial reformer a chance to lecture parents on the way they govern their children, I have no sympathy for the cold hard-hearted parent who would drive his boys to work like he would his oxen under the yoke but on the other hand I think we American fathers and mothers spoil a great many more boys by our leniency and over indulgence than we do by too rigid discipline.

If we would compare the profligacy of the average American with the frugality of the average European we would be compelled to admit that something must be wrong with the way many of us train our boys and particularly so in business matters. The boy who has been made to realize that the only way for him to ever succeed in a business way is to try to make his monthly earnings, whatever they may be, meet his expenses, and have at least a small sum for investment, has the necessary foundation laid for a successful business life.

A few years ago a poor Scotchman emigrated with his family to Missouri and on the way from New York to Columbia he was unfortunate enough to be injured in a railroad wreck. In the course of a few months the railroad company paid him $500 and with that money the Scotchman made the first payment on a little home and today he and his family are happy in the snug little place, all free from debt. The hard life in Scotland where but few people own any land or own their homes had fitted this family for the frugal life they must live in this country for a few years in order that they might have a little garden, a little orchard and a house they could call their own.

What would three out of four Americans have done with that railroad money? Perhaps they would have bought an automobile, a piano, a horse and phaeton, some swell clothes and continued to live in a rented house.

Here is a story told about how President H. J. Waters of the Kansas Agricultural College values discipline and training in the life of the average boy. President Waters, although the son of a successful Missouri farmer was required to work to support himself while attending the State University and his uninterrupted progress and advancement has proved that what some boys would consider a severe, perhaps intollerable burden, has been a valuable asset. But here is the story as told by President Waters himself:

At the opening of the college year, the president of a big Kansas corporation wanted to know "how much money it would take to put a boy through school here."

"I have a nephew who is coming here," he explained, " and don't want him to lack for money. I want him to have all he needs. Now, if you can tell me someone who is responsible and capable, I will leave the money with him and he can pay it over to the boy as needed."

Mr. Waters studied the visitor a minute.

"I am willing to supply him with whatever is needed," the corporation head went on, "and when he gets out I am going to give him a farm. He is a good boy and I want him to get started right."

"Did it ever occur to you that you might lend him the money and then rent him the farm?" asked the president.

It never had.

"Don't you believe a good many boys have been ruined by having all the money they wanted at college? Don't you know that the best college students frequently are those working their way through? I believe that a reasonable amount of debt at the end of a college course not only will have a steadying influence, but will help a boy acquire the saving habit, and that's a mighty valuable and a mighty difficult thing to acquire."

The uncle was convinced that his plan might prove the ruin of his nephew and without any knowledge of what happeend in President Waters' office the young man is now employed as a janitor in the Kansas Agricultural College.

By Old Jim Riley

Talkin' about democratic politicians havin an appetite like a swarm of army worms, I heard of a republican "get together" meeting' the other night at which they was so all fired hungry that they et up the carnations and ferns that had bin used fer table decorations.

Buckshot by The Professor

The bunch down at "Hez" Browns asked me to tell you all that they've been too busy fishing and plowing for corn to discuss politics or religion. But they'll be with us again by the time the next issue comes out.

Perhaps by the time this issue reaches the reader our army will have been withdrawn from Mexico. Altogether its a mighty humiliating mess and I don't know where the blame lies. If we need more troops we ought to be told so plainly. If necessary we can enlist a hundred thousand men in 30 days to do any honorable thing that needs to be done across the Rio Grande.

"SWAT THE FLY" EARLY

But why "swat the fly" in the winter when you fail to see any? Listen!

"I am a big fat mother fly and I live in a large house, tucked away in a crack behind a door casing. The housekeeper has overlooked me. She thinks we are all dead. I have a friend or two in the basement and a cousin in the attic. We have seen each other a few times since winter set in, though we hide away most of the time. Several of my friends and near relatives selected the barn for their winter quarters and I hope they are comfortable. Some live outdoors in sheltered places and some in other houses. A few of my younger brothers and sisters were still feeding in a filthy stable on the other side of the road last fall when I developed wings and flew away with filth sticking to me. This filth I have since wiped off on cake, bread, and other exposed foods in the pantry. Some of these brothers and sisters will no doubt escape the cold, as stable manure stays warm if it is permitted to accumulate in the stable all winter. These are now enclosed in small, hard brown cases and as soon as warm weather comes I shall go to the stable and see if I can find any of them.

"My city cousin says:

'We have had a few warm days but it is still too cool to venture out. In a few days I expect to move. I am hungry and need more air. I long for the day when I can leave the house for a warm sun-bath. Then I will find some filth on which to lay a few eggs There was plenty of filth around last fall and of course none of it has been removed during the winter. My first crop of eggs was laid about the middle of March. By the middle of April I bred grand children in abundance. By June my offsprings will have scattered all over town and by August we will be in full possession of the place, holding council in the City Hall, placing sick and wounded in the hospitals by the dozens, and handling the city government about as we please. This city does not fear us and is not prepared so by the time it gets ready for us we will be in full control. I hope we may have a successful year and all looks successful so far, but I hear that a big, bad man at the Missouri Agricultural Experiment Station is telling people how to spoil all that'."

Is winter work worth while? What can be done? First kill that boastful fly behind the doorcasing; then go to the attic and basement, to the garage and stable and let not one fly escape. Clean all stables and remove all filth in which the eggs and maggots may harbor, and scatter it in the fields. Be sure that all neighbors do likewise and if necessary induce the City Council to require that all premises are properly cleaned up during the winter. Then you will have at least a fighting chance with this filthy scourge of the human race. Preparedness means success in such a campaign.

L. Haseman,
Missouri College of Agriculture.

On lands not suited to alfalfa growing it might be a good plan to try white sweet clover. This crop will grow on land so poor that Alfalfa will not grow on and we have noticed it growing in places too wet for Alfalfa. While many extravagant claims have been made for sweet clover it will pay most any farmer to try it.

When It's Nitrate Time for Apples

Use 200 pounds of Nitrate of Soda broadcast per acre in late February or early March, or use at Blossom Time.

How About THIS Year's Crops?

When harvest time comes this year, what are you going to do with your wheat, your corn?

Are you going to have to rush it off to market when prices are down, or let it deteriorate from exposure to the weather?

Or are you going to provide storage room for what you raise, and get 100 per cent returns from your time and labor?

Wheat Bins, Corn Cribs, Hay Sheds—storage and protection for your crops — are the best investment you can make. They are sure-fire dividend payers.

Make that investment **NOW**, before the harvest rush comes. Prepare to Prosper.

You can build a strong, substantial, serviceable wheat bin, corn crib, or shed of honest, enduring

Southern Yellow Pine

"The Wood of Service"

for surprisingly little money. See your home lumber dealer and let him quote you prices. We will send you, **FREE,** detailed working plans for these or any other buildings you may need. Write today for these plans, stating your needs, and they will be sent you by return post. Please fill out the coupon with pencil.

David Dunne

A Romance of the Middle West

By BELLE KANARIS MANIATES

CHAPTER II

David struck out from the shelter of the woodland and made his way to his home, a pathetically small, rudely constructed house. The patch of land supposed to be a garden, and in proportion to the dimensions of the building, showed a few feeble efforts at vegetation. It was not positively known that the Widow Dunne had a clear title to her homestead, but one would as soon think of foreclosing a mortgage on a playhouse, or taking a nest from a bird, as to press any claim on this fallow fragment in the midst of prosperous farmlands.

Some discouraged looking fowls picked at the scant grass, a lean cow switched a lackadaisical tail, and in a pen a pig grunted his discontent.

David went into the little kitchen, where a woman was bending wearily over a washtub.

"Mother," cried the boy in dismay, "you said you'd let the washing go till to-morrow. That's why I didn't come right back."

She paused in the rubbing of a soaped garment and wrung the suds from her tired and swollen hands.

"I felt better, David, and I thought I'd get them ready for you to hang out."

David took the garment from her.

"Sit down and eat this ice cream Miss M'ri sent—no, I mean Joe Forbes sent you. There was more, but I sold it for half a dollar; and here's a pail of eggs and a drawing of tea she wants you to sample. She says she is no judge of black tea."

"Joe Forbes!" exclaimed his mother interestedly. "I thought maybe he would be coming back to look after the estate. Is he going to stay?"

"I'll tell you all about him, mother, if you will sit down."

He began a vigorous turning of the wringer.

The patient, tired-loking eyes of the woman brightened as she dished out a saucer of the cream. The weariness in the sensitive lines of her face and the prominence of her knuckles bore evidence of a life of sordid struggle, but, above all, the mother love illumined her features with a flash of radiance.

"Your a good provider, David; but tell me where you have been for so long, and where did you see Joe?"

He gave her a faithful account of his dinner at the Brumble farm and his subsequent meeting with Joe, working the wringer steadily as he talked.

"There!" he exclaimed with a sigh of satisfaction, "they are ready for the line, but before I hang them out I am going to cook your dinner."

I am rested now, David. I will cook me an egg."

"No, I will," insisted the boy, going to the stove.

A few moments later, with infinite satisfaction, he watched her partake of crisp toast, fresh eggs, and savory tea.

"Did you see Jud and Janey?" she asked suddenly.

"No; they were at school."

"David, you shall go regularly to school next fall."

"No," said David stoutly; "next fall I am going to work regularly for some of the farmers, and you are not going to wash any more."

Her eyes grew moist.

David, will you always be good—will you grow up to be as good a man as I want you to be?"

"How good do you want me to be?" he asked dubiously.

A radiant and tender smile played about her mouth.

"Not goodygood, David; but will you always be honest, and brave, and kind, as you are now?"

"I'll try, mother."

"And never forget those who do you a kindness, David; always show your gratitude."

"Yes Mother."

"And David, watch your temper and, whatever happens, I shall have no fears for your future."

His mother seldom talked to him in this wise. He thought about it after he lay in his little cot in the sitting room that night; then his mind wandered to Joe Forbes and his wonderful tales of the West. He fell asleep to dream of cowboys and prairies. When he awoke the sun was sending golden beams through the eastward window.

"Mother isn't up," he thought in surprise. He stole quietly out to the kitchen, kindled a fire with as little noise as possible, put the kettle over, set the table, and then went into the one tiny bedroom where his mother la yin her bed, still—very still.

"Mother," he said softly.

There was no response.

"Mother," he repeated. Then piercingly, in excitement and fear, "Mother!"

At last he knew.

He ran wildly to the outer door. Bill Winters, fortunately sober, was driving slowly by.

"Bill!"

"What's the matter, Dave?" looking into the boy's white face. "Your ma ain't sick, is she?"

David's lips quivered, but seemed almost unable to articulate.

"She's dead," he finally whispered.

"I'll send Zine right over," exclaimed Bill, slapping the reins briskly across the dropping neck of his horse.

Very soon the little house was filled to overflowing with kind and sympathetic neighbors who had come to do all that had to be done. David sat on the back doorstep until M'ri came; before the expression in his eyes she felt powerless to comfort him.

"The doctor says your mother died in her sleep," she told him. "She didn't suffer any."

He made no reply. Oppressed by the dull pain for which there is no ease, he wandered from the house to the garden, and from the garden back to the house throughout the day. At sunset Barnabas drove over.

"I shall stay here to-night, Barnabas," said M'ri, "but I want you to drive back and get some things. I've made out a list. Janey will know where to find them."

"Shan't I take Dave back to stay to-night?" he suggested.

M'ri hesitated, and looked at David.

"No," he said dully, following Barnabas listlessly down the path to the road.

Barnabas, keen shrewd, and sharp at a bargain, had a heart that ever softened to motherless children.

"Dave," he said gently, " your ma won't never hev to wash no more, and she'll never be sick nor tired agen."

It was the first leaven to his loss, and he held tight to the horny hand of his comforter. After Barnabas had driven away there came drudging down the road the little(lithe figure of an old man, who was carrying a large box. His mildly blue, inquiring eyes looked out from beneath their hedge of shaggy eyebrows. His hair and his beard were thick and bushy. Joe Forbes maintained that Uncle Larimy would look no different if his head were turned upside down.

"David," he said softly, "I've brung yer ma some posies. She liked my yaller roses, you know. I'm sorry my laylocks are gone. They come early this year."

"Thank you, Uncle Larimy."

A choking sensation warned David to say no more.

"Things go 'skew sometimes, Dave, but the sun will shine agen," reminded the old man, as he went on into the house.

Later, when sundown shadows had vanished and the first glimmer of the stars radiated from a pale sky, Joe came over. David felt no thrill at sight of his hero. The halo was gone. He only remembered with a dull ache that the half dollar had brought his mother none of the luxuries he had planned to buy for her.

"David," said the young ranchman, his deep voice softened, "my mother died when I was younger than you are, but you won't have a stepmother to make life unbearable for you."

The boy looked at him with inscritable eyes.

"Don't you want to go back with me to the ranch, David? You can learn to ride and shoot."

David shook his head forlornly. His spirit of adventure was smothered.

"We'll talk about it again David," he said, as he went in to consult M'ri.

"Don't you think the only thing for the boy to do is to go back with me? I am going to buy the ranch on which I've been foreman, and I'll try to do for David all that should have been done for me when I, at his age, felt homeless and alone. He's the kind that takes things hard and quiet; life in the open will pull him up."

"No, Joe," replied M'ri resolutely. "He's not ready for that kind of life yet. He needs to be with women and children a while longer. Barnabas and I are going to take him. Barnabas suggested it, and I told Mrs. Dunne one day, when her burdens were getting heavy, that we would do so if anything like this should happen."

Joe looked at her with revering eyes.

"Miss M'ri, you are so good to other people's children, what would you be to your own!"

The passing of M'ri's youth had left a faint flush of prettiness like the aftreglow of a sunset faded into twilight. She was of the kind that old age would never wither. In the deep blue eyes was a patient, reflective look that told of a past but unforgotten romance. She turned from his gaze, but not before he had seen the wistfulness his speech had evoked. After he had gone she sought David.

"I am going to stay here with you, David, for two or three days. Then Barnabas and I want you to come and live with us. I had a long talk with your mother one day, and I told her if anything happened to her you should be our boy. That made her less anxious about the future, David. Will you come?"

The boy looked up with his first gleam of interest in mundane things.

"I'd like it, but would—Jud?"

"I am afraid Jud doesn't like anything, David," she replied with a sigh. "That's one reason I want you—to be a big brother to Janey, for I think that is what she needs, and what Jud can never be."

The boy remembered what his mother had counseled.

"I'll always take care of Janey," he earnestly assured her.

"I know you will, David."

Two dreary days passed in the way that such days do pass, and then David rode to his new home with Barnabas and M'ri.

Jud Brumble, a refractory, ungovernable lad of fifteen, didn't look altogether unfavorably upon the addition to the household, knowing that his amount of work would thereby be lessened, and that he would have a new victim for his persecutions and tyrannies.

Janey, a little rosebud of a girl with dimples and flaxen curls, hung back shyly and looked at David with awed eyes. She had been frightened by what she had heard about his mother, and in a vague, disconnected way she associated him with Death. M'ri went to the child's bedside that night and explained the situation. "Poor Davey is all alone, now, and very unhappy, so we must be kind to him. I told him you were to be his little sister."

Then M'ri took David to a gabled room, at each end of which was a swinging window—"one for seeing the sun rise, and one for seeing it set," she said, as she turned back the covers from the spotless white bed. She yearned co console him, but before the mute look of grief in his big eyes she was silent.

"I wish he would cry," she said wistfully to Barnabas, " he hasn't shed a tear since his mother died."

No sooner had the sound of her footsteps ceased than David threw off his armor of selfrestraint and burst into a passion of sobs, the wilder for their long repression. He didn't hear the patter of little feet on the floor, and not until two mothering arms were about his neck did he see the white-robed figure of Janey.

"Don't cry, Davey," she implored, her quivering red mouth against his cheek. "I'm sorry; but I am your little sister now, so you must love me, Davey. Aunt M'ri told me so."

CHAPTER III

The lilac-scented breeze of early morning blowing softly through the vine-latticed window and stirring its white draperies brought David to wakefulness. With the first surprise at the strangeness of his surroundings came a fluttering of memory. The fragrance of lilacs was always hereafter to bring back the awfulness of this waking moment.

He hurriedly dressed, and went down to the kitchen where M'ri was preparing breakfast.

"Good morning, David. Janey has gone to find some fresh eggs. You may help her hunt them, if you will."

Knowing the haunts of hens, he went toward the currant bushes. It was one of those soft days that link late spring and dawning summer. The coolness of the sweet-odored air, the twitter of numberless dawn birds, the entreating lowing of distant cattle—all breathing life and strength—were like a resurrection call to David.

On the east porch, which was his retreat for a smoke or a rest between the intervals of choring and meals, Barnabas sat, securely wedged in by the washing machine, the refrigerator, the plant stand, the churn, the kerosene can, and the lawn mower. He gazed reflectively after David.

"What are you going to hev Dave do to help, M'ri?"

M'ri came to the door and considered a moment.

"First of all, Barnabas, I am going to have him eat. He is so thin and hungry looking."

Barnabas chuckled. His sister's happiest mission was the feeding of hungry children.

After breakfast, when Janey's rebellious curls were again being brushed into shape, M'ri told David he could go to school if he liked. To her surprise the boy flushed and looked uncomfortable. M'ri's intuitions were quick and generally correct.

"It's so near the end of the term, though," she added casually, as an afterthough, "that maybe you had better wait until next fall to start in."

"Yes, please, Miss M'ri, I'd rather," he said quickly and gratefully.

When Janey, dinner pail in hand and books under arm, was ready to start, David asked in surprise where Jud was.

"Oh, he has gone long ago. He thinks he is too big to walk with Janey."

David quietly took the pail and books from the little girl.

"I'll take you to school, Janey, and come for you this afternoon."

"We won't need to git no watch dog to foller Janey," said Barnabas, as the children started down the path.

"David," called M'ri, "stop at Miss Rhody's on your way back and find out whether my waist is finished."

With proudly protective air, David walked beside the stiffly starched little girl, who had placed her hand trustfully in his. They had gone but a short distance when they were overtaken by Joe Forbes, mounted on a shining black horse. He reined up and looked down on them good-humoredly.

"Going to school children?"

"I am. Davey's just going to carry my things for me," explained Janey.

"Well, I can do that and carry you into the bargain. Help her up, David."

Janey cried out in delight at the prospect of a ride. David lifted her up, and Joe settled her comfortably in the saddle, encircling her with his arm. Then he looked down whimsically into David's disappointed eyes.

"I know it's a mean trick, Dave, to take your little sweetheart from you."

"She's not my sweetheart; she's my sister."

"Has she promised to be that already? Get up, Firefly."

They were off over the smooth country road, Forbes shouting a bantering good-by and Janey waving a triumphant dinner pail, while David, trudging on his way, experienced the desolate feeling of the one who is left behind. Across fields he came to the tiny, thatched cottage of Miss Rhody Crabbe, who stood on the crumbling doorstep feeding some little turkeys.

"Come in, David. I suppose you're after M'ri's waist. Thar's just a few stitches to take, and I'll hev it done in no time."

He followed her into the little house, which consisted of a sitting room "with bedroom off," and a kitchen whose floor was sand scoured; the few

pieces of tinware could be used as mirrors. Miss Rhody seated herself by the open window and began to ply her needle. She did not sew swiftly and smoothly, in feminie fashion, but drew her longthreaded needle through the fabric in abrupt and forceful jerks. A light breeze fluttered in through the window, but it could not ruffle the wisp-locked hair that showed traces of a water-dipped comb and was strained back so taut that a little mound of flesh encircled each root. Her eyes were bead bright and swift moving. Everything about her, to the aggressively prominent knuckles, betokened energy and industry. She was attired in a blue calico shortened by many washings, but scrupously clean and conscientiously starched. Her face shone with soap and serenity.

Miss Rhody's one diversion in a busy but monotonous life was news. She was wretched if she did not receive the latest bulletins; but it was to her credit that she never repeated anything that might work harm or mischief. David was one of her chosen confidants. He was a safe repository of secrets, a sympathetic listener, and a wise suggester.

"I'm glad M'ri's hevin' a blue waist. She looks so sweet in blue. I've made her clo'es fer years. My how I hoped fer to make her weddin' clo'es onct! It wuz a shame to hev sech a good match spiled. It wuz too bad she h to hev them two chillern on her hands—"

"And now she has a third," was what David thought he read in her eyes, and he hastened to assert: "I am going to help all I can, and I'll soon be old enough to take care of myself."

"Land sakes, David, you'd be wuth more'n yer keep to any one. I wonder," she said ruminatingly, "if Martin Thorne will wait for her till Janey's growed up."

"Martin Thorne!" exclaimed David excitedly, "Judge Thorne? Why, was he the one—"

"He spent his Sunday evenings with her," she asserted solemnly.

In the country code of courtships this was conclusive proof and David accepted it as such.

"He wuz jest plain Lawyer Thorne when he wuz keepin' company with M'ri, but we all knew Mart wuz a comin' man, and M'ri wuz jest proud of him. You could see that, and he wuz sot on her."

Her work momentarily neglected, Rhody was making little reminiscent stabs at space with her needle as she spoke.

"'T wuz seven years ago. M'ri wuz twenty-eight and Mart ten years older. It would hev ben a match as sure as preachin', but Eliza died and M'ri, she done her duty as she seen it. Sometimes I think folks is near-sighted about their duty. There is others as is queer-sighted. Bein' crossed hain't spiled M'ri though. She's kep' sweet through it all, but when a man don't get his own way, he's apt to curdle. Mart got sort of tart-tongued and cold feelin'. There wa'nt no reason why they couldn't a kep' on bein' friends, but Mart must go and make a fool vow that he'd never speak to M'ri until she sent him word she'd changed her mind, so he's ben a-spitin' of his face ever sence. It's wonderful how some folks do git in their own way, but, my sakes, I must git to work so you kin take this waist home."

This was David's first glimpse of a romance outside of story-books, but the name of Martin Thorne evoked disturbing memories. Six years ago he had acted as attorney to David's father in settling his financial difficulties, and later, after Peter Dunne's death, the Judge had settled the small estate. It was only through his efforts that they were enabled to have the smallest of roofs over their defenseless heads.

"Miss Rhody," he asked after a long meditation on life in general, "why didn't you ever marry?"

Miss Rhody paused in her work, and two little spots of red crept into her cheeks.

"'Taint't from ch'ice I've lived single, David. I've ben able to take keer of myself, but I allers hed a hankerin' same as any woman, as is a woman, hez fer a man, but I never got no chanst to meet men folks. I wuz raised here, and folks allers hed it all cut out fer me to be an old maid. When a woman onct gets that name fixt on her, it's all off with her chances. No man ever comes nigh her, and she can't git out of her single rut. I never could get to go nowhars, and I wa'nt that bold kind that makes up to a man fust, afore he gives a sign."

David pondered over this wistful revelation for a few moments, seeking a means for her seemingly hopeless escape from a life of single blessedness, for David was a sympathetic young altruist, and felt it incumbent upon him to lift the burdens of his neighbors. Then he suggested encouragingly:

"Miss Rhody, did you know that there was a paper that gets you acquainted with men? That's the way they say Zine Winters got married."

"Yes, and look what she drawed!" she scoffed. "Bill! I don't know how they'd live if Zine hadn't a-gone in heavy on hens and turkeys. She hez to spend her hull time a-traipsin' after them turkeys, and thar ain't nuthin' that's given to gaddin' like turkeys that I know on, less 't is Chubbers' hired gal. No, David, it's chance enough when you git a man you've knowed allers, but a stranger! Well! I want to know what I'm gittin'. Thar, the last stitch in M'ri's waist is took, and, David, you won't tell no one what I said about Mart Thorne and her, nor about my gittin' merried?"

David gave her a reproachful look, and she laughed shamefacedly.

"I know, David, you kin keep a secret. It's like buryin' a thing to tell it to you. My, this waist 'll look fine on M'ri. I jest love the feel of silk. I'd ruther hev a black silk dress than—"

"A husband," prompted David slyly.

"David Dunne, I'll box yer ears if you ever think again of what I said. I am allers a-thinkin' of you as if you wuz a stiddy grown man, and then fust thing I know you're nuthin' but a teasin' boy. Here's a bundle, and don't you want a nutcake, David?"

No, thank you, Miss Rhody. I ate a big breakfast."

A fellow feeling had prompted David even in his hungriest days to refrain from accepting Miss Rhody's proffers of hospitality. He knew the emptiness of her larder, for though she had been thrifty and hardworking, she had paid off a mortgage and had made good the liabilities of an erring nephew.

When David returned he found Miss M'ri in the dairy. It was churning day, and she was arranging honey-scented, rose-stamped pats of butter on moist leaves of crisp lettuce.

"David," she asked, looking up with a winning smile, "will you tell me why you didn't want to go to school?"

The boy's face reddened, but his eyes looked frankly into hers.

"Yes, Miss M'ri."

"Before you tell me, David," she interposed, "I want you to remember that, from now on, Barnabas and I are your uncle and aunt."

"Well, then, Aunt M'ri," began David, a ring of tremulous eagerness in his voice, "I can read and write and spell, but I don't know much about arithmetic and geography. I was ashamed to start in at the baby class. I thought I'd try and study out of Jud's books this summer."

"That's a good idea, David. We'll begin now. You'll find an elementary geography in the sitting room on the shelf, and you may study the first lesson. This afternoon, when my work is done, I'll hear you recite it."

David took the book and went out into the old orchard. When M'ri went to call him to dinner he was sprawled out in the latticed shadow of an apple tree, completely absorbed in the book.

"You have spent two hours on your first lesson, David. You ought to have it well learned."

He looked at her in surprise.

"I read the whole book through, Aunt M'ri."

"Oh, David," she expostulated, "that's the way Barnabas takes his medicine. Instead of the prescribed dose after each meal he takes three doses right after breakfast—so as to get it off his mind and into his system, he says. We'll just have one short lesson in geography and one in arithmetic each day. You must n't do things in leaps. It's the steady dog trot that lasts, and counts on the long journey."

When David was on his way to bring Janey from school that afternoon he was again overtaken by Joe Forbes.

"Dave, I am going to Chicago in a few days, and I shall stop there long enough to buy a few presents to send back to some of my friends. Here's my list. Let me see, Uncle Larimy, a new-fangled fishing outfit; Barnabas, a pipe; Miss M'ri—guess, Dave."

"You're the guesser, you know," reminded David.

"It's a new kind of ice-cream freezer, of course."

"She's going to freeze ice to-night," recalled David anticipatingliy.

"Freeze ice! What a paradoxical process! But what I want you to suggest is something for Miss Rhody—something nice."

"What she wants most is something you can't get her," thought David, looking up with a tantalizing little smile. Then her second wish occurred to him.

"I know something she wants dreadfully; something she never expects to have."

"That is just what I want to get for her."

"It 'll cost a lot."

Joe disposed of that consideration by a munificent wave of the hand.

"What is it?"

"A black silk dress," informed the boy delightedly.

"She shall have it. How many yards does it take, I wonder?"

"We can ask Janey's teacher when we get to school," suggested the boy.

"So we can. I contrived to find out that Janey's heart is set on a string of beads—blue beads. I suppose, to be decent, I shall have to include Jud. What will it be?"

"He wants a gun. He's a good shot, too."

They loitered on the way, discussing Joe's gifts, until they met Janey and Little Teacher coming toward them hand in hand. David quickly secured the pail and books before Joe could appropriate them. He wasn't going to be cut out a second time in one day.

"Miss Williams," asked the young ranchman, "will your knowledge of mathematics tell me how many yards of black silk I must get to make a dress, and what kind of fixings I shall need for it?"

"You don't have to know," she replied. "Just go into any department store and tell them you want a dress pattern and the findings. They will do the rest."

"Shopping made easy. You shall have your reward now. My shanty boat is just about opposite here. Suppose the four of us go down to the river and have supper on board?"

Little Teacher, to whom life was a vista of blackboards dotted with vacations, thought this would be delightful. A passing child was made a messenger to the farm, and they continued their way woodward to the river, where the shanty boat was anchored. Little Teacher set the table, Joe prepared the meal, while David sat out on deck, beguiling Janey with wonderful stories.

"This seems beautifully domestic to a cowboy," sighed Joe, looking around the supper table, his gaze lingering on Little Teacher, who was dimpling happily. Imaginative David proceeded to weave his third romance that day, with a glad little beating of the heart, for he had feared that Joe might be planning to wait for Janey, as the Judge was doubtless waiting for M'ri.

The children went directly home after supper, Joe accompanying Little Teacher. Despite the keenness of David's sorrow the day had been a peaceful, contented one, but when the shadows began to lengthen to that most lonesome hour of lonesome days, when from home-coming cows comes the sound of tinkling bells, a wave of longing swept over him, and he stole away to the orchard. Again, a soft, sustaining little hand crept into his.

"Don't, Davey," pleaded a caressing voice, "don't make me cry."

(To be continued.)

We would like to have our boys and girls write us short stories about how they help father and mother.

Billy Sunday's Kansas City Revival

Will Begin in April and Last Eight Weeks

His sermons in full, and every detail of his tabernacle meetings, the greatest evangelist of the world in action, all fully illustrated, true to life, as real as if you were there to see and hear it all, will be printed in

The Weekly Kansas City Star

The greatest farm paper—Best market reports—Farm questions answered by experts—the news of the world condensed.

Five years $1.00, single year 25 cents. Subscribe today and get it all.

Address THE WEEKLY STAR, Kansas City, Mo.

REID'S YELLOW DENT SEED CORN Champion at Missouri State Show. Indiana type. The kind that has a deep, meaty grain; small cob; large ears; and yielded this year as high as 115½ bushels to the acre. $2.50 to $3.00 shelled; $3.50 to $4.00 crated in ear. F. O. B. Germination guaranteed. H. G. WINDSOR, Benvenue Farms, Boonville, Mo.

SOY BEANS

The premium beans in the Farm Bureau Contest. Mongol, Ito San, Aubern and Mikado. $2.60 to $3.50 per bushel. Sacks free.

JESSE J. CULP, - Warrensburg, Mo.

SEED CORN

Soy Beans, Cow Peas, Kaffir Corn, Milo Maize, Millet, Sudan Grass and all grass and field seeds.

Best varieties of each, carefully selected for purity and germination. Prices absolutely right and satisfaction guaranteed. Write for prices. Saline County grown seed corn our specialty.

LEONARD SEED CO., - Marshall, Mo.

Build Your WORN OUT SOIL SWEET CLOVER

The great crop for soil fertility and animal feed. Exceptionally rich in nitrogen and humus. Higher protein content than alfalfa. Sow in spring, summer or winter. Write for prices.

Bokhara Seed Co., Box F, Falmouth, Ky.

Seed Oats -- Seed Corn

Pride of Saline—A yellow Dent seed corn. Heavy ears, very deep kernel, shells immensely. $2.25 per bu., shelled, tested.

K. H. BROWN, Bolivar, Mo.

SEED CORN

Johnson County White, the best I ever grew and all in crib by Nov. 1. Price low this year, $2.25 single bushel, $4 for two bushel bag, shelled. Crated $3 a bushel, extra selected ears. Order early.

THE STORY OF A DRAINAGE DISTRICT

When our fathers first came to this country there was nothing to do but till the soil and tend the crops. The land was full of substance and produced in profusion all the crops that mature in this climate, but, as time went on, much of the land they had cultivated became exhausted. Early in our history, lands that threatened a decline in crops were either rested a year or sown to grass; but in the last twenty years the plan has been found to be unprofitable. The investment alone makes the plan of rest impractical. On the other hand, our lands no longer respond quickly to the seeding down process, for it seems almost impossible to any longer get a well-sodded pasture. At this period it does not take one of very penetrating judgment to realize that other plans must be adopted. The time has come when now as heretofore neglected property is attracting the attention of farmers and investors.

Branch bottoms and valley lands in all countries and in all ages have been the last lands to be improved. These lands do not seem to arrive at their own until that time in the high lands history when it costs more to restore them to their former fertility than it costs to reclaim the bottom lands. And why should there be any cause for ill feeling when a movement to reclaim the long neglected bottom lands makes itself manifest? It is puzzling to think why there should be factions that both openly and secretly fight a progressive movement—an enterprise that when perfected would benefit every humble citizen. Can it be that such people are ignorant of what is going on?

Prejudice to Overcome

There are two kinds of people to overcome in the movement for a drainage district: those who fight every enterprise and those who do not show a hostile spirit, but seem insensible to the fact that there is something to be done. The first thinks that progressive enterprise is dangerous to his interests, and the second man believes there is no way out. And yet both must some day give way to the man whose hope is for better things.

Let us stand upon the ridge of Salt River Valley up in Northeast Missouri—in the fall of the year, with a normal season—before we descend to the low bottoms. From this high point, looking across the valley, are seen fields of corn and wheat, meadows and orchards. Higher up on the opposite hill, tops of trees are visible and just above the tree-tops a patch of Missouri blue sky. Men and horses are working in the valley below. Home people and non-residents are spending their money for development. Contrast this scene with the one below the canal, where there are stagnant ponds, furnishing natural breeding places for the deadly mosquito that preys upon human beings and live stock, making it impractical and unprofitable for growing stock.

While I am writing this article Salt River is out of its banks both above and below the canal, producing on one bottom the appearance of an inland sea. As the great flood from the north, covering the bottom from foot-hill to foot-hill, enters the big ditch, the water is carried down without any sign of overflow on either side for over a mile. Here the banks of the ditch were left natural for the purpose of taking care of the hill water. At this point there are eighty to a hundred acres of ground covered with shallow water that partly comes from the hills. The ditch being already taxed to its fullest capacity, this water stands for hours before it begins to recede. A succession of floods coming from the north repeated this condition several times; but it must be borne in mind that before the ditch was completed many hundreds of acres met this fate annually as compared with one hundred now. Hundreds of acres of small grain are now harvested; hundreds of head of cattle are now pastured on the best of bluegrass pasture—pastures which formerly were annually destroyed and the cattle taken to the hills for safety and food.

The great ditch is by no means a cure-all for all the evils of overflow. The ditch is only the initial step. It would be a calamity if the citizens of this great state were to throw up their hands and declare that the four millions of acres of rich branch bottom lands could not be reclaimed, or that the worn-out and depleted lands could not be restored to their former fertility. Last year the corn was planted in the valley in April, an unheard of event heretofore.

We find many theories advanced as to how to get the best results from bottom lands. Some advocate one plan, some another. Naturally, those who have had but little experience favor the cheaper way of building levies and cutting bends in the river with teams; but among people of experience there seems to be no disagreement—the straight, deep canal. The longer, the deeper and wider the better. Length cheapens the proposition in the way of reducing the administration expenses, gives the proposition a general endorsement and favorably affects the price of land.

Many Plans Advocated

As I am not an engineer and do not pretend to furnish a plan of drainage, I must write as one farmer to another. The profits of agriculture must be increased, so let us agree that economic changes must come about rapidly. It is as clear today to the thinking farmer as it is to the statesman. The farmer who today enjoys a clear reflector is interested in the how to reduce the cost of production; the loss resulting from bad seasons must be reduced to the minimum by the intelligent control of the natural elements. One of the first moves—I say the "first," because all depends upon the soil—is to put the land in condition to yield that crop for which it is best constituted by nature. To strengthen our argument, let us picture to ourselves eighty acres of land lying on Salt River bottom. The history of this eighty acres might answer for four million similar acres that are now producing aqueous plants instead of corn and wheat, which require a certain condition of environment.

Now, if these conditions are not under human control this pattern of eighty acre and its four million similar acres must forever be idle, its best offices to furnish water for the tadpole and low brush for the whippoorwill. Corn does not thrive on this land in its natural state, even though you plant it in an apparently dry condition. Should it sprout it perishes under a warm and cherishing sun. What is wrong? Temperature. Corn and wheat, to thrive, must have a tempeature conducive to growth. There is a minimum temperature at which all growth ceases, no matter how favorable other conditions might be. Every plant is adapted by habit to certain degrees of warmth; any condition of the soil that tends to lower the temperature naturally retards growth.

Opposition and Assets

In endeavoring to promote a ditch scheme, every agency and mite must be considered. In our recent experience of promoting the Valley Drainage District we found the opposition really an asset. At first, this was hard for us to realize. The opposition was composed of an obstinate minority. They employed a first-class attorney whose business of course was to knock out the whole scheme. This hindrance to the cause brought out the more silent features, some very dangerous points, but we recognized and realized from the very force itself that it made us more careful during the administration period. They also employed a competent engineer. This made our engineer careful and there were no mistakes made. In their case you might compare the pull-backs with the wind that pushes against the sails of a ship or the stiff atmosphere that holds a kite in the air. In this case the opposition acted as a safety, a ballast to keep the crowd that was for it closer to earth. The promoters of the ditch scheme are never blind to the facts brought out by the opposition. This is why, perhaps, we completed the best ditch ever dug in Missouri, considering size. And what made the opposition doubly profitable was the fact that they paid their own lawyer and furnished us with some of the finest points gratis.

Today we have the ditch and are enjoying all its benefits, while the losers paid out their money and have nothing to show for it. This is usually the way the world over. The opposing retrograde crowd usually loses on the principle that "The world does not move." The fact that they lose, puts them in for all the cost. The progressive crowd receives all the benefit and all the information they gather up also comes to the progressives as a rare and precious gift. It is puzzling to think that a class of apparently good neighbors and citizens will fight business. It is hard to think that we still have with us a class that scoffs at the student farmer, but there is a class that is still sticking to the advice of the ignorant, who, by following, has brought them to red and barren soil and to calamities unnumbered.

With all our opportunities for learning the easier and better way, there is a class that still holds to the old opinion. That habit of mind seems to be their dearest object of affection. Holding on to prejudices that have been discarded by even a lower strata of civilization and entertaining a notion that if things cannot be done their way of thinking, nothing new can be accomplished. Their idea, "To be old is to be wise" and that all improvements are dangerous and their self-satisfaction that their knowledge is complete. While other states are forging ahead and redeeming waste lands, the practice considered by them a violaton of nature, unwilling to notice passing events, proud of being rooted to one place and vain of the fact that they have been able up to this time to sidetrack and elbow the rights and privileges of other people by hindering natural growth.

Henry Funk, Knox County.

OLEOMARGARINE FRAUDS

If it were not for the fact that there is so much profit in selling oleomargarine for butter the manufacturers would not find so many ways of violating the law. The Secretary of the Treasury reports that the fraudulent sale of colored oleomargarine by five manufacutrers has defrauded the Government out of more than $19,000,000 in six years. Under the law manufacturers pay one-fourth of a cent a pound for uncolored oleomargarine and 10 cents a pound for that colored yellow like butter. These men had bought the stamps for the uncolored and placed them on the colored goods.

It is now proposed by the National Dairy Union that Congress should pass a law forbidding the coloring of oleomargarine above a standard of 70 per cent white, except that any one may color it as they like for their own family use.

"The bill introduced provides that the name of oleomargarine shall be changed to margarine, that it shall be sold in ½, 1 or 5 pound packages properly marked, wrapped and branded, that books shall be kept in such form as is perscribed and open to inspection, that a strip stamp shall be wrapped around each wrapper instead of the coupon stamp now used, for a flat tax of 1 cent per pound on all margarine, for special taxes on manufacturers, wholesalers and retailers, that the sale of margarine shall be subject to the laws of the state and shall not be exempt therefrom by reason of being introduced in the original packages or otherwise, and for heavy penalties for violations of the law."

GET SOME BEES!

Have you bees?

Why waste a honey crop?

Why let your neighbor's bees get your crop?

Buy bees by the pound with a good Italian queen.

Get a few swarms of your own this spring or summer.

Catch runaway swarms during May and June and hive them in good hives.

Transfer swarms and comb from bee-trees to movable frame hives on warm days early in May.

Buy neglected stands of bees and take care of them and give them a chance. The bee is a faithful and deserving creature.

Furnish a neighbor bee-keeper with a few hives, with frames and comb foundation starters and pay him for hiving a few swarms in them for you.

Buy good strong colonies of bees in hives with straight combs. These should be secured from some one known to be reliable and experienced in bee-keeping.

Buy a few nuclei from a reliable bee-supply man. A nucleus is a part of a colony of bees secured by dividing up a strong colony into two, three or four parts, putting each part in a separate hive to build up into a full colony.

Full directions for taking care of bees and for getting a few swarms for a start by these and other methods are included in a bulletin on Farm Bee Keeping by L. Haseman of the Missouri College of Agriculture, and E. E. Tyler, President of the Missouri Agricultural Society. It can be secured by addressing the Agricultural Experiment Station, Columbia, Missouri.

NATIONAL EGG LAYING CONTEST

The contest made a good record in March. The highest record in 1912 was in April, all hens averaging approximately 19 eggs each. During 1913, the highest month's record was in April, with an average of 18.5 eggs each; 1914, the highest month's record was in March, of 18.5 eggs each; 1914, the highest months record was in March, with an average of 20.5 eggs each; 1915, the highest month's record was in March, with an average of 20 eggs each, and during March, 1916, 520 hens laid 10,756 eggs, or approximately 30.7 eggs each.

One point which is very noticeable is the equal record made by many hens. Pen 11, S. C. White Leghorns, all five hens laid 22 eggs each during the month.

It has been noted many times that the hen which produces more than 20 eggs in one month usually makes a good record for the year. One hundred forty-two hens in the contest produced 24 or more eggs during March while only 50 produced 12 or less. This would indicate that a number of hens should make good records during the year.

Hen 1 in pen 74, White Plymouth Rock, laid 31 eggs during March, which is an unusually long cycle.

Pen 82, Black Orpingtons, Indiana, won the cup for March by laying 136 eggs.

The pens making the five highes records for March are as follows:

Pen 82 Black Orpingtons, Indiana .....136 eggs
Pen 73 White Plymouth Rocks, N. Dakota, ...130 eggs
Pen 74 White Plymouth Rocks, Missouri, ...130 eggs
Pen 83 Black Orpingtons, Missouri, ...129 eggs
Pen 30 S. C. White Leghorns, Missouri, ...128 eggs
Pen 56 S. C. Reds, Iowa.....127 eggs
Pen 75 White Plymouth Rocks, Washington, ...127 eggs

C. T. Patterson, Director,
Missouri State Poultry Experiment Station, Mountain Grove, Mo.

The Sixth National Egg Laying Contest to begin November 1, 1916, and continue for one year, will be held on the same grounds as the contest now in progress. The contest will be composed of sixty pens, three pens of each variety, the first three applications received at the Experiment Station in each variety being the ones accepted. Each pen is to be composed of five pullets and one substitute, no males to be used in the pens. Complete rules governing the contest will be ready for distribution in the near future.

A New Director at Mountain Grove

The poultry readers of The Missouri Farmer who have become so well acquainted with Professor C. T. Patterson, formerly Pathologist of the Missouri Poultry Experiment Station at Mountain Grove, through the splendid articles he has written for publication, will be pleased to learn that the governing board has elected Professor Patterson, director of the station. The Missouri Poultry Experiment Station has attracted nation-wide publicity under the directorship of T. E. Quisenberry who recently resigned and we have no doubt that Professor Patterson will not be able to go right on with the further development of the station.

While the poultry business does not look large to the individual, in the aggregate it is one of Missouri's important industries for the annual receipts from poultry and eggs amount to more than $50,000,000, most of the family expenses in a great many homes are paid out of the poultry account.

Swat the Rooster and Increase Your Profits

Swat the Rooster on May 20th and sell infertile eggs during the summer. It insures greater profits to the producer, the dealer can handle them on a smaller margin, and the consumer gets better eggs to use which increases the demand.

The presence of male birds in the flock does not increase egg production but from two to three percent of the females are injured by the males which lowers the egg yield from the entire flock.

Feeding the male birds after the breeding season is a useless expense. Many produce dealers pay more for roosters on Swat the Rooster Day in order to encourage their sale.

If an egg contains the fertilizing germ proper heat is the principal factor which will cause the germ to grow. The summer temperature will cause the germ to develop and if it is chilled or killed in any way, it is the point where decomposition begins. If there is no germ in the egg there is no point for decomposition to set in except from an outside source. Therefore, infertile eggs are more satisfactory for all concerned.

It should not be understood that infertile eggs should be kept longer or cared for improperly for that would mean no improvement over old methods. Inferior eggs should be marketed just as often and cared for just as carefully as fertile eggs which will insure an improved product going on to the market.

All eggs should be sold on the loss-off basis; i. e., all eggs should be candled and only the good eggs paid for. It will be seen that ten dozen infertile eggs, all good, will bring more money than twelve dozen fertile eggs if three dozen are candled out, being bad.

If you have a valuable male bird which has proven to be a good breeder, don't sell him, but place him in a pen with half a dozen of the best hens and late hatching may be done from this pen.

Don't keep any males in the flock during the summer.

Will you try the new Grains, Feterita and Sudan Grass at our expense, with the Flower Garden, as shown above, thrown in for good measure? See our offer below.

Feterita, the new cereal. This new grain is proving itself to be of wonderful value in times of drouth. It will grow and mature a crop of seed in from 75 to 90 days time. One single seed will make a plant having from five to ten stalks and each stalk will grow a head of seed, the larger ones weighing about one pound. These heads of grain are easily gathered and stored and have a variety of valuable uses. Crush the grains and cook them and you have a nice breakfast cereal. The grain when ground into flour makes a very fair substitute for wheat flour. Feterita is very much like Kafir in chemical composition and of all its different uses perhaps the greatest is its value as a food for poultry. A small field will grow enough seed for a good size flock of chickens and the fodder is readily eaten by horses and cattle. We want to send you a package of seed large enough to plant a 2 rod square patch of ground. This will give you a chance to try it as a breakfast cereal and enough to see what it will do as a poultry feed. If you like it you can save eough seed from this trial planting to plant a large acreage next year. See our offer below.

Sudan Grass. This wonderful new hay crop is succeeding in all parts of the country. It grows from seven to nine feet tall and stools out very thickly, a single seed producing a plant that will throw up from thirty to sixty stems. Sudan Grass does not lodge and go down after rain and wind storms as does millet and other grains. Horses, cattle and other stock like it and thrive on it in all stages, green or cured. A small patch will grow enough extra fine hay to provide for a horse and cow. The plant is an annual and dies root and branch in fall or after maturing a crop of seed. Usually makes from two to three cuttings of hay per season. Succeeds in dry season where most of other crops would be burned out.

We want to send you a package of Sudan Grass seed sufficient to plant a 2 rod square patch of ground. From this trial patch you can raise enough seed to plant a large acreage another year. See our offer below.

Our Flower Garden. We always did admire a nice flower garden and in this special bed we have over 150 different varieties of our choicest annuals that will commence to bloom early in season and continue until stopped by frosts in fall. This flower bed will be a constant source of pleasure and delight to you as the different varieties come into bloom.

We want to send you a large package of seed, enough to plant a bed a rod long.

Our Offer.—Send us a dollar to renew your subschiption to The Missouri Farmer—or if your subscription is paid up send us a new subscription at three years for one dollar, when we will send you postpaid a package of Feterita sufficient to sow a two rod square patch of ground and a package of Sudan Grass sufficient for a bed a rod long. With the seeds will be full directions for sowing, etc., and from these plots you will derive enough seed to furnish you with a supply for future use. Cut out and mail the coupon to-day.

THE MISSOURI FARMER, - COLUMBIA, MO.

Gentlement:—For the inclosed Dollar please send The Missouri Farmer for three years and the FETERITA, SUDAN GRASS and FLOWER SEEDS as per your offer, to the name below.

BROODING YOUNG TURKEYS

If the weather is warm and dry no shelter is required, as the poults do better in the open. Should it be rainy, however, they need to be protected, for nothing is more injurious than for them to become wet and chilled. The most satisfactory plan is to confine the mother turkey hen to a coop and allow the poults to run in and out whenever rain does not prevent. This coop should be placed in a field where they can run out and find grasshoppers, green vegetation, and other feed. The coop should be moved to fresh ground every day.

Improper feeding, combined with close confinement, has been the cause of many failures in turkey raising. Given free range on the average farm, the poults can easily pick up their own living, and one light feed a day for the purpose of inducing them to come in at night is sufficient. If the mother hen is confined to a coop and the poults allowed to run in and out, three times a day is often enough to feed and very little should be given at a time. The poults should always be ready to eat; if given all they will clean up several times a day, indigestion will be the result. If there is little or no feed outside the coop for the poults to pick up, then they should be fed about five times a day, feeding only a small quantity at a time. A good feed for the first few days is stale bread soaked in milk and squeezed dry. Corn bread crumbs and clabbered milk or cottage cheese is also quite often fed and with excellent results. Green feed and grit should be on hand at all times. As the poults grow older, the ration should gradually be changed to grain.

Lime for Preserving Eggs

Eggs laid during April and May are of better quality for preserving than are those laid later in the summer. One pound of air-slaked lime added to cooled, boiled water is equally as good a preservative for eggs as water glass. Only clean, fresh eggs with sound shells should be "put down." Use an earthen jar. Stir the lime thorughly into the water and drop the eggs in as gathered. Some lime settles to the bottom of the jar but does no harm. Two or three inches of the solution should cover the eggs to allow for evaporation. Keep in a cool place, preferably in a cellar. Eggs preserved by this method may be safely kept for eight months. When ready for use, remove only the eggs that are necessary.

The Cream Separator

The cream separator is now of as much importance to the man who keeps cows to milk as the binder is to the man who grows wheat. It has been found by numerous tests that about one-fourth more butter is made where the separator is used than where the old process of skimming by hand is practiced. The price of one cow will buy a separator and if a man is now milking only five cows he can make money by selling one of them and buying a separator because from the four he can get the same amount of cream and he will save the feed of one cow which is quite an item when grain is worth what it is now.

While a man can make it pay with four or five cows to buy a cream separator we do not think it advisable for any one to keep so few cows at least not longer than he can find the means to increase the number. The man who keeps cows at all for cream production will find it more profitable in every way to keep all that his farm will feed and his help will permit. A few cows will require the same close attention that a good herd will require and the profit per cow ought to be a little larger with the bigger herd.

Bruns & Son's Jerseys

Wm. H. Bruns & Son, Corcordia, Mo., are offering a number of Jersey bulls old enough for service that are sired by the great bull, The Owl's Champion 85990. The grand dam, on dams side, of this bull, Rubano's Fancy, holds a record of 21 lbs. 10 oz. of butter in 7 days. The prices on these young bulls are extremely reasonable.

Baker & Son's Poland China

W. A. Baker & Son, the well known Poland China breeders of Butler, Mo., advise us that their spring crop of pigs is by odds the best they have ever raised. This firm was one of the strongest buyers at the winter sales and consequently they will be able to offer the public a wide variety of bloodlines, all of the best. The pigs of their own raising will of course represent the blood of their winning boars and sows. It is not to early to get in correspondence with this firm and learn what they have to offer.

The Angus Breeder's Association Annual Bull Sales

Any of our readers who are in the market for an Angus bull can hardly afford to overlook the exceptional opportunity afforded by the four bull sales announced in our last issue, to be held at St. Joseph, Mo., April 25, Omaha, Nebr., April 26, Sioux City, Ia., April 27, and St. Louis, Mo., May 2. Over 260 bulls will be sold in these four sales and it should be of interest to know that after a careful survey of the available bulls now in the hands of breeders, the association announces that these 260 bulls are just about all that will be for sale. Every bull to be sold has been passed on by the association and buyers can feel sure that they will have a choice lot to pick from. This is the largest offering the Angus breeders have ever put up for sale and there are bound to be some rare bargains slip by. Any of our readers who are interested should send at once to Chas. Gray, Secy., 817 Exchange Ave., Chicago, for the catalog. Please remember that the advertiser and the publisher will appreciate having you mention where you saw the advertisement.

Snyder's Red Poll's

M. L. Snyder, Polo, Mo., is now offering several good young Red Polled bulls sired by Logan 13500, and by Knocker 28791. Mr. Snyder has been breeding Red Polls for over sixteen years and during that time has aimed to develope his herd along dual purpose lines. He selected this breed because he felt that it came nearer meeting his idea of the average farmers need than any other and he has always believed that what the farmer wanted was a combination of milk and beef. If interested in this breed Mr. Snyder would be glad to hear from you.

Williamson's Polands and Shorthorns

H. S. Williamson, Centralia, Mo., is prepared to take care of orders for either Poland Chinas of strictly big type breeding, or Shorthorns. The Oakwood herds have long been drawn on by Missouri farmers in search of breeding stock to improve their herds, and Mr. Williamson states that he has never had a better lot of stuff to offer buyers than will be found on his farm at the present time.

Among the bulls now ready for sale and old enough for service are several attractive youngsters that are being priced worth the money. These bulls are well bred, of good type and are reds, roans and whites. We feel sure that our readers will do well to investigate this offering before buying. In Poland Chinas, Mr. Williamson, offers most anything of either sex or age that the prospective buyer needs. Get his prices and kindly mention this paper when writing.

Taylor's Duroc's, the Champion Kind

Chas. L. Taylor, Olean, Mo., whose herd of Durocs is ranked among the best of the breed reports that his spring pigs are showing up in fine shape and that he will soon be ready to fill the orders of Missouri Farmer readers. No herd in Missouri has attracted more favorable attention or proven a greater claim to first place than the Col. Wonder herd. There is today more champion blood in this herd than any herd the writer is familiar with, and not only is this true, but it is the kind of blood that goes on and makes good.

Mr. Taylor will be glad to answer any questions our readers may ask concerning his herd and he will also be glad to advise in the selection of breeding stock —and we know of no man more capable of picking the right kind.

Black and White Farm Holsteins

E. M. Holbrook, owner of the Black and White herd of Holstein cattle advertised in this paper states that he now has a number of very desirable young bulls for sale. These bulls are strong, well marked youngsters and represent some very high producing strains. Mr. Holbrook will be glad to furnish pedigrees, records, and prices to any of our readers who are interested. Please mention this paper when you write.

Spring Grove O. I. C's

Our readers who are interested in O. I. C. hogs are referred to the well known firm of S. D. & B. H. Frost, Kingston, Mo., which appears elsewhere in this issue. This is one of the very oldest herds owned in Missouri having been established over thirty years ago by L. L. Frost, father of the present owners. From the very first the selections for the breding herd have been made from the best the herd afforded. A high standard was set with the first purchase and that standard has never been lowered. The fact is attested to by the long string of winnings the herd has to its credit. For years the herd competed at the best state fairs and in 1904 at the World's Fair at St. Louis, the Spring Grove herd came out with the highest honors. Natrually, with a herd so long established and handled by one firm a rather definite type has been fixed and a marked uniformity in the herd is very noticable.

The present crop of spring pigs are even better than the 1915 crop, and at the time the writer thought that bunch one of the most attractive lots he had seen. The litters, too, are larger this year,—

The Frost type of O. I. C's. One breed in one family for thirty years has served to fix the type.

POLAND CHINAS

Smooth Columbus
THE BOAR THAT PUT MISSOURI ON THE MAP. HEADS OUR HERD

SMOOTH COLUMBUS BLOOD has held the record in Missouri for two years—it will do it again next year. Fall pigs, either sex, by this great boar, now offered for sale.

BENNETT BROS. R. 5. LEE'S SUMMIT, MO.

Spring Boars by the Grand Champion

A desirable lot of early spring boars by The Giant, acknowledged to be one of the greatest young Poland China boars of the breed. Prices within reach of all.

WILL G. LOCKRIDGE - - - - - - - Fayette, Mo.

Poland Chinas & Shorthorns

Bred sows and gilts. The real big kind with bone and quality. A few serviceable boars. Several extra good young bulls and heifers. Satisfaction guaranteed.

H. S. Williamson, Route 6 Centralia, Mo.

BAKER'S REAL BIG-TYPE POLANDS

We have a number of extra good spring boars sired by Big Look that we are offering worth the money. Need the room and must sell.

W. A. BAKER & SONS, BUTLER, MO.

Linhardt's Polands

I have a choice lot of extra good fall gilts sired by outstanding boars. Customers in 26 states. GIANT MAMMOTH 68375 and CHIEF BIG BONE 75856 in service. Priced for farm trade.

H. O. LINHARDT, LOHMAN, MO.

DOOLEY'S SPOTTED POLANDS

Big bone, spotted pigs now ready to ship —$25 single pig, $45 pair, $65 trio. Pair and trios no relation. Also registry furnished. Send check with first letter.

EDGAR DOOLEY, - Ettervile, Mo.

DUROC JERSEYS

THE BEST DUROC BLOOD--COL. WONDER

At recent Missouri State Fair my herd won 35 ribbons—3 championships, 15 firsts. Col. Wonder sires my champions—he will sire them for you. Choice bred gilts. Nothing but the best sent on mail orders.

CHAS. L. TAYLOR - - - - - - Olean, Mo.

Durocs With Size and Bone

I am offering a choice lot of early spring pigs with unusual size, bone and quality. Bred right and priced right. Visitors welcome.

A. C. BROCKMAN, R. F. D. 2, Centralia, Mo.

50 DUROC BOARS

High Class Fall Boars, from the Big Type Herd of Mo. That produced All The First Prize Jr. Pigs at the Mo. State Fair 1915. Some rare opportunities. Sired by the great breeding boar, Unsell's Defender. From Americas most noted Duroc Sows. Make your selections early. Write today.

DR. J. B. UNSELL, - Louisiana, Mo.

Big Duroc Fall Gilts

We offer for sale our herd boar sired by Wellie's Example and out of a Whiskey & Faith sow. Also a few September boars. Booking orders for spring pigs.

R. L. (Bob) HILL, - Columbia, Mo.

Young stock sired by Dean's Eric 139686. Also offer splendid herd bull for sale. Every one the right kind and priced to sell.

V. E. LAWRENCE, SALISBURY, MO.

Angus Bargains

Registered bulls and heifers. The market topping kind. Leading families represented. Priced worth the money and satisfaction guaranteed.

Also Poland China Hogs.

J. M. JONES, R. F. D. 3, EVERTON, MO.

100 EARLY O. I. C. SPRING PIGS

10 GOOD FALL GILTS

Guarantee and pedigree accompanies each sale. This herd has been exhibited at World's Fairs and State Fairs for years, so that most of our pigs have prize winners on both sides of their pedigrees. We can furnish pairs and trios, no kin. We are making bargain prices on early orders. Write us today. Address,

S. D. & B. H. FROST,
Box H. Kingston, Mo.

the first ten sows farrowed 110 pigs. Most of the pigs now offered are sired by a son of Gage's Leader 478630 O. I. C. the champion under a year boar at the Inter-State Fair, St. Joseph, Mo., 1914. At the Kansas State Fair, 1915, he was second in class and two weeks later, at the Missouri State Fair he defeated the boar that won over him at Topeka. Prctically all the pigs offered are rich in the blood of winners. All are immune and sold on a liberal guarantee.

We are always glad to recommend the herd to our readers because we feel certain that they will be pleased. In writing please mention this paper.

TO KEEP HOGS WELL

The loss from cholera and from carelessness in feeding and handling pigs up to weaning amounts to a total tax of $1.00 per hundred pounds live weight on all the hogs marketed in the United States. Much of this loss can be avoided.

The selection of breeding hogs with strong constitutions forestalls a large proportion of ordinary losses. Strong lungs, heart, liver, kidneys, stomach and intestines are as necessary as good shoulders, loin and hams. Strong vitality is indicated by a well arched back, deep, well-sprung ribs, the body thick through the heart and broad between the fore legs and the animal standing well up on its toes. Avoid breeding animals that are sway-backed, that drop behind the shoulders, are narrow through the heart and between the fore legs and have weak pasterns.

To secure vigor and health, the sow, as soon as bred, must be fed flesh and blood-making feeds and mineral matter to develop fully the unborn pigs. The growing pigs must have muscle and bone-making feeds, healthful surroundings and plenty of exercise. There must be an ample supply of pure water, comfortable shelter and freedom from lice and worms.

Men who select, breed and feed their hogs for strong vitality do not have 25 per cent of the loss from disease as do the average farmers who raise hogs carelessly.

Lice

Whenever a pig has good feed, water and surroundings and is unthrifty, look for lice. Much of the loss laid to cholera, worms and mysterious diseases is caused by lice. Oil is the destroyer of lice. Crude oil is the cheapest; kerosene is dangerous.

Oil may be applied with a rag where only one hog is to be treated. Automatic hog oilers are sold by hardware and implement dealers. Several short posts may be set in the hog yards and pastures. Wrap each post with several thicknesses of old sacks. Once a week soak the sacks with crude oil. A louse bites a pig, the pig rubs the spot on the oiled sack, the oil kills the louse.

A dipping vat may be filled with water which is covered with a thin film of crude oil. Lice will be kept in check if the pigs are run through the vat once a month. The most convenient way to keep pigs free from lice in hot weather is to furnish them a hog bath. They will rid themselves of lice when they have this bath.

Worms

Worms probably cause the greatest losses in hog raising next to cholera and poor feeding. The hog affected by worms deposits the eggs and the embryo worms with his droppings. These get in the dust and dirt in the feed lot, around the buildings and in the pasture, and are taken into other hogs' bodies with the feed. Eggs and worms are frequently washed into streams and ponds, and hogs take them in with their drinking water. The worms develop in the hog's body and feeding on it, make him unthrifty.

The best preventative of worms is clean feed lots and shelter, the daily cleaning of troughs and feeding floors and a frequent change of pasture. One great advantage of the portable hog house and the hog waterer attached to a barrel is that with these two aids, a change of feed lots and pasture can be made easily and cheaply.

The loss from worms is largely reduced by keeping soft coal always before the pigs. An effective remedy is santonin. Use an ounce for each 5,000 pounds live weight of swine, 50 hogs weighing 100 pounds each. Mix it thoroughly with thick slop. Keep the pigs off feed from night until the next noon, and then divide them into small lots so that every pig will get his sare.

There is a temporary shortage of santonin, due to the European war. Fairly good results may be secured by using as a substitute one teaspoonful of turpentine for each 80 pounds live weight of pig, putting the turpentine in milk. The pigs should be allowed to become hungry and should be divided into small lots, the same as when giving santonin.

Water Supply

Hogs need a supply of fresh, clean water where they can drink it as often as they become the least bit thirsty. They thrive much better when drinking small quantities of water frequently than when forced to go a considerable time without water and then consume large amounts. Dirty water hurts digestion and is one of the chief carriers of disease. On most farms the returns from the feed are greatly lessened because the hogs do not have an abundant supply of clean water so close to them that they will drink often. Gains are cut down quicker by an under-supply of water than by too little feed.

A convenient way to furnish clean water is to use an atuomatic hog waterer that can be attached to a barrel or tank. These devices have small drinking pockets just outside the barrel and when a hog drinks out of one of these pockets, fresh water flows into it from the barrel. The barrel may be mounted on a sled, be filled every day and taken to any field where there are hogs. As long as there is any water in the barrel the hogs will have a clean drink, and each field will be as well supplied with water as though there was a good well in it. These automatic waterers cost $2.00 or less each, and every farmer in the corn belt should have a sufficient number to supply the needs of his hogs.

It is not safe to water hogs from a running stream, as the stream is likely to carry disease.

The Hog Bath

The hog bath is the cheapest device for keeping hogs free from lice, and their skin and hair in good condition. Make it of concrete, 16 inches deep, 8 feet wide and from 10 feet up in length, long enough to hold at one time one-fourth of the hogs that run together. Slope the ends so that the hogs can easily walk into it. Fill it to a depth of 12 inches with water. Add a small quantity of crude oil. The oil will spread over all the surface of the water.

Hogs will bathe 6 to 12 times a day in this bath in hot weather. The oil will kill the lice and make the skin and hair glossy and healthy. Put a 4-inch drain in one corner of the bath, stopping the opening with a soft wood plug, wrapped in an old sack. Once a week drain and clean the bath and refill it.—H. M. Cottrell, Tennessee Bureau of Farm Development.

TEST YOUR SEED CORN

"Testing seed corn is always a wise precatuion," said Mr. Carl Vrooman, Assistant Secretary of Agriculture, "but this year it is a necessary one. Every farmer should test his seed this spring by the individual ear test. No matter how much confidence you have in the man you buy seed from, make a test and know for yourself that the seed is good. If the seed is not good, you can get some other that is.

"A number of seed men who have well constructed seed houses report that they find the early picked seed tests very satisfactorily, but the seed picked later, even if properly dried, is very unsatisfactory. One test in Northeastern Nebraska showed 90 per cent of the early field-picked seed to be good while only 68 per cent of the crib-selected seed germinated. In many sections of Northern Iowa and Illinois the percentage of good seed is much lower, even when the seed was picked before frost and properly dried, while seed picked from the wagon at husking time, or fro m the crib is practically worthless as seed. One reason for this is that many farmers in this section are raising corn of a very large variety which requires a full growing season, and this corn did not ripen before the early frosts.

"Under these circumstances, testing each ear is simply good insurance. One ear of corn will produce about five bushels—if all the grains grow. With corn at 60 cents a bushel, planting a dead ear or an ear that will produce only weak unproductive stalks, means a loss of $3. If you catch only one bad ear, your testing has paid you a good day's wages. If you catch the average number, you've saved a week's pay in a winter afternoon."

Fair Appropriations for Shorthorns

The extent of appropriations for 1916 which the American Shorthorn Breeders' Association has made for the state and district fairs and expositions in all parts of the United States should lead to an increase in the entries. The aggregate appropriation is far in excess of any previous amount set aside for this purpose. At fifteen of the principle state fairs, the Association offers $1 for every $2 offered by the fair association up to $750 offered by the Shorthorn society. At 27 interstate and district fairs the same ratio is maintained up to a maximum of $500. The aggregate offered at the International, American Royal and the Pacific International (Portland) is $12,500. In the futurity calf classes alone at the Iowa and Ohio state fairs, the American Royal and the International $7000 is guaranteed by the Association.

In addition to these awards, silver trophies are offered at a number of the fairs and shows to breeders who have not previously shown at the state fair or national show. The Association will also cooperate in a material way with district and state breeders association holding shows in connection with public Shorthorn sales.

The plan worked out by the Association offers an inducement to beginners and small breeders to enter the shows. It is designed not only to stimulate the efforts of every breeder to attain a higher standard of Shorthorns, but to safeguard the venture as well.

Nations Mortgaged to Pay War's Cost

"The national debts of England, France and Germany are now equal to from one-tenth to one-sixth of the total wealth of these nations, and the interest charges on the debts are appreciable portions of the entire income of the nations," declared President C. R. Van Hise of the University of Wisconsin in an address at the convention of the National Association of Credit Men in Chicago last week.

The national debts of the three countries at the end of 1915, according to his figures, are: United Kingdom, $10,419,000,000; Germany, $7,275,000,000; France, $10,514,000,000. The annual interest charge upon these debts is about as follows: United Kingdom, $521,000,000; Germany, $364,000,000; France, $526,000,000. The total wealth and incomes of the nations are about as follows: United Kingdom, wealth, ninety billion, income twelve and a quarter billion; Germany, wealth, eighty billion, income ten and a half billion; France, wealth, sixty-five billion, income seven and a half billion.

"The magnitude of these debts will be appreciated when it is recalled that the debt of the United States after the civil war, at that time the most colossal debt of any nation, was $2,758,000,000."

These unexampled debts and the industrial and regulatory measures which have accompanied the war will result, Dr. Van Hise declared, in a social transformation in Europe following the war at a speed never before approached.

What Our Readers Say

Samuel Yos, Sullivan County: "Our school districts are beginning to organize and soon we expect to organize Sullivan County. Please send me a lot more literature and a lot of sample copies. Your paper is doing the work."

H. A. Christianson, Laclede County: "Please send Farm Club literature. Have carefully studied your plan of organizing farmers and agree with you. It seems to me it would be wise to establish one packing house in the state strong enough financially to withstand the battle—and for me, I am ready to take shares."

SILAGE FOR HORSES

In planting corn and building silos this year probably more farmers than ever before are providing a silage supply for horses. The old feeling that silage was good for dairy cows only was long discarded, but the horse is perhaps the last more important animal on the farm to prove that it could make good use of silage. While especial care must be taken not to use moldy or other inferior silage or to depend too eclusively on silage, the recent tests of the Missouri Agricultural Experiment Station and long experience of a few farmers and horsemen, indicate that cost of up-keep can be reduced and a horse kept in better condition if from 5 to 25 pounds of silage are fed per day. Of course, the possibility of saving depends on the conditions and prices of other feeds and the amount to be fed depends upon the same things and upon the size of the horse and the amount of silage he will eat. Different horses of the same size vary on this point.

In the tests at the Missouri Experiment Station, silage was fed as part of the ration during the last two winters with favorable results, except in case of one three-year-old Percheron mare which refused the silage at first, then ate it when her feed was reduced, but soon after had to be taken out of the experiment because of distemper and indigestion. The horses that received silage were more thrifty, and their coats were in better condition, and cost less to feed than those which were fed non-silage rations.

One of the breeders, with whom the college has kept in touch, has been feeding silage to about 100 draft horses for twenty-five years without any sickness which he thinks could be directly charged to silage. During the breeding season he feeds silage to the mares as usual but gives none to the stallion, because he had difficulty in getting the mares in foal when the stallion was fed on silage. At other times he feeds eight pounds of silage at each of the three feeds per day to his aged stallions in addition to some hay and grain. His two-year-old stallions get 20 pounds of silage a day, and the yearlings about 15 pounds in addition to some hay and grain, while the mares with foals at side receive 20 pounds. At weaning time this amount is divided and about 15 pounds is given to the mare and 5 pounds to the colt, which is given more as it grows and becomes accustomed to this feed until at a year old he is getting 15 pounds of silage a day.

One importing firm has fed silage for five years following about the methods just outlined and reports excellent results and a reduction in the need for veterinary services.

Some of the horsemen who have fed inferior silage have not had such uniformly good results, but it is a poor plan to give a horse moldy or rotten food of any kind. Silage that has been frozen or that was made from immature corn is regarded with suspicion. Some owners have thought that their horses had died as a result of being fed such silage, and while the Station has not been able to learn definitely that silage was the cause of death in these cases or find out exactly how the supposed poison acted, it is well to take every precaution.

As silage is low in dry matter and the horse has not sufficient digestive capacity to live entirely on such bulky feed, it is important to remember to use alfalfa, cowpeas, or other legume hay, or perhaps even a little grain for horses that are not at work, while growing horses, or horses at light work should certainly have grain.

—E. H. Hughes, Missouri Agricultural College.

Col. P. M. Gross—Successful Live Stock Auctioneer

In another column on this page Col. P. M. Gross the popular auctioneer of Macon, Mo., takes the opportunity to thank his many patrons who have made his first year in the pure bred live stock game, so successful.

Perhaps no man who has entered the ranks of the auctioneer has met with a more hearty reception than Col. Gross. For a number of years

Col. Gross sold horses on the St. Louis market and his work there attracted so much attention that his services were engaged for the Chicago and St. Joseph markets and for a considerabl time he sold two days each week on the three markets. Naturally such a schedule was entirely too strenuous even for a man put up along the massive lines of the Colonel, and when his many friends began asking and insisting that he conduct their public sales, he decided to give up his market connections and devote his entire time to the public sale business. Many friends predicted that the Colonel was making a grave mistake, but a glance at his first years business shows a total of 87 sales, and in addition, Col. Gross sold all the fat and feeder cattle and hogs that were sold at the St. Joseph Kansas City and Denver live stock shows.

Whenever any man makes a marked success in any line we are prone to ask the reason. To begin with, Col. Gross is a natural auctioneer—by that we do not mean that he could do nothing else, but that he is better fitted for an auctioneer than for any other line. Auctioneers like poets, are born—not made, and after seeing Col. Gross conduct a sale one finds it hard to imagine him in any other work. A powerful physique, commanding presence, a pleasing personality, and a keen judge of human nature, coupled with wide experience gained in the hardest school in the world—the horse market, a student of values with few equals, are perhaps the most apparent reasons for Col. Gross' success.

It will be noticed in the advertisement that about one-half of the available dates for the coming season are taken and in view of this fact it will be to the interest of any of our readers contemplating holding a public sale to communicate with Col. Gross as soon as possible.

"Worse Than Cholera"

Scours in pigs is declared by one of Nebraska's prominent hog raisers to be more destructive to the swine industry of the state than hog cholera. The causes are overfeeding, change in feed, decayed feed, lack of exercise, or dirty water. Sometimes filth in pens and bedding is an additional cause when it is taken into the pig's system from the sow's udder or from the navel. The College of Agriculture says that the correction of these conditions is the first measure to be adopted, and that in case scouring has started, the sow's feed should be cut down to a small amount of oats or bran. When the trouble is corrected, the ration should be increased fairly gradually. One great advantage of using metal or concrete feeding troughs is that they are so much easier kept clean and sanitary and in many instances the saving of young pigs from this source would more than pay, for the cost of the troughs. Changing the feeding place often and feeding the pigs on the grass is a good thing for the pigs and good for the land.

LOOK IT OVER

My First Year's Work in the Pure Bred Business

I want to thank my friends who gave me their sales in this my FIRST year in the PURE BRED BUSINESS. I quit selling horses on the ST. LOUIS MARKET Jan. 1915, where I had been for 9 years, (leaving a salary of $6,000.00 a year for two days work in each week), to take up the selling of PURE BRED LIVE STOCK. And aside from selling ALL the FAT AND FEEDER CATTLE AND HOGS that were sold at THE FAT STOCK SHOWS held at KANSAS CITY, ST. JOE, and DENVER, I sold for the following BREEDERS:

	Sales
H. L. Faulkner, Jamesport, Mo.	3

I have my booking for the coming season about one-half filled. And to ALL INTERESTED PARTIES CONTEMPLATING SALES, I refer you to the above patrons. WRITE FOR A DATE. Yours Very Truly,

P. M. GROSS, Macon, Mo.

PRINCE ALBERT

the national joy smoke

makes you want to fire up your old jimmy pipe!

Copyright 1916 by R. J. Reynolds Tobacco Co.

PRINCE ALBERT tobacco throws open the gates to *every* man fond of a pipe or a makin's cigarette—*it's so friendly!* Just makes smoke joy possible for all degrees of tender tongues and tastes! The patented process cuts out bite and parch! And you can't get better proof than the fact that Prince Albert is today smoked not only throughout the United States, *but all over the world!*

First thing you do next, locate that old jimmy pipe or the makin's papers; invest 5c or 10c for a supply of P. A. And fall to like you are on the right track. For Prince Albert is better than the kindest word we ever have said about it. And you'll find that's a fact!

You can buy Prince Albert everywhere in the toppy red bag, 5c; or the tidy red tin, 10c; in pound or half-pound tin humidors or in the handsome crystal-glass pound humidor with sponge-moistener top that keeps P. A. fit-as-a-thoroughbred!

On the reverse side of this tidy red tin you will read: "Process Patented July 30th, 1907," which has made *three* men smoke pipes where *one* smoked before!

BETTER FARMING BETTER FARM HOMES BETTER CITIZENSHIP

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

Day Dreams

There is no season of the year so full of promise and inspiration as the Spring time when every tiny blade of grass and every budding flower proclaim that there is in truth a Resurrection and that the victory of the bleak days of November is only temporary—that sometime, somewhere there will sound a trumpet blast which will call to life again the smiles and laughter which made the whole World glad in the shrouded yesterdays—that sometime, somewhere there will be a Spring time when all of us will be young once more and when once again we will join hands and sing "King William was King Jamese's son" as in those sweet lilac scented days of old when youth danced in every eye, when every hour was golden and when the whole World seemed glad—so glad! It is in this glorious Spring time that sweet throated birds send up their joyous melody from every hedge and fragrant wildwood and when the little wild things of the forest frisk and play unafraid—when the quail calls in love notes to its mate and when the thoughts and hearts of men linger close to the foot of the Cross—when we realize that somehow we are in truth "our brother's keeper"—when all nature sings "Come play with me" and everything breaths of love and hope and tenderness.

These are the days when the farmer boy dreams "Day Dreams" and when, as he plods across the fields, he plans the great things he hopes to accomplish in the years to come when he shall have assumed a man's responsibility among the affairs of men. I've been there my boy and I envy you—and envying you I say "dream on!"—for out of the day dreams of farmer boys in years gone by have come some of the most splendid and beautiful realities the World has ever known. Rear your castles until they touch the foamy clouds that drift like ice bergs through the azure depths above—and then, as the years roll on, try to make the structure as firm as the everlasting hills that lift their heads on yonder heights through the shimmering rays of the noon day sun. Possibly time will crumble them somewhat. Possibly there will be fewer turrets as the man's calmer vision takes the place of the vision of boyhood. Perhaps no courtiers will do you homage and there may be no heralds to announce your coming on the great day as you see it now. Possibly they will not lower the draw bridges as, in fancy's eye you sit like a plumed knight upon a prancing charger and shout commands. But, at any rate my boy you will be the richer and stronger for having dreamed—and who knows—who knows but the dreams may come true?

Plodding behind the plow or cultivator today is many an humble farmer boy who is destined to play a big man's part in the affairs of men. Whether he shall be the proud master of fine flocks and herds—and more worthy ambition there is none—or whether his hand shall guide the ship of state, direct great industrial enterprises or write or paint an immortal thing—these are secrets hidden away in the vaults of the future and time alone can unlock them. But remember my boy that the world's eye is upon you and that its future masters will be chosen from among your ranks—for destiny loves to lead the humble to seats of power and rarely ever knocks at the door of those who bask in affluence and luxury. Thus it found little barefooted and motherless Abraham Lincoln playing around a little log cabin in the backwoods of Kentucky and even so the kindly stars watched over James A. Garfield as he rode an old tow boat mule up in Ohio and helped earn a living for his widowed mother. Thus it smiled upon Thomas A. Edison whose genius shines around the world. So dream on boy!—but turn an even furrow as you go, for in building air castles as well as material things, everything depends on the foundation. Despite what others say the world is very beautiful and filled to overflowing with opportunity for those whose hearts and minds are clean and who do well the humble tasks of today to the end that they may become the stronger for those of tomorrow. Some day—who knows—your dream of today may stand before you a splendid, living realization.

For Greatest Satisfaction Use
DOUBLE SERVICE Automobile Tires
Guaranteed 7,000 Miles Service
Absolutely Punctureproof

Double Service Tires are made double the thickness of the best standard make tires.

This 100% greater wearing surface naturally gives that much more mileage and service. The average of 12 miles of tough fabric and one inch surface tread rubber makes these tires *absolutely punctureproof*.

These tires excel all others for use in the country over rough and rugged roads as well as on hard pavements. They are as easy riding and resilient as any other pneumatic tire—the air space and pressure being the same.

They are the *most economical* and "care free" tires made and are used where tires must be depended on and tire troubles cannot be tolerated. Many *Double Service* style tires are in use in the U. S. government and European War service.

Our output is limited to a certain amount, but for a short time we offer the following reduced special prices as an Introductory Offer:

PRICES

	Tires	Tubes		Tires	Tubes
30x3 in.	$ 8.60	$2.30	36x4 in.	$17.45	$4.65
30x3½ in.	10.85	3.10	35x4½ in.	21.20	5.60
32x3½ in.	12.75	3.20	36x4½ in.	22.50	5.75
33x4 in.	15.75	4.20	37x4½ in.	23.60	6.20
34x4 in.	16.70	4.35	37x5 in.	26.30	6.60

All other sizes not included in above list also furnished. Non-skids at 10% additional.

Terms: Payment with order at above special prices, a 10% discount allowed on orders for two or more tires. All personal checks must be certified.

Try these tires now and be convinced of their very high qualities. Sold direct to the consumer only.

Descriptive folder upon request. Write for it.

ABOUT THIS AND THAT

May-Time in Missouri

May-Time in Missouri—rich in duty and in beauty—the mystic month of the curious calendar of hopes and fears in the links of life throughout the years—such is Missouri in May-Time, the historic home of happiness and hospitality!

May-Days test and try both the souls and soles of men and manikins. What the season means depends so much on practicing what we preach—plowing not too wet, too shallow, nor too deep—seeding aright, farming with brain and brawn through a right rotation!—Jewell Mayes.

Land Prices Up—Fertility Down

Yes son, land prices are up, fertility is down, farm tenancy is on the increase. If you paid $20 an acre for your farm forty years ago, maybe it is worth on the market $100 an acre now and only two-thirds as fertile as forty years ago! Suppose it took you fifteen years to pay for it. If your boy farms just as well as you did, it will take him then just seventy-five years to pay for it. Or if he pays for it in the same time you did, he must make five blades of grass grow where you grew one, five ears of corn grow where you grew one, or he must (in other words) make five dollars clear profit for every one dollar clear profit you made. Do you think he can do it? Could you do it yourself?

Do you want to see the people own their farms, or would you prefer that they be tenants under a landlord system? If this would not suit your ideas would it not seem wise that you take every possible step to counteract this condition that is surely on the way at this time?

Do you know how best to combat the insect enemies that so badly menace our growing crops and take their toll of millions a year?

Do you know the history and life habits of our worst pests? If you do not, how would you combat them successfully? Do you know, by the way your crops behave, what sort of fertilizer your crops need? If not, what analysis of fertilizer would you use?

If you are not keeping up the fertility of your land, is it because you do not know how to do that? If your boy doesn't know how to rebuild the soil that you have run down by wrong methods, how do you expect he can make his crops increase enough to meet the increased price of land?—Sam Jordan.

SPECULATION AND UNTILLED ACREAGE

A report on file in the Office of Farm Management tells of delayed agricultural development along a certain railroad in a Western State. For a long distance the railroad traverses a belt of level and fertile but undeveloped prairie land. Less desirable land at a distance of 8 to 10 miles back from the railroad is quite well developed and producing fair crops. At first it seemed very strange that the most fertile and best located land should be the slowest to develop. Further investigation disclosed the fact that the undeveloped land was owned by speculators and held at prices that made its development practically prohibitive. In a more limited way these conditions are found in all the new agricultural sections. Land speculators have not only greatly inflated the prices of land but they are today holding a tremendous area out of production altogether. The unearned increment may eventually enrich the present owners, but to the general public these acres are all unprofitable. How to discourage excessive land speculation is a problem that is now puzzling many of the wisest men in our legislative essemblies. The solution of this problem would materially decrease one source of unprofitable acres in this country.

In the suburbs of nearly every city there is a considerable area of rich agricultural land that has been cut up into city lots and sold at prices that prevent its profitable use for agricultural purposes. Such land is held for speculation and for many years it may serve no useful purpose whatever. In fact, these vacant lots are often badly kept, unsightly, and a menace to the health of the community. It would undoubtedly have been better if this land could have been left in farms until such time as it may be needed for building purposes. The area of each lot is small, but the total area of such unprofitable land is very great.

How to prevent this misuse and waste of good agricultural land that is so well located is not an easy problem. Vacant city lots are being used to encourage vegetable gardening in connection with boys' and girls' club work. This undertaking is meeting with some success, but by far the greater part of such land can never be used in this way.

We hear much comment about the great profits that are sometimes made by holding idle land for rise in price. The cost of holding this land is usually overlooked. Taxes and a fair rate of interest on the investment take a big slice of the unearned increment, and often unimproved city property is actually held at a loss. Not infrequently the present owners and possibly the general public would have been the gainers if unused suburban lots had been left in farms. In dividing rich agricultural land into city lots the desire to get something for nothing has added materially to the total number of unprofitable acres.

A considerable perecentage of our unprofitable land doubtless never can be brought under successful cultivation by any methods now known. It is also true that the sudden advancement of all our arable land to a point where each farm would become 100 per cent efficient might seriously affect the business side of farming by lowering the prices of agricultural products. Yet as population increases all classes of people will undoubtedly be benefited if the rapidly rising price of farm products can be met at least in part by setting idle acres to work and by making unprofitable acres yield a satisfactory income.

To meet the growing demand for farm products we must farm more acres or make each acre produce more. Land not now in farms should be made into farms, and unimproved land now in farms should be improved, only in so far as this can be done profitably.—J. C. McDowell, Office of Farm Management, in U. S. Department of Agriculture Yearbook.

Why not get your neighbors together and talk ever the organization of a breeding club. Five men with 10 cows each can afford to buy a much better bull or boar by acting together and the expense of keep will be less.

BUY NOW! ONLY 30 DAYS MORE!

If you want to take advantage of my special 90-day proposition and buy Galloway Spreaders, Cream Separators or Gasoline Engines at the lowest prices they've ever been offered **you must act quickly.** 30 days are **all you have left.** May 31st is positively the last day. I repeat the offer briefly. For a **limited** time—until May 31st—I am making a special proposition to the first ten or more men in each township, as a **special advertising proposition.**

10,000 GALLOWAY ENGINES

Galloway engines are so far ahead of other engines that one invariably sells from two to six more in each neighborhood. For that reason I can afford to CUT THE PRICE of the FIRST TEN INTRODUCTORY ENGINES sold because of the great number THEY will sell. I'm doing the GREATEST ENGINE BUSINESS in the country. But I'm not satisfied. I want to treble it. I want to sell 10,000 ENGINES during the 90 days up to May 31st, and I have taken THIS WAY of doing it.

10,000 GALLOWAY SANITARY CREAM SEPARATORS

What I have said of my engines also applies to my Sanitary Cream Separators. YEAR BY YEAR my cream separator business has GROWN BY LEAPS AND BOUNDS. I've SAVED farmers MONEY and in return they've TOLD THEIR FRIENDS. Those friends have BOUGHT, SAVED MONEY and told their friends until my separator business has reached the point WHERE IT IS ENORMOUS. If you are not acquainted with the Galloway separator, send for my free catalog. Read it over. Then order one of these machines BEFORE MY 90-DAY OFFER EXPIRES.

10,000 GALLOWAY MANURE SPREADERS

I have also included my New No. 8 LOW DOWN Manure Spreader in this 90-day offer. Even at the regular price this spreader is WORTH $55 MORE than any other spreader made. Note these features: All-steel beater and V-Bar; positive roller feed; patented automatic push board; double chain drive; cut-under front trucks and pressed steel unbreakable tongue. It has no equal at any price. Order one on trial.

5 LIBERAL BUYING PLANS

I will sell on terms to suit you—all cash, half cash and half note, bank deposit, full note settlement or on the installment plan.

GET THIS BIG NEW 1916 FREE BOOK

In time to take advantage of our cut price offer. It tells all about Galloway engines, separators and manure spreaders. It shows why THEY ARE SUPERIOR to others and also how we can give you BETTER MERCHANDISE and still save you from 10 to 20 per cent, not only on farm machinery but on clothing and house furnishings as well.

OLUME VIII | MAY 1, 1916 | NUMBER 9

Combatting The Packers' Combine

By Geo. B. Ellis, Managing Editor

The alarm that The Missouri Farmer ounded several months ago about the ctopus; "The Packers Combine," hich has been squeezing the very life ood out of the producers of meat ani- als has at last reached the halls of ongress and that great body is likely throw on the search light of investi- ation which will let us know just to hat extent the few great packers do prices and control the live stock arkets of this country. But after we et the facts what are we going to do out it? In the light of our past ex- eriences with great combinations of pital we can not hope for much re- ef unless the meat producers, great d small, stand together and try to lopt better economic methods in the lling and slaughtering of meat pro- cing animals. It is only by the loption of better methods that we n destroy the opportunity the pack- s now have to control prices.

Must Maintain Fair Competition

In the first place the State and Fed- al governments must pass iron clad ws that will shut out the unfair com- etition that big business like the andard Oil and the big packers have lopted in the past to kill off the com- etition of the small independent deal- s. Without such laws are enacted nd honestly enforced to the letter here can be no hope for the thousands f small cooperative or independent lants which otherwise would do a rge part of the business of killing nd selling meats.

A number of our readers have re- onded to the suggestion that the rmers of Missouri subscribe stock the amount of $2,000,000, to $5,000,- 00 for the inauguration of a farmers' operative packing house in one or ore of our great live stock markets nd while this plan is all right in eory it will take much time and ork on the part of some one to get e necessary capital subscribed. Then ter the capital is assured it will not an easy task to find the men of perience and necessary skill and siness acumen to handle the plant ccessfully. So while we are waiting r these larger ways of breaking the ckers' hold on the prices of our gs, sheep, cattle, poultry, eggs, but- r, etc., let us lend our influence and e our money and our votes to help the many smaller ways that are ssible to most every county in any the live stock states.

The City-Owned Plant

The plan we want to suggest as one the first steps farmers and the peo- e of our small cities should unite putting into operation is the co- erative or municipal abattoir and in is article we will confine our story the municipal plant only. We say e people of the cities should be in- rested because under the present or- er of things the consumer gets very ttle benefit from any lowering of prices of live stock and in order to get away from the grip of great combina- tions we must make our methods of distribution as short and simple as it is possible. Can any reader give an intelligent reason for the present methods of marketing our hogs and cattle? Why should the beef con- sumed in any of the towns of this state be sold to a local buyer who takes out commision No. 1; then the railroad takes out commission No. 2; the commission man gets No. 3; Stock Yards charges No. 4; Mr. Packer No. 5; traveling salesman No. 6; railroads, transportation back home No. 7; the drayman No. 8; and the retailer No. 9. A more expensive system of market- ing could hardly be devised and yet this is the route by which nearly all the meat consumed in our towns and cities travels from producer to con- sumer.

Old Style a Menace to Health

The old style country slaughter house was the most filthy, disease- breeding place imaginable and when the packers drove the local butchers out of business there was none to mourn the loss because it was thought the chief nuisance of the town had been abated. But when we see the cost of the new system we are won- dering if a better way could not have been found without paying so dearly for it. The better way is the muni- cipal abattoir where all the cattle, hogs and sheep needed to supply the local market can be slaughtered and cured under just as good sanitary conditions as are maintained in the largest plants.

As an example of what may be done by a municipal abattoir in a small way we will give an account of what has been accomplished at Paris, Texas a city of only 15,000 people where so far as we know the first municipal abattoir to be established in the United States was erected in 1909 and has since been successfully operated. The information upon which this story is based is furnished the writer by the Honorable Mayor of Paris, E. M. Mc- Cuistion, who may very appropriately be called the father of this idea in America. Mr. McCuistion has been mayor of his city for 10 years which shows that he is a progressive and public spirited statesman worthy of emulation by the officers of other cities.

What One City Has Done

Paris is much like the average city, situated in the cotton belt of Texas. Prior to 1909 there were a number of private slaughter houses, most of them poorly constructed, located on low, damp ground and usually the only water available was from stagnant pools or shallow wells. All the condi- tions under which the city's meat sup- ply was slaughtered were extremely unsanitary. First, efforts were made to induce the local butchers to com- bine and form a stock company to build and operate a modern plant un- der city inspection, but business rival- ries were stronger than the welfare of the city. Finally, the mayor desparing of bettering conditions any other way developed plans for a modern abattoir, cold storage and rendering plant. A bond issue of $10,000 was authorized by popular vote and the city promptly erected the plant which is shown in the accompanying picture.

The abattoir is located on one of the principal streets of the city, with dwelling houses on all sides and with- out any inconvenience or menace to health. The buildings are constructed of wood and corrugated iron except foundations and floors which are of concrete.

Immediately adjacent to the build- ings are stock pens, scales and run- ways for handling stock. The plant has facilities for handling about 50 head of cattle in a day of 10 hours and half as many hogs or sheep. For the year from July 1, 1913 to June 30, 1914, the plant killed 1881 cattle, 2053 hogs, 305 calves and 110 sheep. The charges for killing, including four days storage for cooling out the dress- ed meat are $1.25 a head for cattle, and 75 cents a head for hogs, sheep and calves up to 350 pounds live weight. This is about as low as the butchers could do the work themselves and then they have the services of an inspector and they know that they are handling only meat from healthy ani- mals. The carcasses are delivered to the meat shop which makes the most direct marketing system we could de- vise. Up to this time, killing has been done for butchers only, but it is now planned to enlarge the plant so that farmers may have the benefit of its advantages. When packing and can- ning facilities are added "the farmer can then bring in his hogs just as the butcher does now," says Mayor Mc- Cuistion. "We will slaughter and cure for him, he can carry back home the brains, liver, ribs and other fresh pieces he wants for home use or to sell to his own customers and also his lard. We can cure or can his meat in any style he wants it."

All Animals Are Inspected

A thorough system of inspection is maintained by the city, thus insuring the consuming public against the con- sumption of unwholesome meats. The cheif inspector is a graduate veterina- rian who has had a special course of instruction under skilled government inspectors. Two inspections are made, one before and one after slaughtering. The rules of inspection are the same as are used by the United States gov- ernment inspectors in the packing houses. If animals are rejected on live inspection, the owners are noti- fied and must take the animals from the pens. If the rejection is made in the killing room the carcass is "tanked and the owner is allowed what it is worth in tallow and tankage. The in- spector is the chief employee and must make daily reports to the City Secre- tary who keeps all accounts. The other employees are a city engineer, two slaughterers, one driver and one dead stock man.

The products of the reduction plant are tallow and tankage. The odors from the reduction plant which are not condensed and trapped into the sewers go under the fire-box of the boiler and are consumed there.

"We have never undertaken any en- terprise," says Mayor McCuistion, "which has commended itself to our people so strongly as our abattoir and reduction plant. When we undertook to vote bonds for it there was quite a good deal of opposition among our people. Both the plant and the plan were considered impractical and vis- ionary, but there is not now, so far as I know, a single dissenting voice, and our people appreciate it more than any improvement we have ever under- taken."

This may look like a small way to fight a big combination with millions of capital but suppose 50 of the best counties of Missouri would operate such a plant? And then if 20 of the best live stock states would do the same thing—1000 plants, each handling 2000 cattle and as many hogs—we would take from the packers and give to the local communities the profits on 400,000 cattle and hogs and restore just that much legitimate competition.

View of Municipal Abattoir, Paris Texas, built by the city at a cost of $10,000 and operated entirely under city supervision. The charges for slaughtering ani- mals including the cooling of the meat for four days are $1.25 a head for cattle and 75 cents a head for calves, sheep and hogs.

SOME COSTLY EXPERIENCE

The Missouri Farmer:

I regret to say there are too many of us farmers who are like that fellow who wrote he could get along without anybody's advice in running his farm. It has taken a long time to convince me that I have got to grow clover to keep up my farm and I have been farming almost thirty years on the old home farm. I have had a lot of experience and a living but that is about all.

I see you are giving the hog a prominent place in your most valuable paper and I want to relate some costly experience that may save some one else a loss from the same cause that I suffered. I thought I knew the hog business from A to Z but I am still learning.

Last week I had four sows three Red and one Poland, the four sows having 33 pigs. The pigs were a little over two months old, averaging around 50 pounds and were a fine lot indeed. They were just learning to eat shorts, oil meal and corn chops which I fed dry in a shallow trough. I fed milk slop also. There were with these another lot of 16, some weeks older which had fish-hook rings in their noses. They had a fine blue grass and white clover pasture of 25 acres with clear running water to drink. On Sunday morning, April 23, I turned them into a lot of ten acres just broken up this spring. I thought the change would be good for them as there was wild lettuce and blue grass all around the fences. About six o'clock Sunday afternoon when I went to feed them I noticed three pigs in their bed did not get up to eat. They were just gasping for breath like as if they had been lain on by the others. These three soon died with convulsions and apparently awful pains. Next morning I found eleven more dead, fourteen in all.

I had changed them all back Sunday evening to their usual quarters and they had eaten as if nothing was the matter. Monday morning I started out to investigate and around where an old straw stack had been I found where the pigs had been feasting on cockle burs. We had just harrowed the ground on Saturday but had not destroyed all these young burs. I dissected nine of the pigs and found the same condition in all: Eyes blood shot, bleeding at mouth, stomachs distended with green food. One litter of 10, the youngest bunch escaped entirely. The 16 older pigs that were weaned had access to this field every day but they escaped also. Now this proves to me that Sam Jordan was right when he said, "We never get too old to learn from experience or from the other fellow." I am giving these facts that my loss may save some one else the same kind of loss. I made a hard fight on the burs last year, but I have a few left which I am sorry to confess.

W. T. Davis,
Easton, Mo.

Occasionally a report is received of loss of hogs from eating cockle burs but it is only remarkable that the losses from this cause are not many times greater when we consider how wide spread the burs are. Whether the burs kill from a poison or from the irritation and impaction of the burs in the pigs stomach is not fully determined but as Mr. Davis has found out they will kill and do it quickly. It appears from all the reports we have ever received that the only time of danger is when the burs are just coming up and in picking off the tender shoots the pigs get the old bur which is on top of the young plant. It is for this reason no doubt that we do not have much greater loss from this cause. Hogs may sometimes run in a field infested with burs without any trouble but it is probably due to the failure of the hogs to eat the burs.

The only remedy in this as in many other fatal troubles is prevention and in this case that means either to rid the farm of burs or to keep the hogs out of bur-infested fields at the time when the burs are coming through the ground. We have never heard of trouble caused by hogs eating the plants after the old bur drops off.—Editor.

QUALITY IN CORN

Quality is one of the most important factors to be considered in raising corn, as both the market value and the feeding value of the crop is based upon it.

Last year, a large portion of the corn raised in the Central States was of a very poor grade. The weather was partly responsible for this, but improper cultural methods on the part of the farmer were also largely to blame. In many localities, the weather was responsible for failure to obtain early stands, necessitating second plantings; it was also to blame for considerable corn that was greatly devitilized owing to a cold, cloudy growing season at the start. In spite of bad weather, if the majority of farmers had practiced methods which would have tended to offset such conditions, the loss would have been small as compared to what it was.

In many fields, poor stands were due to a lack of proper drainage. In fields of this kind, one of the best investments a farmer can make is to put in a good tile drainage system. This would serve as insurance against standing water on the fields for any great length of time during wet weather. Cases are common where the corn crop has been doubled and even trebled after a good drainage system has been put in a field.

Sour soils are responsible for a great deal of poor corn, and if this condition exists it should be corrected by liming.

One of the most important factors that has a large share to do with the control of the quality of the corn is the seed that is used. The practice of selecting the seed corn from the crib is a poor one. All seed ears should be tested for germination, good quality and those showing poor vitality should be discarded.

The variety of corn that is grown is another point that very often plays a prominent part in determining the quality of the crop. Only those that are known to do well in the locality should be planted. Much of the soft corn that was harvested last year was due to the planting of varieties that were too late in maturing.

Liberal supplies of the various plant food elements are of absolute necessity for the production of large, high quality yields of corn. If the soil lacks in fertility, the addition of plant food in some available form is one of the wisest and most profitable investments a farmer can make. One of the best ways to do this is through the liberal application of some high-grade commercial fertilizer. This will supply amounts of plant food which the plant can easily use, and will give the crop that early and vigorous start which is so essential to a good yield.

Cultivation also plays its share in shaping the future of the crop. The lack of proper cultivation has been the means of ruining hundreds of corn crops that would have been good otherwise. To keep the moisture in the ground for the use of the growing corn, means a continuous, vigorous growth, provided other conditions are right. Frequent, shallow cultivation will not only keep the moisture in the ground through the formation of a surface mulch, but will also destroy the weeds, increase aeration and improve the physical condition of the soil.—F. D. Lewis.

TO CUT THE COST OF LIVING

To The Missouri Farmer:

The other day when I had to pay 8 cents a pound for white sugar I thought it was high time to find a substitute for a part of the big sugar bill of Missouri farmers. Dr. Wiley says white granulated sugar is not a pure food and if it was not such a popular and universally used article that it would come under the ban of the pure food laws.

Why not compete with the "Sugar Trust" and cut the cost of living by returning to a simple life and do as many of us did 30 to 40 years ago when most every farmer raised a patch of sorghum cane and made a barrel of molasses. What better breakfast could you desire than buckwheat cakes and home-made sorghum molasses. Maybe you could mix with it, for variety sake, nice fried ham and red gravy and good, sweet country made butter. I do not want the store-variety of sorghum made of corn juice and glucose and thinly flavored with sorghum but give me the genuine, pure and nutritious article.

Forty years ago there were few families who did not consume a barrel of sorghum in a year and instead of using white sugar, the brown or "C" sugar was the everyday variety with granulated sugar for company. We are eating and dressing too much on looks in these strenuous times and it would be better for us all if we would consider our health and comfort of first importance. Is it not specially important that we do this if we at the same time can profit by it?

Oh, there was some fun and a lot of work in those good old days when sorghum making time came around. Every time we went to the corn patch to cut and strip the stalks father would tell us how his father first introduced sorghum growing into the neighborhood. By sending $3 to a New York weekly paper for one year's subscription he got for a premium a pound of sorghum seed. They had a maple sugar camp on the farm and so with the big sugar kettles they could boil the juice and manufacture the molasses, but how were they to get the juice out of the stalks? Well to do that a cane-mill was made of large wooden rollers, two of them, made with a crank on each end and one stalk at a time was ground between the rollers and the juice pressed out. This, I imagine was a very wasteful method compared with our present day mills. It was wasteful in both time and material because there was much juice left in the stalks whereas with one of our modern mills the ground stalks, bagasse, are most dry enough to burn.

From the one pound of seed they raised enough to make 100 gallons of molasses and sold seed the next year at $1 per pound. The second year the cane was ground between great wooden rollers, geared with wooden cogs and a horse hitched to the end of a long sweep did the grinding. (Yes I can almost hear the screaking of the old wooden cane mill now after 50 years since I fed the stalks through three or four at a time.—Editor.)

I can not see why the Department of Agriculture does not keep some of the scientists at work trying to develop sugar making from sorghum. I suppose some wise head will find out an economic way to make sugar out of sorghum some day. There is no Babcock test of sugar in the plant and we know it only as sorghum, white seed or black seed and very little about its sugar content. I do not know why so many give sorghum a black eye for home use unless it is for want of knowledge of how to handle it.

The crop is not even handled well for making hay as, for instance, a majority of farmers will cut sorghum for hay making in the hot days of August and the result is sour hay. If they would wait until cool weather even if it is ripe it would make good feed and keep well. In this neighborhood, about 80 miles south of Kansas City the time for cutting sorghum is about October 10, when it is cool enough to frost most any night.

Sorghum hay cut with the binder or cut with the old reaper is a fine hay and I find stock do well on it. I would advise farmers to plant a half acre for making molasses for the family and sow the spare ground broadcast and cut the cost of living both for the family and for the cattle and horses.

E. E. Laughlin, Bates County.

FIGHT FIRE BLIGHT NOW

Fire blight has appeared in the orchards this spring and every affected twig or branch should be removed before the disease has a chance to spread. During the last few years this disease has done a great deal of damage in pear and apple orchards and the Missouri Agriculturl Experiment Station finds it appearing again this spring. Its effects are not usually observed by the orchardist until May or June, when many of the fruit clusters and young twigs begin to die suddenly as if they had been scorched by fire. The earlier symptoms which should have warned him to cut back the diseased parts at once are the flow of a gumlike or even a thin saplike liquid

ATTENTION FARM CLUBS

We wish to hear from the President, Secretary or some member of every Farm Club in Missouri on an early mail because we have several matters of pressing importance to communicate—things which will mean the saving of money to your organization. We have no means of knowing how many Farm Clubs have been organized or where to address them. We trust therefore that every reader of The Missouri Farmer who sees this notice and who belongs to a Farm Club will either write us himself or see that the President or Secretary does so without fail on an early mail. We wouldn't make this request if we didn't have worth while reasons for it. Your prompt action means the saving of money perhaps to yourself and certainly to some of your neighbors.

William Hirth, Publisher.

from the bark, or the appearance of beads of honey-like material on the newly formed apples. This material may spread like a soft varnish, covering the fruits instead of remaining in beads.

The only means of checking blight is to cut and burn all the affected parts before the disease is carried to the rest of the orchard by bees and other insects, or has a chance to spread through the twigs themselves. The pruning tools may carry the germs if not carefully disinfected by either dipping them into a 1 to 1000 solution of corrosive sublimate, or wiping them with a rag or sponge which has been dampened with such a solution carried in a small bottle for this purpose. Corrosive sublimate—also called bichloride of mercury—may be purchased at ann drug store in small bottles containing about twenty-five tablets apiece with directions for dissolving these tablets and making solutions of any desired strength.

Pruning tools should be disinfected after pruning each tree so that the disease will not be carried from tree to tree, and should be disinfected still oftener than this to avoid carrying the disease from one part to another of the same tree, as the pruner finds that he is cutting through diseased wood.

The blight usually passes the winter in pear trees, but may live through in Jonathan, Ingram, Yellow Transparent, and similar apple trees.

Orchards affected by blight last year should be very carefully watched now, and pear trees which show blight scars or cankers should be examined first of all. Blisters may form under the bark, then burst after the trees have begun to grow. From these places there flows the honey-like liquid which contains the bacterial germs of blight which bees and other insects are likely to carry from tree to tree. The bees carry these germs to the flower clusters of pears and apples and the newly formed fruits may have the beaded or varnished appearance which indicates that the spurs on which they are growing should be cut and burned at once.

The grower should not wait for the blighted parts to die and turn brown or black. To keep the blight from spreading through the whole orchard it is necessary to find and cut out the few early infections here and there. These early infections may be located by observing fruit clusters where the stems of the fruit look slightly discolored and show the sticky exudations.—J. C. Whitten, Missouri College of Agriculture.

CONTROL OF THE CODLING MOTH

Spray the apple trees immediately after the blossoms or petals fall in order to fill each little calyx cup or cavity with poison. About three-fourths of the codling moth worms which hatch from eggs three or four weeks later enter the apples through this cavity. If we succeed in putting a few grains of arsenic in each little calyx cup, the first meal the apple worm takes will be its last one.

Since the calyx cups stand open for only a week or ten days, the spray must be applied within this time in order to be effective.

Commercial lime sulphur at the rate of 1½ gallons to 50 gallons of water, and arsenate of lead paste at the rate of 2 or 2½ pounds to each 50 gallons of spray mixture should be used.

The trees should not be sprayed while in full bloom. Such work would interfere with pollination, without which fruit cannot set, and destroy the fruit grower's best friend, the honey bee. It is safe to spray when two-thirds of the petals have fallen, because the flow of nectar has practically stopped and few, if any, bees will be injured.

This should be the most thorough and drenching spray of the season. A nozzle throwing a rather coarse driving spray with high pressure should be used in order to force the poison down deep into the calyx cups.

This is the most important single spray of the season. It not only controls the first brood larvae of the codling moth, but it also prevents, to a great extent, the losses occasioned by the later broods of the pest. It is also an important spray in controlling the lesser apple worm, plum curculio, canker worm, apple scab, black rot, and other less important insect pests and fungus diseases.

The next spray should be applied about two or three weeks after the calyx spray. This will be about the time the majority of the first brood codling moth eggs are hatching and if the surface of the leaves and fruit are thickly peppered with the poisonous spray, many of the worms will be killed by feeding slightly before they reach the blossom end of the little apples. Since this is also the first important spray against apple blotch, Bordeaux mixture should be used with the arsenate of lead if this disease is prevalent in the orchard.

About eight or nine weeks after the blossoms or calyx spray the third application should be made, using the same spray chemicals. This is an important spray against the second brood of the codling moth and lesser apple worm, also the plum curculio, apple blotch, and other insect pests and diseases.

Later sprays may be necessary, but under average conditions the work as outlined above, if thoroughly done, should control not only the codling moth but the other more important insect pests and diseases of the orchard. Other spray schedules might be suggested but this is the one which has given the best results in the tests of the Missouri Agricultural Experiment Station.—T. J. Talbert, Missouri College of Agriculture.

VARIATIONS IN THE CREAM TEST

One of the most common causes of dissatisfaction on the part of the man who sells cream on the butter-fat basis, rises from variations in the test. This is especially true if each can is tested separately and the best way for the seller to convince himself that the tester is neither careless nor dishonest is to secure a little outfit for himself. A well made, accurate, and satisfactory tester can now be bought for five dollars and its use will not only satisfy the seller that he is getting honest treatment but will enable him to detect the boarders in his herd. The general interest in this subject is compelling the Missouri Agricultural Experiment Station to reprint a circular for general distribution, but a little discussion of the principal causes of variation in this briefer form may avoid the necessity for so wide a distribution of that circular.

Speed of Separtor — A change in the speed of the separator immediately causes a change in the tests of the cream, the higher the speed the greater the amount of skim-milk thrown out and so the higher the test of the cream secured. Putting it in another way, a low speed results in a larger quantity of thinner cream.

Rate of Inflow.—The use of the float does not always insure a uniform flow of milk into the separator, because the faucet may not always be opened equally wide and the flow will be more rapid when the tank is full than when it is nearly empty. Anything which makes the inflow more rapid will increase the proportion of skim-milk which goes through, and lower the test of the cream secured.

Flushing the Bowl.—The amount of water used in flushing may easily be varied a pint or more and this without any other cause or variation may change the test by two, three, or even four or five per cent.

Variations in the Milk Itself.—The milk of an entire herd may rise or fall in its test from day to day because of excitement or change in the weather. If the milk of a herd, whose average test is four per cent, is ordinarily so separated that the cream tests forty per cent fat, the test will suddenly rise to 42.5 per cent if the milk of the herd is suddenly raised to 4.25 per cent without any change in method of seperating.

Cream Screw. — The test is, of course, readily controlled by means of the cream screw, but as it is seldom changed in this way, on the average farm, there should be no trouble because of variation from this source.

Feed of the Cow. — Variations in cream tests are practically never caused by changes in the feed of the cow as every well informed cream seller is now aware.

Mistakes and Dishonesty.—Mistakes are most likely to result from carelessness in taking samples, as they must be very carefully and skillfully taken if they are to tell the truth and result in a fair payment, but actual dishonesty is probably much rarer than many sellers believe. A clever thief would manipulate the reported test in such a way as not to arouse the suspicion that an honest report sometimes brings up in the mind of the man who does not consider all the possible hiden causes of variation.

C. H. Eckles,
Missouri College of Agriculture.

Build a Concrete Feeding Floor

A CONCRETE feeding floor will soon pay for itself in the saving of feed and manure, the shortening of the time of fattening, the saving of labor and the improved health of the stock.

Concrete feeding floors are never muddy—prevent the feed from being trampled into the mud—cannot harbor disease germs—are easily cleaned—rats cannot nest under them.

Your farm hands can readily build a concrete feeding floor. Sand and pebbles can probably be obtained onyour own farm. Your dealer can supply you with the necessary cement.

A concrete feeding floor is only one of the countless permanent improvements you can build with concrete.

Any one can readily learn to use concrete. We will send simple instructions free. Write for our booklet, **"Concrete Feeding Floors, Barnyard Pavements, and Concrete Walks."**

WHY COUNTRY PEOPLE SEEM DIFFERENT

We frequently hear it said that country people are different from city people. Just the other day I heard a person say "I can tell country people as far as I can see them." While these are manifestly the words of an urban snob, they give expression to a belief that has gained entrance into many minds which are free from snobbery and conceit.

Now it is quite unnecessary to affirm that there is no essential difference between people living in the city and people living in the country, and that there are countless times when the latter cannot be identified upon sight. Not infrequently we hear it remarked that this or that professional man "looks like a farmer." Only recently while listening to a distinguished man who has lived in the city from his youth up, the person sitting nearest me leaned over and whispered 'Doesn't he look like a farmer to you?"

In this phrase "looks like" we have our cue. The alleged difference is entirely external—apparent and not real. Those persons who "can always tell country people" are the same people who can always tell policemen, mail-carriers, conductors, miners and militiamen, provided, these men are dressed in their respective uniform.

Rural people do dress differently from city people, and it is to be expected that they should. Work on the farm calls for clothing unlike that worn by city folk. It would be just as much out of place for a farmer to wear a neatly pressed suit, patent leather shoes, a stiff-bossomed shirt, and a high collar in the harvest field, or in the piggery as for a banker to stand before the receiving window, or a professor before his class, donned in plow shoes, blue-ribboned overalls, and with a bandana handkerchief about his neck. And it would not be a whit more unfair or unreasonable to expect cultivated, well-to-do city women to receive their afternoon callers or go a-walking dressed in a sun-bonnet and a Mother Hubbard than to expect farmers' wives to go about their work having on high-heeled shoes, silk stockings, and an up-to-date hat and dress. Furthermore those who have made unannounced calls in the city know that city people are not always ready for the photographer. They, too, allow their work to determine the manner of their dress, and it is right and proper that they should.

"But," rejoins the urban snob, "when fixed up in their best, our country cousins are out of style." This statement admits of two answers. In the first place, country people do not spend much time watching the kaleidoscope of fashion. Secondly, having occasion to wear their street clothing but once or twice a week, a good suit, dress, or hat, will remain good many times longer in the possession of a country person than in the possession of a city person. This means that country people must either cast aside perfectly good clothing twice a year, or do as their city cousins do, continue to wear it, when needed until it becomes shabby or shiny. They usually do the latter, and it is unkind of anyone to disparage them for so doing.

A second cause for saying country people are different, we are told, is their tendency "to rubber and appear awkward" when in the city. Those who speak of this are most likely to be they who when in the country are curiously looking here and there, and asking questions which seem more than foolish to country people. And, they are probably among those who are afraid cows will bite and fire-flies will burn. I read recently of a city woman who wanted to know why Mr. Burbank does not try his hand at producing ready-made strawberries-and-cream by "grafting a strawberry sprout onto a milkweed."

The facts are, many city people are just as "green" and curious in the country as rural folk are when in the city. Each is eager to "take things in" when in the abode of the other. People who live in Charlestown seldom lift their eyes toward Bunker Hill Monument, while visitors stand before the vast obelisk in awe and wonderment.

Sometimes we hear it said country people are different in that they are more frugal and parsimomious than city people. Doubtless, there is some truth in this observation. But it is primarily due to necessity being laid upon them in this particular. Because a man owns a rich farm, it does not follow that he has money in his pocket at the close of each week or month, as does the average city man. It is very likely that he depends upon the sale of his crops or his live stock to supply him with money, and these are marketed but once a year. And in a majority of cases, there are accumulated bills to consume the full amount of returns. I know a farmer who owned 240 acres of land valued at $200 per acre who had to borrow money to meet his current subscriptions to his church. This man was feeding a large herd of steers which were consuming not only the products of his own field, but also many bushels of grain purchased of neighbors to whom interest bearing notes were given in payment thereof. Numerous agents and solicitors visited this farmer during these lean months, failing to obtain the cash or subscriptions they sought, they went away calling the farmer ugly names and refusing to believe that he did not have stacks of money available. Besides, it is exceedingly tempting to most men to seek promising investments when they are in possession of a few hundred dollars. It is actually true that scores of farmers who are reputed "rich" have less money with which to buy daily and weekly necessities than the average city laborer. And this very fact has caused thousands of young men to leave the farm who ought this day to be numbered among our agriculturists.

Although this could in no wise contribute toward making it possible for an urbanite to identify country people upon sight, it is true that there are certain words and phrases which are peculiar to country people. I shall not say that they misuse is and are; was and were; has and have; can and may; and will and shall, any oftener than the rank and file of city people. Nor shall I charge them with doing more than their share of splitting infinitives and confusing adjectives and adverbs. But there are a goodly number of harsh and erroneous phrases, such as, "I reckon," "right smart," "waiting on" for waiting for; "get shut of" for get rid of; "bad sick," and "them" as an adjective, which seems to belong peculiarly to country people. But these will soon be made a memory by that increasing number of educated young people who are returning to the farm.

In much the same way, it could be argued that country people cause themselves to appear different by acquiring a peculiar perspective or point of view. This characteristic can be illustrated by citing the incident of a farmer who when taken by a city cousin to one of the largest and finest coliseums in America exclaimed "What a great place this would be to stow away hay!" But nothing is more natural, it seems, on the part of people everywehre than to "talk shop." The merchant thinks and talks in terms of business; the lawyer carries his habit of inquiry and "extraction" wherever he goes; and many ministers and teachers reveal their calling in their faces as well as by their speech. It would, therefore, be equally correct to say that the lawyer, the doctor, the merchant, and the minister, each has his peculiar perspective and point of view. Every calling creates its own characteristics, and though country people do exhibit certain superficial traits or earmarks, they are no more different from city people than persons of any calling are different from the persons of all other callings.

"What though on hamely fare we dine,
Wear hoddin gray, an' a' that;
Gie fools their silks, and knaves their wine,
A man's a man for a' that."

O. F. Hall,
Purdue University, Indiana.

CONTROL OF WHITE-GRUB

Wherever the white grub was destructive last year or wherever spring cultivating shows large white grubs in the soil, the farmer should regard these facts as calling (1) for action to protect his 1916 crops from damage, and (2) for continued warfare on the white grub to prevent heavy destruction of crops in 1918.

The white grubs that were so destructive during the summer of 1915 will have wintered in the ground and may be exepected to come nearer the surface as large grubs in April and May. These large grubs will feed to some extent on the roots of plants and may be expected to come nearer damage to this year's crop, but fortunately by the middle of June they will become dormant, change to pupae early in July, and by the first of September become beetles, which remain underground until the spring of 1917.

As the mature white grubs and the pupae are tender and more easily killed by a disturbance of the soil than are the beetles, the entomologists of the department advise the farmer to plow up his land as soon after July 15, 1916, as practicable. The beetles, if allowed to winter in the earth, will emerge as May beetles in May, 1917, lay eggs and thus start another destructive brood of white grubs that if not destroyed may do as much damage in 1918 as grubs did to crops during 1915.

Immediate Measures for 1916

To lessen the damage during 1916 from the brief spring feeding of these large grubs, the following measures are important:

(a) If the ground is to be plowed or cultivated in the spring, delay plowing as late as possible, or until the grubs have returned to near the surface (about the last of April), and have chickens follow the plow to destroy the grubs that are turned up.

(b) Delay planting until the 15th or 20th of May or a little latter if practicable. The object of this is to have the roots of the young plants develop so late that this year's large grubs

YOU CAN'T PLOW WITH AN AUTOMOBILE

Power and weight are necessary factors in heavy traction work like plowing. Many attempts have been made and are being made now to do this class of work with light-weight explosive engines.

They do not and cannot get the same economical results that properly designed and constructed Oil-Gas Tractors can accomplish.

NICHOLS & SHEPARD CO.'S OIL-GAS TRACTOR

Is properly made to do the work that it is expected to do. It is not an experiment, but a tried and tested machine, good enough and reliable enough to be sold under the Red River Special name and guaranty.

It will plow, haul and work at the belt with the steadiness and sureness of steam.

Operating economies are highly developed. It has the power, it has the strength, it has the weight to do the things that you want it to do—and that we guarantee it to do—without stalling or breaking down. That's business.

DON'T TRY TO WORK A PLEASURE MACHINE

There's a lot to this gas engine question. It i well worth careful investigation before you bu any kind of a tractor that makes power wit oil or gasoline. Write us for particulars an consider the facts that we put before you be fore your decision is made. Ask for the Hom Edition of the Red River Special paper and th Big Catalog that tells about our line.

will not have much chance to do damage before they become dormant early in June.

(c) Where possible, on land that is infested avoid planting corn, timothy, strawberries, or early potatoes.

Work to Save 1918 Crops

As has been stated, the large grubs that appear this spring will become the May bettles of the 1917 fight, which lay the eggs for and thus begin the three-year cycle of white grubs that threaten the crops of 1918. Therefore, as soon after July 15, 1916, as is practicable, in all infested regions, farmers should plow up every piece of ground which contained quantities of grubs in 1915 or showed large grubs in any quantity this spring. A plow which will break up the soil as it is overturned should be used, or if this is not possible the ground should be deeply disked after it is plowed, in order to break up the soil and disturb the insects in it. The work done in the fall of 1916 will be a good beginning of preventive measures which must be carried out each year to avert the heavy destruction of crops by this brood in 1918. To carry out the rest of the work it is particularly important to watch the time of occurrence of the beetle and the grub and to note its abundance so as to take adequate protective measures. For example, if there is a heavy flight of May beetles—and this can be expected in April and May, 1917—farmers should use lantern traps at night and spray trees with arsenicals to destroy beetles feeding and breeding on them. Next, in the fall of 1917, grass and small grain should be plowed previous to October 15, 1917, to destroy the young grubs hatched from the eggs of the beetle.

Where the land shows small grubs in the fall of 1917, the owner should plow it thoroughly prior to October 1, and seed it to small grain or clover for the following year. Corn or potatoes should not be planted on such land the following season. Hogs should be pastured on it and chickens allowed the run of the fields when plowed. Finally, if in the spring of 1918 small grubs are abundant, heavy damage may be expected during the coming summer. Seed such land to small grain or clover. Do not plant corn or wide-row crops on such land. Put corn, potatoes, field beans, etc., on ground clean cultivated the preceeding year. Pasture hogs on the infested ground at any time, but more especially between April 15 and October 15, as they do much to root out and destroy the grubs.

Rotations Especially Important

Rotations are especially important in avoiding grub injury. A rotation of oats, clover, and corn has proven very satisfactory in some sections. Ground which is in corn or has a heavy stand of pure clover during the year the beetles are flying, which will be 1917 in the infested area referred to, will ordinarily contain few grubs, since the beetles will not seek such land for laying their eggs. The beetles prefer land in small grains, timothy, or covered with weeds for egg laying. Land which is in oats during the flight of the beetles will contain many grubs, but if clover, which is one of the least susceptible crops, follows, the grubs will scarcely injure that crop. It is asserted that clover winter kills badly in southern Wisconsin, northern Illinois, and similar latitudes, but there is reason to believe that winter killing is due to the fact that the clover is not sufficiently strong to survive severe winters, and the remedy is liming or otherwise treating the land so as to grow a vigorous stand of clover. Aside from this rotation, it is desirable to so arrange the crops that the least amount of land will be in timothy and small grain the year the beetles (1917) are abundant, and the following year (1918) to plant corn on corn ground, and use for small grain and timothy the ground which was in these crops the previous year.

—Weekly News Letter.

A PLEA FOR WILD GAME

To The Missouri Farmer:

The writer, in his official duties as State Highway Commissioner traveling over the state, finds that the large number of roads that are being built in all the counties is going to make it so that automobiles, and other vehicles can easily and quickly go into all parts of all of the counties, and it is only a question of a very short time, until all our wild game will be practically killed off over the entire state, unless some steps are taken to conserve and propagate game.

There are now no wild turkeys north of the Missouri River, except possibly a very few in the southern edge of one or two counties, next to the Missouri River, and the wild turkeys are being rapidly killed off south of the Missouri River.

Deer, which were plentiful only a few years ago over many of the counties in the southern part of the state (and seventy-five years ago even in many of the northern counties) have practically all been killed off, in most of the counties in the state. The few remaining deer in the south and southeastern part of this state will very soon be all killed by hunters if not protected, and propagation farms started.

Our native quail in some counties are now nearly a thing of the past; native pheasants already are practically gone, but possibly enough left to propagate; prairie chickens are only to be found scattered here and there over the State, mostly in the northern counties, where formerly there were large coveys of them, but by reason of being protected under present laws are commencing to migrate into adjoining counties, where farmers generally are killing none themselves, and are watching very carefully to see that none are killed by hunters.

The object of this letter is to call attention to the necessity of there being established in every county in the State of Missouri a game preserve and propagation farm.

In nearly every county, there are large tracts of land held by farmers, by non-residents, or lands held for investment and by people who, if this matter matter was called to their attention would be perfectly willing to do no hunting themselves, and to allow no hunting done on their premises whatever, even by their friends, and probably a place located in said enclosure for propagation, and still not interfere with land being used for agricultural purposes.

Under a properly worded lease and for a sufficient length of time to warrant the outlay, public spirited men in every county can probably be found who will organize a regular legal association to see that some of these tracts of ground are fenced with a game-proof fence, or at least on very large tracts permit no hunting on the premises by anyone, not even by the owner or his friends, because as soon as the game would become plentiful, the owner would soon have more friends than he ever knew existed.

Then at some location in the interior of these large tracts, there should be made absolutely bird and game-proof enclosures of proper size, for the propagation of game and where the small birds could be trapped, and their wings clipped, so that they could not get out of the enclosures, and being fenced the different classes of enemies of the birds, such as fox and other animals which destroy much game, could be killed off.

The hunters of the state, even in sections that heretofore have opposed all kinds of game laws as effecting their rights, are now becoming satisfied that game laws must be strictly enforced and protection given for their benefit, and this plan is for their especial interest as it removes but a small amount of area of hunting territory, and later game so propagated can be turned loose or shipped to counties where game is scarce, and a start made of getting game in that locality.

At the coming session of the Legislature, deer, wild turkeys, prairie chickens, and pheasants should be absolutely protected for at least a period of five years.

Our native quail can be easily propagated, for it has been done successfully by persons with whom the writer is acquainted, who have done so in very small enclosures, and inside the city limits, and hunters should keep wounded birds for that purpose, and nests that are disturbed during harvest seasons, the eggs should be artificially hatched.

The success and practicability of game preserves can be well seen in the one established by the late Hon. Moses Wetmore of St. Louis, and his associates, where in Taney County large numbers of deer, elk, etc., have been raised very successfully, also the hunting preserve of the "Painted Rock Club" in Osage County, of 1600 acres, where within two hours ride from the State Capital, deer, wild turkey and other game are raised, and some escape and migrate into the adjacent territory so that wild turkeys and deer were killed last fall within seventeen miles and less, of Jefferson City.

It is now up to each county, through its hunters and public-spirited citizens to put this plan into immediate effect in their different counties; by farmers as individuals; by associations of men in these counties, who will lease grounds, and make game preserves, and post premises thoroughly and prosecute vigorously any one hunting in said preserves. Soon the extra game that will get out of any of these preserves under the most careful watching, and also can be turned out as it becomes too plentiful, will make good hunting for true sportsmen, for many years to come.

In the New England States there are moose, in New York and Pennsylvania deer, and also deer can be found in a number of other states, where they were wise enough not to wait until too late.

The slaughter of the immense herds of buffalo and the extinction of the same, the complete extinction of the wild pigeon, and to a great extent the elk (which would also have been killed off except for the Government having such game preserves as Yellow Stone Park) should be a lesson not to be soon forgotten.

Frank W. Buffum,
State Highway Commissioner.

Cold, damp storms of early Spring never bother the cozy household warmed by AMERICAN Radiators and IDEAL Boilers, which furnish heat to suit the weather.

Defeat chill days of early Spring

Farm life in the early Spring, when weather is changeable and dangerous, can be made most pleasant and healthful by flooding the entire house with the health and comfort-giving warmth of an IDEAL heating outfit.

AMERICAN RADIATORS & IDEAL BOILERS

If you have managed to get through the entire winter with stoves or other old-fashioned methods of heating, you have suffered more of discomforts and inconveniences during one winter than you will ever again experience if you adopt the IDEAL heating way.

So decide now to find out all about AMERICAN Radiators and IDEAL Boilers. They give you and the family the warm, healthful home to which you are entitled.

IDEAL heating—best for farm house

During chilly days and blizzard days the IDEAL Boiler furnishes just the heat required to keep the house comfortable all over without waste of fuel. Gives any farm house all comforts of a city home. Water mains not necessary. Saves labor and burns smallest amount of fuel. Thousands in use in every State in the Union. Farm houses have use for IDEAL heating at least eight months in the year, and on sudden cool Summer days a little kindling-fire instantly puts genial warmth all through the house.

A No. 020 IDEAL Boiler and 262 ft. of 38-in. AMERICAN Radiators, costing the owner $185, were used to heat this farm house, at which price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions.

Write today for "Ideal Heating"

You will get this valuable book free, by return mail. Get started on your outfit right away. Prices are attractive, so act at once!

IDEAL Boilers have large fuel pots in which air and coal gases thoroughly mix as in a modern gas or oil mantle or burner, and extract every bit of the heat from the fuel. Easier to run than a stove.

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the potoffice at Columbia, Missouri, as second-class mail matter.

THE GOLDEN HOOF

Of all the classes of live stock adapted to Missouri conditions the two which are pre-eminetly fitted for the man of small means or for the man with land poor in fertility have so far had the least attention. We speak of the dairy cow and the sheep. And while we say these two classes of farm animals are so well suited to building up poor lands and for men of small means they are equally well adapted for making rich lands richer and to maintain the prosperity of the well-to-do farmer.

If we could increase the number of dairy cows in Missouri five times, ample feed could be provided for them without sacrificing any of the other stock we now have. Likewise we could find pasturage and winter feed for ten times the number of sheep now in Missouri and miss little save the weeds and briars now infesting our fields and roadsides. The annual returns from the increased number of cows and sheep would amount to somewhere between $100,000,000 and $150,000,000 annually based on a conservative estimate. These figures are based upon the actual results that are annually obtained on many of the farms where dairying and sheep husbandry are followed.

If any of our readers think these statements are an exaggeration we ask them to read the following quotations from a Bates County farmer, Mr. E. E. Laughlin, who, while keeping draft horses, cattle and swine on his farm has for a long time found a place for a flock of sheep: "I have a flock of ewes, some black face, some white, but all very good, and I am counting on $10.50 a head for this spring's proceeds. Sixty days from now I count on $7 a head for the lambs and the fleece at $3.50 in the sack and the ewes young and ready for another coupon next year and when she is done breeding will pay her first cost on the market. I have kept sheep all my life but such prices as we are now offered are unprecendented. Twenty years ago a leg-of-mutton was not thought much of and the average price for a lamb was 50 cents and only $1.50 for ewes. But I think the art of cooking more than anything else is the cause for the present "profitable prices."

Men's likes and dislikes are more or less controlling factors in the kind of farming they follow but in the face of the profits some of our most successful farmers are getting out of both dairying and sheep raising is it not about time men should try to train themselves to suit conditions rather than try to do the impossible of trying to change natural tendencies to suit individual tastes? Our likes and dislikes are largely a matter of training anyway and it should not be a very difficult task for a man to take pride and pleasure in a nice herd of dairy cows or a flock of sheep if by doing it he changes loss into profit, failure into success.

The land that is trod by the golden hoof of the dairy cow or the sheep will be producing big crops generations after the richest soils devoted exclusively to crop growing have been exhausted.

DEBENTURE BONDS

In the discussion of the Missouri Land Bank some of our readers do not understand very clearly the meaning of "debenture bonds." A Vernon County reader writes that he is very much in favor of the features of the Missouri Land Bank so far as he understands them but asks for an explanation of the debenture bonds provided for in the bill.

A debenture bond is one based on a certain specified income or security and in the Missouri Land Bank Act the debentures are secured by the mortgages given by borrowers and also by the capital and net reserve fund of the bank. A trust company organized under the laws of Missouri can loan its funds to farmers and take their notes secured by mortgage. When their available capital is all loaned they may then issue debentures. that is they issue bonds secured by the mortgages they have in their vaults and when these bonds or debentures are sold for cash the company has available money for making more loans and this may be repeated until the company has sold debenture bonds to the amount of ten times the capital stock. The trust company gets for its profit the difference between the rate of interest collected on the farm loans and the rate they pay on their bonds.

The State of Missouri has no money to loan on mortgages but under the provisions of the Missouri Land Bank the Legislature will create a working fund for the bank by making an appropriation out of the general revenue fund of $1,000,000, this appropriation to be repaid out of the profits of the Land Bank. Out of this capital the bank commissioner will make loans to farmers under the restrictions of the law, the loans to draw 4.8 per cent interest and to be secured by first mortgages on farm lands appraised at double the value of the loan.

When $500,000 has been loaned the Land Bank will issue a like amount of bonds (debentures) secured by the mortgages on hand and also by the assets of the bank. This process may be repeated if the bonds can be sold until $40,000,000 has been loaned based on the capital and $30 for every dollar in the net reserve fund. The law provides that the first series of bonds shall be drawn bearing 4.3 per cent and if they can be sold at par the Bank will get one-half of one per cent annually. Suppose the first year the Bank sells $1,000,000 then its profits will be $5,000 a year until the bonds are cancelled. If the Bank can succeed in placing $40,000,000 of loans and selling a like amount of bonds the Bank's income on that basis would be $200,000 a year. Out of this income the Bank must pay the necessary expenses, in time repay the state and pay any losses if by any possibility there are any losses.

These bonds will be more readily negotiable than the mortgages and are better secured because each bond in a series is secured by the whole amount of the mortgages included in that series. It is on account of the better security that the bonds may be sold on a lower interest rate than the individual loans will pay.

MORE ABOUT THE INCOME TAX

A reader from Livingston County writes that after reading our recent editorial advocating the income and inheritance plan of taxation to take the place of all property taxes that he is very favorably impressed with the idea. But he asks, "How will you get at the fellow who buys land and holds it for speculation? How would you collect income from the Irish landlord you mentioned who has made many millions of dollars by buying land in this country and holding it for its increased value? It seems to me that right there is where we ought by all rules of justice try to get a large share of our state, county and municipal revenues—on the unearned increment of land." We are glad our subscriber asked this question because we agree with him that the unearned increment of land ought to be taxed and we will tax it under both the income and the inheritance plan of raising revenue. The increased value of land certainly is in fact income and if it is it only remains to work out a practical method for collecting the income. I see no reason why all income from land whether it should be the rental income or the increase in value could not be charged against the land. This would be about as simple a method as we have now except we would get at the value of land in a more scientific way. The land could be appraised every five years and the rental income as well as the increase in value would be caught in this way. By taxing all incomes from land, whether rental or increased values, we would get the non-resident and resident land owners alike. If this plan had been in operation for the past 20 years during which time there has been a great increase in land prices Missouri should have collected millions of dollars from these non-resident land owners who have been getting rich on the state's growth without rendering any service in return.

The trouble with most of us is that we just jog along in the same old ruts made for us by the pioneers and we do not stop to think if there is not a better way. Missouri made a beginning with the inheritance tax several years ago but it is only a beginning because we tax only collateral inheritances. As it stands now the collateral inheritance tax all goes to the support of the state university and that causes much opposition. What the state ought to do is to pass a law taxing all inheritances, above a reasonable exemption, and let the money go into the general revenue fund.

According to our way of thinking we should tax wealth, not industry. We should let the burden of maintaining the government rest on the shoulders of the people according to their ability to pay and not according to numbers. The poor man may not pay anything to the tax collector but if some one is making a profit out of his labor he is possibly rendering service to his country according to his ability. For this reason we are opposed to levying poll taxes for any purpose whatever.

ENTERTAINMENT IN THE FAR CLUB

We frequently have the leader f farm clubs write us that after an e thusiastic organization of a club a a few live meetings have been he the interest then begins to lag and t attendance to fall off and they are a loss to know how to hold the cl together and maintain the enthusias of the members. In answer to the letters let us say that the success f many clubs have been due very large to the tact and iniative ability of o or two leaders but where such leade are absent there is no reason why club can not be maintained in a school district in the state if the pe ple want it and feel the need of No community is going to support club unless they feel the need of it.

One of the club presidents says th after he had put through several dea that saved the members of his cl quite a number of dollars he fou the interest waning and the attendan at the meetings falling off. In t neighborhood was an old time fiddl and the president arranged with hi to furnish a few pieces of music ar new life and increased attendance wa the result.

There are few people who do n love music and the club leaders wh can secure the help of a violinist, loca orchestra, a quartet or something the kind will find it a great help i keeping things moving.

Another feature club leaders shoul not overlook is that of lectures o special subjects. The State Board c Agriculture has some splendid lectur ers and the College of Agriculture ha a large force of good men and wome in the extension service and the clu that is alive and awake to the interes of the neighborhood should have thre or four of these lectures every yea Then most any club can occassionall have a lecture from some local min ister, teacher, lawyer, doctor or den tist. When some infectious or con tagious disease is in the community why not have some phsyician who i a member of the local board of healt make a talk on the prevention of th spread of such diseases? None o these should take the place of practical farm topics or of the better methods of buying and selling that we have had so much to say about in our columns but an occasional lecture as suggested with some form of music or other light entertainment will insure the clubs future.

SOME TIMELY SUGGESTIONS

While politicians are fighting over the offices and wrangling about who is to blame for the shortage of state finances, farmers can get some relief by looking ahead to see what may be done to help make the old farm pay a little better next year than it has been doing. We do not hesitate to say to the farmer who is trying to get along without growing some legume on his cultivated land, one year in three or four, is making a serious mistake.

There is no one legume best adapted to all conditions but there is not a farm in the state where at least one of the following legumes should not be grown, namely, red clover, alsike colver, alfalfa, sweet clover, cowpeas or soy beans.

Now is a good time to begin the preparation of a piece of ground for alfalfa and we know of no better way to begin than by sowing cowpeas or soy beans in May. The working of the land for these crops is just what is needed to put it in condition for seed-

ing alfalfa and these crops through their power to take nitrogen from the air and store it in the soil will leave some material to start the young alfalfa in good shape.

Another suggestion every farmer who keeps 10 head of cattle should be thinking about is that he should have a silo. A fifty bushel crop of corn will make about ten tons of silage and four acres of such corn put into the silo supplemented with a little alfalfa, clover or cowpea hay will take 10 head of cows through the winter in good shape. The silage is equally valuable for any other cattle and is successfully fed to sheep, mules, and horses but we mention the cows to show what it is really worth when compared to the old and generally practiced method of feeding the corn crop.

Look about you and see if it is not the farmer with a silo and with a few stacks of good legume hay for winter who is maping the most headway towards paying for the farm.

BARNYARD GOSSIP

A few days ago there was quite a destructive storm which swept through Western and Central Missouri and a great many houses, barns and silos were blown down, some buildings were consumed by fire caused by lightning, some live stock were killed or injured. In reading reports of these losses in local papers we get the impression that a large majority of the losses are not covered by any insurance and therefore fall heavily upon the injured owners.

A man may reason that as his home has stood for forty years unscathed by the wind and unharmed by fire that he can better afford to carry the risk than to pay a premium every year that will insure him against loss, but if loss does chance to come it soon changes his process of reasoning. The real gainer in the insurance business is the man who escapes loss. I know there are sometimes just cause of complaint against exorbitant rates of insurance companies, or against the practices of unscrupulous agents but the remedy against these is to hunt out the honest agents who represent conservative, and reliable companies or else organize mutual cooperative insurance societies.

I know millions of dollars have been filched from the pockets of farmers and others to pay big salaries and swell the reserve account of the big companies but this is a poor excuse to offer for neglecting to take out a policy that will insure a man and his family in time of loss and distress. The remedy against too high premiums is mutual insurance. Thousands of farmers can testify to the reasonableness and reliability of farm mutual companies as a protection against loss from fire or lightning but every farmer who owns a home of any kind should feel it his moral duty to unite with one of these mutual companies. If he never has a loss he can comfort himself with the thought that he has been living the golden rule and that his yearly premium has gone to make good the loss of some unfortunate brother. We think cooperative insurance, either life or property is the finest institution ever organized by men.

There are other kinds of insurance worthy our consideration and one of them is deversification of crops. Watch the man who sticks to a one crop system of farming and see if he does not fail in about nine cases out of ten, possibly ninety-nine out of a hundred. All over the south thousands of farmers are in bondage to debt because of the one crop system. Throughout the west there are hundreds of farmers who have failed because they have stuck to the one-crop system of all wheat or all corn. When the land was low in price and high in fertility there may have been some excuse for bending every effort to growing great areas of wheat or corn year after year but now when the land is high in price and low in fertility the man who sticks to the one crop system is pretty sure to fail.

The greatest security against loss in farming is a rich soil and we all know that it is a very difficult and expensive proposition to try to maintain a high state of fertility under the continuous cultivation of any one crop no matter what that may be.

We sometimes wonder why we should be inflicted with crop-pests like the chinch bug but possibly this little bug may have been a blessing in disguise. Any way we know that thousands of farmers have learned the value of cowpeas, soy beans, alfalfa, clover and other legumes because they were driven to find some crop the chinch bug would not destroy. There is not a crop adapted to our climate that has not some good reason for growing it but on the other hand every crop has its enemies and when our system of farming gets out of balance Nature steps in with some disaster to put us right.

A New Kind of Monopoly

The sisal inquiry by the Senate committee on agriculture has revealed an astonishing state of affairs in which the American farmer is the victim of an international monopoly and First Chief Carranza one of the beneficiaries.

Yucatan produces nine-tenths of the world's sisal crop, and this sisal composes nine-tenths of the binder twine used by American farmers in harvesting their grain crops. The testimony brought out by the Senate committee shows that American financiers combined with an organization of Yucatan planters to monopolize the sisal crop under the sanction of military force exercised by Carranza, who receives a share of the profits. The sisal monopoly, it appears, furnishes a large proportion of the revenue of the de facto government of Mexico.

After having perfected the monopoly the combination began to raise prices, and it has been shown that American farmers will be compelled to pay $5,000,000 more than last year for twine. The trend is still upward. It was for the purpose of ascertaining why binder twine was increasing in price that the inquiry was started. It was at first thought that the International Harvester Company controlled the twine market, but the evidence shows that the Harvester company is merely a buyer of sisal from the monopoly, and is not interested in growing or marketing sisal. The financial interests backing the monopoly have skillfully sought to place the blame upon the Harvester company, but the committee has finally got at the truth.

The question now is, can the monopoly be prosecuted under the anti-trust laws? It was conceived in the United States and its profits are derived from American farmers, but it is organized in Mexico and its materials originate there. The courts have held in some instances that the anti-trust acts do not apply to monopolies in foreign countries, even if Americans are the organizers and beneficiaries.

As a temporary expedient the Federal Trade Commission has been asked to supervise the marketing of the present sisal crop in order that manufacturers buying this raw material shall have equitable treatment. This arrangement does not get at the root of the evil, however, and it is evident that the law must be amended so that monopolies may not be engineered by Americans in foreign countries, thus circumventing the antitrust laws, although deriving their profits from victims within the United States.—The Washington Post.

Barnyard manure applied to clover sod to be turned under later in the spring has yielded an average return of $4.69 a ton in experiments at the Iowa experiment station. Applications on clover-mixed meadows left for hay have produced an annual return of $3.75 a ton at the Iowa station.

Why Take A Chance?

WHEN you buy your grain binder this spring, do not make the mistake of experimenting with an untried or cheap machine. You cannot make money that way. A binder is useful for one purpose only—to get all the grain cut and bound in the short time allowed for the harvest. That is no time to risk experiments, especially when you do not have to. Choose your binder from one of the old reliable, yet up-to-date in every way, **International Harvester** binders sold under the trade names—

Champion Deering McCormick
Milwaukee Osborne Plano

You will find practical farmers, who know what particular harvesting difficulties they must overcome each year, urging the use of some binder with an **IHC** name. Years of building and betterment have resulted in these machines that insure as complete a harvest as it is possible ever to get, even under worst field and grain conditions.

Look for the same high-grade workmanship, the same famous **IHC** quality in **IHC** twine. Make the most of your crops. Your local dealer can furnish you with **IHC** binder repairs and twine. See him or write to us for information.

International Harvester Company of America

New Perfection Oil Cook Stoves

No Odor No Smoke No Ashes

Truly that is the housewife's idea of paradise. And those features are only a few of the many advantages of cooking with *New Perfection Oil Cook Stoves.*

No longer is it necessary for you to suffer from the intense heat of the wood or coal burning range long before you are ready to begin operations.

Just touch a match to the wick and your fire is ready when you want it.

You can have a slow fire or an exceedingly hot one; just as you wish.

You don't have to watch it either. The flame will not creep up or diminish.

The Long Blue Chimney

is the key to the efficiency of the New Perfection Oil Cook Stoves.

The flame never touches the bottom of the utensils. Every atom of oil is burned and converted into usable heat in the long blue chimney. No waste—no dirt—no odor. It makes your summer cooking easy.

Write for booklet giving full description and prices of the various types.

David Dunne

A Romance of the Middle West

By BELLE KANARIS MANIATES

CHAPTER IV

Outside of the time allotted for the performance of wholesome amount of farm work and the preparation of his daily lessons, David was free for diversions which had hitherto entered sparingly into his life. After school hours and on Saturdays the Barnabas farm was the general rendezvous for all the children within a three-mile radius. The old woods by the river rang with the gay treble of childish laughter and the ecstatic barking of dogs dashing in frantic pursuit. There was always an open sesame to the cookie jar and the apple barrel.

David suffered the common fate of all in having a dark cloud. Jud was the dark cloud, and his silver lining had not yet materialized.

In height and physical strength Jud was the superior, so he delighted in taunting and goading the younger boy. There finally came a day when instinctive self-respect upheld David in no longer resisting the call to arms. Knowing Barnabas' disapproval of fighting, and his mother's parting admonition pricking his conscience, he went into the battle reluctantly and half-heartedly, so the fight was not prolonged, and Jud's victory came easily. Barnabas, hurrying to the scene of action, called Jud off and reprimanded him for fighting a smaller boy, which hurt David far more than did the pummeling he had received.

"What wuz you fighting fer, anyway?" he demanded of David.

"Nothing," replied David laconically, "just fighting."

"Jud picks on Daviey all the time," was the information furnished by the indignant Janey, who had followed her father.

"Well, I forbid either one of you to fight again. Now, Jud, see that you leave Dave alone after this."

Emboldened by his easily won conquest and David's apparent lack of prowess, Jud continued his jeering and nagging, but David set his lips in a tight line of finality and endured in silence until there came the taunt superlative.

"Your mother was a washerwoman, and your father a convict."

There surged through David a fierce animal hate. With a tight closing of his hardy young fist, he rushed to the onslaught so swiftly and so impetuously that Jud recoiled in fear and surprise. With his first tiger-like leap David had the older boy by the throat and bore him to the ground, maintaining and tightening his grip as they went down.

"I'll kill you!"

David's voice was steady and calm, but the boy on the ground underneath felt the very hairs of his head rising at the look in the dark eyes above his own.

Fortunately for both of them Barnabas was again at hand.

He jerked David to his feet.

"Fightin' again, are you, after I told you not to!"

"It was him, David, that began it. I never struck him," whimpered Jud, edging away behind his father.

"Did you, David?" asked Barnabas bluntly, still keeping his hold on the boy, who was quivering with passion.

"Yes."

His voice sounded odd and tired, and there was an ache of bafflement in his young eyes.

"What fer? What did he do to make you so mad?"

"He said my mother was a washerwoman and my father a convict! Let me go! I'll kill him!"

With a returning rush of his passion, David struggled in the man's grasp.

"Wait, Dave, I'll tend to him. Go to the barn, Jud!" he commanded his son.

Jud quailed before this new, strange note in his father's voice.

"David was fighting. You said neither of us was to fight. 'T ain't fair to take it out on me."

Fairness was one of Barnabas' fixed and prominent qualities, but Jud was not to gain favor by it this time.

"Well, you don't suppose I'm a-goin' to lick Dave fer defendin' his parents, do you? Besides, I'm not a-goin' to lick you fer fightin', but fer sayin' what you did. I guess you'd hev found out that Dave could wallop you ef he is smaller and younger."

"He can't!" snarled Jud. "I didn't have no show. He came at me by surprise."

Barnabas reflected a moment. Then he said gravely:

"When it's in the blood of two fellers to fight, why thar's got to be a fight, that's all. Thar won't never be no peace until this ere question 's settled. Dave, do you still want to fight him?"

A fierce aftermath of passion gleamed in David's eyes.

"Yes!" he cried, his nostrils quivering.

"And you'll fight fair? Jest to punish—with no thought of killin'?"

"I'll fight fair," agreed the boy.

"I'll see that you do. Come here, Jud."

"I don't want to fight," protested Jud sullenly.

"He's afraid," said David gleefully, every muscle quivering and straining.

"I ain't!" yelled Jud.

"Come on, then," challenged David, a fierce joy tugging at his heart.

Jud came with deliberate precision and a swing of his left. He was heavier and harder, but David was more agile, and his whole heart was in the fight this time. They clutched and grappled and parried, and finally went down; first one was on top, then the other. It was the wage of brute force against elasticity; bluster against valor. At last David bore his oppressor backward and downward. Jud, exhausted, ceased to struggle.

"Thar!" exclaimed Barnabas, drawing a relieved breath. "I guess you know how you stand now, and we'll all feel better. You've got all that's comin' to you, Jud, without no more from me. You can both go to the house and wash up."

Uncle Larimy had arrived at the finish of the fight.

"What's the trouble, Barnabas?" he asked interestedly, as the boys walked away.

The explanation was given, but they spoke in tones so low that David could not overhear any part of the conversation from the men following him until, as they neared the house, Uncle Larimy said: "I was afreed Dave hed his pa's temper snoozin' inside him. Mebby he'd orter be told fer a warnin'."

"I don't want to say nuthin' about it less I hev to. I'll wait till the next time he loses his temper."

David ducked his head in the wash basin on the bench outside the door. After supper, when Barnabas came out on the back porch for his hour of pipe, he called his young charge to him. Since the fight, David's face had worn a subdued but contented expression.

"Looks," thought Barnabas, "kinder eased off, like a dog when he licks his chops arter the taste of blood has been drawed."

"Set down, Dave. I want to talk to you. You done right to fight fer yer folks, and you're a good fighter, which every boy orter be, but when I come up to you and Jud I see that in yer face that I didn't know was in you. You've got an orful temper, Dave. It's a good thing to hev—a mighty good thing, if you kin take keer of it, but if you let it go it's what leads to murder. Your pa hed the same kind of let-loose temper that got him into heaps of trouble."

"What did my father do?" he asked abruptly.

Instinctively he had shrunk from asking his mother this question, and pride had forbidden his seeking the knowledge elsewhere.

"Some day, when you are older, you will know all about it. But remember, when any one says anything like what Jud did, that yer ma wouldn't want fer you to hev thoughts of killin'. You see, you fought jest as well—probably better—when you hed cooled off a mite and hed promised to fight fair. And ef you can't wrastle your temper and down it as you did Jud, you're not a fust-class fighter."

"I'll try," said David slowly, unable, however, to feel much remorse for his outbreak.

"Jud 'll let you alone arter this. You'd better go to bed now. You need a little extry sleep."

M'ri came into his room when he was trying to mend a long rent in his shirt. He flushed uncomfortably when her eye fell on the garment. She took it from him.

"I'll mend it, David. I don't wonder that your patience slipped its leash, but—never fight when you have murder in your heart."

When she had left the room, Janey's face, pink and fair as a baby rose, looked in at the door.

"It's very wicked to fight and get so mad, Davey."

"I know it," he acknowledged readily. It was useless trying to make a girl understand.

There was a silence. Janey still lingered.

"Davey," she asked in an awed whisper, "does it feel nice to be wicked?"

David shook his head non-committally.

CHAPTER V

The rather strained relations between Jud and David were eased the next day by the excitement attending the big package Barnabas brought from town. It was addressed to David, but the removal of the outer wrapping disclosed a number of parcels neatly labeled, also a note from Joe, asking him to distribute the presents.

David first selected the parcel marked "Janey" and handed it to her.

"Blue beads!" she cried ecstatically.

"Let me see, Janey," said M'ri. "Why, they're real turquoises and with a gold clasp! I'll get you a string of blue beads for now, and you can put these away till you're grown up."

"I didn't tell Joe what to get for you, Aunt M'ri; honest, I didn't," exclaimed David, with a laugh, as he handed the freezer to her.

"We'll initiate it this very day, David."

David handed Barnabas his pipe and gave Jud a letter which he opened wonderingly, uttering a cry of pleasure when he realized the contents.

"It's an order on Harkness to let me pick out any rifle in his store. How did he know? Did you tell him, Dave?"

"Yes," was the quiet reply.

"Thank you, Dave. I'll ride right down and get it, and we'll go to the woods this afternoon and shoot at a mark."

"All right," agreed David heartily.

The atmosphere was now quite cleared by the proposed expenditure of ammunition, and M'ri experienced the sensation as of one beholding a rainbow.

David then turned his undivded attention to his own big package, which contained twelve books, his name on the fly-leaf of each. Robinson Crusoe, Swiss Family Robinson, Andersen's Fairy Tales, Arabian Nights, Life of Lincoln, Black Beauty, Oliver Twist, A Thousand Leagues Under the Sea, The Pathfinder, Gulliver's Travels, Uncle Tom's Cabin, and Young Ranchers comprised the selection. His eyes gleamed over the enticing titles.

"You shall have some book shelves for your room, David," promised M'ri, "and you can start your library. Joe has made a good foundation for one."

His eyes longed to read at once, but there were still the two packages, marked "Uncle Larimy" and "Miss Rhody," to deliver.

"I can see that Uncle Larimy has a fishing rod, but what do you suppose he has sent Rhody?" wondered M'ri.

"A black silk dress. I told him she wanted one."

"Take it right over there, David. She has waited almost a lifetime for it."

"Let me take Uncle Larimy's present," suggested Jud, " and then I'll ask him to go shooting with us this afternoon."

David amicably agreed, and went across fields to Miss Rhody's.

"Land sakes!" she exclaimed, looking at the parcel. "M'ri ain't a-goin' to hev another dress so soon, is she?"

"No, Miss Rhody. Some one else is, though."

"Who is it, David?" she asked curiously.

"You see Joe Forbes sent some presents from Chicago, and this is what he sent you."

"A calico," was her divination, as she opened the package.

"David Dunne!" she cried in shrill, piping tones, a spot of red on each cheek. "Just look here!" and she stroked lovingly the lustrous fold of shining silk.

"And if here ain't linings, and thread, and sewing silk, and hooks and eyes! Why, David Dunne, it can't be true! How did he know—David, you blessed boy, you must have told him!"

Impulsively she threw her arms about him and hugged him until he ruefully admitted to himself that she had Jud "beat on the clutch."

"And say, David, I'm a-goin' to wear this dress. I know folks as lets their silks wear out a-hangin' up in closets. Don't get half as many cracks when it hangs on yourself. I b'lieve as them Episcopals do in lettin' yer light shine, and I never wuz one of them as b'lieved in savin' yer best to be laid out in. Oh, Lord, David, I kin jest hear myself a-rustlin' round in it!"

"Maybe you'll get a husband now," suggested David gravely.

"Mebby. I'd orter ketch somethin' with this. I never see sech silk. It's much handsomer than the one Homer Bisbee's bride hed when she come here from the city. It's orful the way she wastes. Would you b'lieve it, David, the fust batch of pies she made, she never pricked, and they all puffed up and bust. David, look here! What's in this envylope? Forever and way back, ef it hain't a five-doller bill and a letter. I hain't got my glasses handy. Read it."

"Dear Miss Rhody," read the boy in his musical voice, "silk is none too good for you, and I want you to wear this and wear it out. If you don't, I'll never send you another. I thought you might want some more trimmings, so I send you a five for same. Sincerely yours, Joe."

"I don't need no trimmin's, excep' fifty cents for roochin's."

"I'll tell you what to do, Miss Rhody. When you get your dress made we'll go into town and you can get your picture taken in the dress and give it to Joe when he comes back."

"That's jest what I'll do. I never hed my likeness took. David, you've got an orful quick mind. Is Joe coming home? I thought he callated to go West."

"Not until fall. He's going to spend the summer in his shanty boat on the river."

"I'll hurry up and get it made up afore he comes. Tell me what he sent all your folks."

"Joe's a generous boy, like his ma's folks," she continued, when he had enumerated their gifts. "I am glad fer him that his pa and his stepmother was so scrimpin'. David, would you be'lieve it, in that great big house of the Forbeses thar wa'n't never a tidy on a chair, and not a picter on the wall! It was mighty lucky for Joe that his stepmother died fust, so he got all the money."

David hastened home and sought his retreat in the orchard with one of his books. M'ri, curious to know what his selection had been, scanned the titles of the remaining elven volumes.

"Well, who would have thought of a boy's preferring fairy tales!"

David read until dinner time, but spent the afternoon with Uncle Larimy and Jud in the woods, where they received good instruction in rifle practice. After supper he settled comfortably down with a book, from which he was recalled by a plaintive little wail.

"I haven't had a bit of fun to-day, Davey, and it's Saturday, and you haven't played with me at all!"

The book closed instantly.

"Come on out doors, Janey," he invited.

The sound of childish laughter fell pleasantly on M'ri's ears. She recalled what Joe Forbes had said about her own children, and an unbidden tear lingered on her lashes. This little space between twilight and lamplight was M'ri's favorite hour. In every season but winter it was spent on the west porch, where she could watch

the moon and the stars come out. Maybe, too, it was because from here she had been wont to sit in days gone by and watch for Martin's coming. The time and place were conducive to backward flights of memory, and M'ri's pictures of the past were most beguiling, except that last one when Martin Thorne, stern-faced, unrelenting, and vowing that he would never see her again, had left her alone—to do her duty.

When the children came in she joined them. Janey, flushed and breathless from play, was curled up on the couch beside David. He put his arm caressingly about her and began to relate one of Andersen's fairy tales. M'ri gazed at them tenderly, and was weaving a future little romance for her two young charges when Janey said petulantly: "I don't like fairy stories, Davey. Tell a real one."

M'ri noted the disappointment in the boy's eyes as he began the narrating of a more realistic story.

"David, where did you read that story?" she asked when he had finished.

"I made it up," he confessed.

"Why, David, I didn't know you had such a talent. You must be an author when you are a man."

Late that night she saw a light shining from beneath the young narrator's door.

"I ought to send him to bed," she meditated, "but, poor lad, he has had so few pleasures and, after all, childhood is the only time for thorough enjoyment, so why should I put a feather in its path?"

David read until after midnight, and went to bed with a book under his pillow that he might begin his pastime again at dawn.

After breakfast the next morning M'ri commanded the whole family to sit down and write their thanks to Joe. David's willing pen flew in space with his thoughts as he told of Miss Rhody's delight and his own revel in book land. Janey made most wretched work of her composition. She sighed and struggled with thoughts and pencil, which she gnawed at both ends. Finally she confessed that she couldn't think of anything more to say. M'ri came to inspect her literary effort, which was written in huge characters.

"Dear Joe—"

"Oh," commented M'ri doubtfully, "I don't know as you should address him so familiarly."

"I called him 'Joe' when we rode to school. He told me to," defended Janey.

"He's just like a boy," suggested David.

So M'ri, silenced, read on: "I thank you for your beyewtifull present which I cannot have."

"Oh, Janey," expostulated M'ri, laughing; "that doesn't sound very gracious."

"Well, you said I couldn't have them till I was grown up."

"I was wrong," admitted M'ri. "I didn't realize it then. We have to see a thing written sometimes to know how it sounds."

"May I wear them?" asked Janey exultingly. "May I put them on now?"

"Yes," consented M'ri.

Janey flew upstairs and came back wearing the adored turquoises, which made her eyes most beautifully blue.

"Now I can write," she affirmed, taking up her pencil with the impetus of an incentive. Under the inspiration of the beads around her neck, she wrote: "Dear Joe:

"I am wearing the beyewtifull beeds you sent me around my neck. Aunt MerI says they are terkwoyses. I never had such nice beeds and I thank you. I wish I cood ride with you agen. Good bye. From your frend,

"Janey."

CHAPTER VI

The next day being town day, David "hooked up" Old Hundred and drove to the house. After the butter crock, egg pails, and kerosene and gasoline cans had been piled in, Barnabas squeezed into the space beside David. M'ri came out with a memorandum of supplies for them to get in town. To David she handed a big bunch of spicy, pink June roses.

"What shall I do with them?" he asked wonderingly.

"Give them to some one who looks as if he needed flowers," she replied.

"I will," declared the boy interestedly. "I will watch them all and see how they look at the roses."

At last M'ri had a kindred spirit in her household. Jud would have sneered, and Janey would not have understood. To Barnabas all flowers looked alike.

It had become to be a custom for Barnabas to take David to town with him at least once a week. The trip was necessarily a slow one, for from almost every farmhouse he received a petition to "do a little errand in town." As the good nature and accommodating tendency of Barnabas were well known, they were accordingly imposed upon. He received commissions of every character, from the purchase of a corn sheller to the matching of a blue ribbon. He also stopped to pick up a child or two en route to school or to give a lift to a weary pedestrian whom he overtook.

While Barnabas made his usual rounds of the groceries, meatmarket, drug store, mill, feed store, general store, and a hotel where he was well known, David was free to go where he liked. Usually he accompanied Barnabas, but to-day, he walked slowly up the principal business street, watching for "one who needed flowers." Many glances were bestowed upon the roses, some admiring, some careless, and then—his heart almost stopped beating at the significance—Judge Thorne came by. He, too, glanced at the roses. His gaze lingered, and a look came into his eyes that stimulated David's passion for romance.

"He's remembering," he thought joyfully.

He didn't hesitate even an instant. He stopped in front of the Judge and extended the flowers.

"Would you like these roses, Judge Thorne?" he asked courteously.

Then for the first time the Judge's attention was diverted from the flowers.

"Your face is familiar, my lad, but—"

"My name is David Dunne."

"Yes, to be sure, but it must be four years or more since I last saw you. How's your mother getting along?"

The boy's face paled.

"She died three weeks ago," he answered.

"Oh, my lad," he exclaimed in shocked tones, "I didn't know! I only returned last night from a long journey. But with whom are you living?"

"With Aunt M'ri and Uncle Barnabas."

"Oh!"

The impressive silence following this exclamation was broken by the Judge.

"Why do you offer me these flowers, David?"

"Aunt M'ri picked them and told me to give them to some one who looked as if they needed flowers."

The Judge eyed him with the keen scrutiny of the trained lawyer, but the boy's face was non-committal.

"Come up into my office with me, David," commanded the Judge, turning quickly into a near-by stairway. David followed up the stairs and into a suite of well-appointed offices.

A clerk looked up in surprise at the sight of the dignified judge carrying a bouquet of old-fashioned roses and accompanied by a country lad.

"Good morning, Mathews. I am engaged, if any one comes."

He preceded David into a room on whose outer door was the deterred word, "Private."

While the Judge got a pitcher of water to hold the flowers David crossed the room. On a table near the window was a rack of books which he eagerly inspected. To his delight he saw a volume of Andersen's Fairy Tales. Instantly the book was opened, and he was devouring a story.

"David," spoke the Judge from the other end of the room, "didn't these roses grow on a bush by the west porch?"

There was no answer.

The Judge, remarking the boy's absorption, came to see what he was reading.

"Andersen's Fairy Tales! My favorite book. I didn't know that boys liked fairy stories."

David looked up quickly.

"I didn't know that lawyers did, either."

"Well, I do, David. They are my most delightful diversion."

"Girls don't like fairy stories," mused David. "Anyway, Janey does n't. I have to tell true stories to please her."

"Oh, you are a yarner, are you?"

"Yes," admitted David modestly. "Aunt M'ri thinks I will be a writer when I grow up, but I think I should like to be a lawyer."

"David," asked the Judge abruptly, "did Miss Brumble tell you to give me those roses?"

With a wild flashing of eyes the Dunne temper awoke, and the boy's under jaw shot forward.

"No!" he answered fiercely. "She didn't know that I know—"

He paused in mid-channel of such deep waters.

"That you know what?" demanded the Judge in his cross-examining tone.

David was doubtful of the consequences of his temerity, but he stood his ground.

"I can't tell you what, because I promised not to. Some one was just thinking out loud, and I overheard."

There was silence for a moment.

"David, I remember your father telling me, years ago, that he had a little son with a big imagination which his mother fed by telling stories every night at bedtime."

"Will you tell me," asked David earnestly, "about my father? What was it he did? Uncle Barnabas told me something about his trouble last Saturday."

"How did he come to mention your father to you?"

David reddened.

"Jud twitted me about my mother taking in washing and about my father being a convict, and I knocked him down. I told him I would kill him. Uncle Barnabas pulled me off."

"And then?"

"Then he let us fight it out."

"And you licked?"

"Yes, sir" replied the boy, with proud modesty.

"You naturally would, with that under jaw, but it's the animal in us that makes us want to kill, and the man in us should rise above the animal. I think I am the person to tell you about your father. He had every reason to make good, but he was unfortunate in his choice of associates and he acquired some of their habits. He had a violent temper, and one night when he was—"

"Drunk," supplied David gravely.

"He became angry with one of his friends and tried to kill him. Your father was given a comparatively short sentence, which he had almost served when he died. You must guard against your temper and cultivate patience and endurance—qualities your mother possessed."

It suddenly and overwhelmingly flashed across David what need his mother must have had for such traits, and he turned away to force back his tears. The Judge saw the heaving of the slender, square, young shoulders, and the gray eyes that were wont to look so coldly upon the world and its people grew soft and surprisingly moist.

"It's past now, David, and can't be helped, but you are going to aim to be the kind of man your mother would want you to be. You must learn to put up with Jud's tyranny because his father and his aunt are your benefactors. I have been away the greater part of the time since your father's death, or I should have kept track of you and your mother. Every time you come to town I want you to come up here and report to me. Will you?"

Thank you, sir. And I will bring you some more flowers."

(To be continued.)

What do our boy readers think of our serial story, David Dunne? We would like to have you write us a letter and tell us what you think of the story and which of the characters interest you most. We will be glad to print your letters in The Missouri Farmer.

What Would We Do Without Sugar?

GATHERING SUGAR CANE

HOW SUGAR CANE GROWS

We are so used to sugar that we are likely to forget to give it its properly important place. Right now if somebody asked you what sugar was good for you'd probably say—"Oh! to put in coffee and tea and for making candies and desserts." That's it—we all think of sugar as a sweetener and overlook its value as a food.

The chemists classify sugar as a hydrocarbon—that name may or may not be interesting to us, but what is interesting is their statement that it has, as a hydrocarbon, equal food value with the starchy foods and by digestion largely adds to the fatty tissues of the body.

Why do we eat sugar anyway? Your first answer might be: "Because it is sweet and tastes good." Of itself the answer would be correct, but the more important fact is that the body craves sugar because it needs it. And when the body craves something it gives us an appetite for it. So primarily that's why we like sugar and things made with sugar and not just because they are sweet.

In view of the fact that sugar has gone up so tremendously of late these facts are interesting because we find that instead of the luxury sugar having gone up it is the FOOD sugar that has raised its price. Yet—even though the price is up we have to have our sweet food just the same.

Certainly the makers of that delicious beverage Coca-Cola must have discovered that sugar is up, because one of the principal ingredients in making Coca-Cola syrup is fine cane sugar. Think of it!—they use an average of 80 tons of sugar a day—about 4 carloads. But unlike many manufacturers that company has itself borne the raise and so you and I pay just the same today for our bottle or glass of Coca-Cola that we've always paid. Incidentally, this phase of the situation is a good reminder of the benefits one gets from drinking a beverage as pure and good as Coca-Cola. Not only do we please our palates and derive wholesome refreshment from the drink but we also give our systems that bit of sugar sweetness that they crave and which is necessary to health and tissues. Is it any wonder then that Coca-Cola is so popular and so universally drunk that it has been called "the drink the nation drinks"?

BUCKSHOT BY THE PROFESSOR

Some mighty queer things are going on in the world these days. Everybody seems to be fighting everybody else and those who are not mixed up yet seem to be carrying a chip on their shoulders watching for a chance. The other night I saw more stars falling than I ever witnessed in six months before. Maybe old St. Peter is getting ready to blow the trumpet.

Don't you let anybody put the notion into your head that the Land Bank Bill is "a step toward the Single Tax." Somebody is trying to throw sand in the farmers eyes. This is a campaign year you know and we've got to look out for campaign lies.

If the average mule was permitted to express his real opinion of the fellow who owns and drives him he would doubtless kick him over into the next field.

Maybe the railroads deserve to be kicked around every day in the year because I guess there are some crooks mixed up with the railroad business as well as with other things. But when a Congressman or Senator does it, it would sit better on my stomach if he first refused to collect 10c per mile from the government for every mile he travels on a railroad—pay the railroad two or three cents per mile and then put the balance in his pocket. There is an old saying that he who would invoke equity must do so with clean hands.

There are a pile of fellows trying to figure out whether the Germans will ever be able to take Verdun or not who ought to be running a manure spreader.

I smoked a campaign sigar a couple of weeks ago and wasn't able to write my stuff for the paper. As was to be expected however, that Jim Riley person was on hand. You couldn't keep him out with a club.

Nine times out of ten when you run across an old whiskered codger who swells up and tells you that nobody can tell him anything about farming, its one of those fellows who bought his land for ten dollars per acre years ago—or else inherited it.

Some fellow has said that a widow is a woman who has quit finding tault with her husband. To my way of thinking however it all depends on whether he is dead or not. People should be more careful about what they say.

I see nearly every candidate for governor is assuring his audiences that he doesn't know how to dance. But the real milk in the coconut is, do they know how to do anything else?

After this I am going to build nothing but barb wire fences so candidates for office can't perch up on them and wait for me to plow the round. Actually they're so thick in my county that there's no place for the crows to sit.

A lot of the Farm Clubs which were organized through the great fight made by this paper last winter have saved a lot of money in buying such things as bran, ship stuff and other similar commodities. A lot of them are saving between 3 to 5c per lb. on binder twine too. Better write the Publisher and ask him how they do it.

If vou will send in a dollar and renew your subscription for three years to this paper they will send you enough Sudan grass and Feterita to sow a big patch next year. They also throw in a package of beautiful flower seeds. Better send in your dollar today and get your seeds right away.

By Old Jim Riley

Talkin' about th' way a little old Ford gits over th' ground, did you notice how little old Henry ran fer President in th' primaries up in Nebrasky th' other day? Henry explained it by sayin' that it was th' "latest Ford joke"—but some of these fellers that are hoopin' it up fer war are laffin' on th' other side of their whiskers. Anyhow, a jack rabbit ain't got nuthin' on Henry when it comes to runnin'. Didn't see anything of that Professor feller in the last issue. Guess he must have the mumps.

POSSUM HOLLER DOINS

The rain caused the Possum Holler gang to round up at "Hez" Brown's store Saturday afternoon and many important matters were brought up and disposed of to the satisfaction of all concerned except "Chouce" Baker. "Jep" Thompson says that "Chouce" has such an ingrown grouch that the angel Gabriel couldn't please him. "Chouce" started things off by saying that the World has more "ignerance" in it today than ever before and offered to prove it by the way the farmers up in Nebraska voted for Henry Ford for President a few days ago. "What's grindin you republicans" said "Jep" "is that this little Tin Lizard manufacturer from Detroit is provin' that the people ain't in for whoopin up this war stuff. Little old Henry is soapin the track for you and of course some of the Big Chiefs of your party don't like it—and so they git their papers to hammer Ford so's that fellows like you will commence to yelp at the cross roads." "Well I guess some of the soap is splashin' over in your direction too" countered "Chouce." "Seems to me that Woodrow would pick a fuss with a bunch of spring lambs if he had half a chance these days. Fer instance take that last note that he wrote to—" But at this stage of the game the "Judge" dropped in with a basketful of fresh eggs which he exchanged for some coffee and a quarters worth of "smokin" and somebody asked him what he thought about it and this is what he said: "Well now so far as this little feller Ford is concerned, I think he's kind of harmless like but just the same he ain't as much of a joke as some of us may think. Of course he ain't serious about runnin' for President and I guess the people who have been votin' for him know this perfectly well—but they are usin' Henry to register a protest against this attempt to get the Country crazy for war and unless I am mightily mistaken its goin' to make a lot of the big fellers in both parties sit up and take notice. So far as a powerful Navy and a real army are concerned, of course all of us should be for these things within' the bounds of reason. The whole World is on fire and one way to prevent war is to be prepared for it. But on the other hand, we shouldn't go crazy over it. There wouldn't be nearly as many people killed if men would pit packin' pistols and so its mighty easy to get into war when you've got a big army standin' around doin' nuthin. Before long like as not, we'll strike a happy medium which will solve the thing. If we can give the young men of the Country a trainin' which will make them better physically and at the same time teach them how to be good soldiers when the necessity arises, this is the kind of plan I'd be in favor of. What I don't like is the idea of a big standin' army which hasn't got anything to do but to look fer trouble. In the meantime, its the duty of all of us to think over these matters deeply for the fellers at the National Capitol will do whatever they think we want in the wind up."

REPORT OF CANE CREEK HOMEMAKERS' CLUB

The Cane Creek Homemakers Club was organized March 4, 1914, by Miss Bab Bell. After having discussed canning, drafting of paterns, receipts, etc., to a house well filled with ladies.

The club now numbers twenty-four members.. Our club is a wide awake, jolly crowd, which is entertained the second Wendesday afternoon of each month by one of its number. Our business hour is from 2 to 3 o'clock.

Our officers are well fitted to their places and are always ready to suggest something new for each meeting that keeps up the interest. After having followed the program sent us, we for a change, had readings of their own selections from different members. These selections were well suited to the club and were very much enjoyed by all. Also exchanging of "tried and true" recipes, was a feature that met with general approval.

Our meetings besides being a pleasantly spent afternoon is one of help to one another as quilting or some other work is usually provided by the hostess.

The greatest thing of the Homemakers Club in our community is that it has brought a hitherto unsociable crowd of ladies together and united them in a sisterly love. Living here always in a neighborhood we never seemed to know each other, only recognized the other with a casual bow, sometimes a "How are you," but now when we meet all is different. We feel free to stop and have a social chat, and each and every one feels kindly toward the other, and all anxiously await the next meeting and feel after enjoying a pleasant afternoon and a splendid lunch that it was a few hours well spent and return home happier by it and feel that our own farm life is not so dull after all, and that being a member of the Cane Creek Homemakers Club is well worth while.

We also have a reporter, who sends te happenings of this club to the editor of Cape Girardeau Weekly Republican, the leading paper of Cape Girardeau County, which publishes the same, and the public in general is well posted in regard to the progress of our club. Committe.

Mrs. H. R. Meier.
Mrs. Wade Clodfelter.
Mrs. Greer Davis.

HOW TO PREVENT "CATCHING COLD"

"Colds are catching," says Dr. I. J. Murphy, of the Minnesota Public Health Association. "People suffering with a cold should not cough or sneeze without holding a handkerchief over both nose and mouth. They should spit only in proper receptacles. Small drops containing millions of germs may be scattered about in coughing, sneezing, or as a result of ordinary conversation. A person with an acute cold should try not to infect others.

"To keep up the general resistance the skin should be kept in a healthy condition. This can be done best by taking a warm bath at bed time at least twice a week and a cold shower or a sponge bath of very short duration every morning.

"At this time of the year most living quarters are kept too warm. The habit of living in overheated rooms lowers the general resistance and injures the membrane lining of the nose and throat so that one becomes easily a victim to a cold, bronchitis, or pneumonia. Fresh air, too, is just as essential in a sleeping room in the winter time as it is in the summer time. It should not be excluded, but there should be a proper amount of clothing

ADDITIONAL CLASSIFIED

S. C. BUFF ORPINGTON EGGS—$1.50 per 15. Baby chicks 20c. each. C. D. Henry, Tipton, Mo.

for protection. Clothing should suit the kind of weather, not the season. In warm spells clothing should be reduced; in cold snaps, increased. Clothing should be reduced when one enters a warm room and put on again when exposed to the cold."

MOTHER'S MILK HAS PROTECTIVE POWER

Unless absolutely impossible, all babies should be nursed by their mothers. Artificial feeding is a substitute which should be resorted to only of necessity, says Dr. M. P. Ravenel of the department of preventive medicine of the University of Missouri. If the mother is suffereing from tuberculosis or some chronic and exhausting disease, the child should be artificially fed. In some cases the mother cannot supply nourishment enough for the child. Her milk is either totally lacking or else deficient in quantity.

The flow of milk usually comes on about the third day, sometimes not until the fourth or fifth day. How should a baby be fed in the meantime? Clearly nature did not intend a newborn baby to have much nourishment. What it needs is plenty of sleep. It should be put to the breast not oftener than three or four times in twenty-four hours. If it becomes sleepless and fretful, a teaspoonful of pure water, cool but not cold, should be given to it. After the flow of milk is established, nursing should be approximately according to the following schedule from the book of Doctor Holt:

First and second day, 4 nursings in 24 hours, 6 hours apart in daytime, 1 nursing at night. From 3 days to 6 weeks old, 10 nursings in 24 hours, 2 hours apart with only 2 at night from 10 P. M. to 6 A. M. From 6 weeks to 3 months old 8 nursings in 24 hours, 2½ hours apart, From 3 to 5 months old 7 nursings in 24 hours, 3 hours apart with only 1 at night. From 5 to 12 months old 6 nursings in 24 hours, 3 hours apart all between 6 A. M. and 10 P. M.

If the mother's milk is insufficient, it may be necessary to supply the baby with some artificial food, but in no case should the child be deprived of the amount of milk its mother can furnish. Entire breast feeding is the best, but when this is impossible, partial breast feeding is much better than wholly artificial feeding. The mother's milk is not only the most easily digested by the child, but seems to contain a ferment which assists in digesting cow's milk, consequently even an insufficient supply should be continued as long as possible. It seems certain, also, that mother's milk has some protective power, as it is well known that nursing children do not contract some contagious diseases as much as those not so fed.

If the mother's milk seems to disagree with the child, the mother herself should be treated. Often her milk can be made nutritious, wholesome and plentiful if a little care and proper feeding is given. She should avoid adverse mental conditions, such as worry, grief, fright and anger, which occasionally so change the milk as to make it positively harmful. Sour, highly salted or spiced food, and alcoholic beverages of all sorts should be avoided.

In case the baby does not seem to be doing well, consult a competent physician, and have him examine both the mother and the child.

GROWING CHICKS NEED GOOD FOOD

Growing chicks require an abundance of food which contains muscle and bone making material. Other things being equal, failure to grow can be attributed to an insufficient food supply, a lack of muscle making food or too little mineral matter such as bone meal.

A chick grows at an enormous rate. At the University of Missouri it was found that a chick weighed at 14 weeks just sixteen times what it did when hatched. If an infant grew as fast, a baby weighing seven pounds at birth would weigh 112 pounds when 14 weeks old. This shows that chicks should be fed liberally and emphasizes the importance of selecting the right kind of food.

Because of the remainder of the yoke sack being drawn into the body at hatching, liberal feeding is not advisable until after the first week. The chick can live for nearly a week on the supply of food it had before hatching. Liberal feeding during this time would retard the absorption of this yoke sack and might cause trouble. When the chick is 48 hours old a few grains of sharp, fine sand should be fed. The sand stimulates the digestive organs and gets them in working order.

The chick's food should consist of cracked grains such as corn, wheat and steel-cut oats, fed in combination with some ground food like bread crumbs, corn bread or rolled oats. At the University the ration for the first week consists of "chick food" fed three times a day and rolled oats the other two. Sour milk is also fed. The acid in the milk is harmful to some disease germs and the milk furnishes muscle forming food. Water with the chill removed is fed in a fountain so constructed that the chicks cannot get wet. After the first week a mixture of bran, shorts and corn meal is substituted for the rolled oats. When milk is not fed fifteen pounds of fine beef scrap and one part of bone meal should be added to every 100 pounds of the mixture. The bone meal will prevent leg weakness. If the chicks are confined, finely cut green grass, alfalfa leaves, onions, etc., will keep the bowels loose and the chick healthy.

Gradually the finer grains can be replaced by coarser. The dry mash can remain as above. All the feed can be placed in hoppers where the chicks may help themselves. Fine grit should always be available. When the chicks have passed the danger point a wet mash daily at about 4 p. m. will induce them to eat more and will result in a more rapid growth.

Eggs can be fed raw in stirring one in some dry feed and feeding this mixture to about sixty chicks. At all times the food must be clean and free from mustiness or digestive troubles are sure to result. The keeping of the quarters clean and sweet is equally important.

Have you organized a farm club in your district? If not, write us for particulars.

A half million dollars for new steel equipment!

The *new* Wabash has scores of new solid steel cars in its Chicago service.

Thousands of dollars have recently been spent to make Wabash more than ever "The Line of Steel."

Of the four Wabash trains daily to Chicago, two are now solid steel, from engine to observation platform; and the other two have steel equipment.

Your next trip will show *you* that every item of train service has been raised to the highest standard, via

the new Wabash to Chicago

New double track has been laid; miles of it. Curves have been eliminated; grades reduced and 90 lb. rails put in—a finer, smoother track doesn't exist.

New Pacific-type engines; 2,000 h. p. giants that pull easily and smoothly and keep trains on time.

New telephone dispatching promotes punctuality and safety; and block signals safeguard every mile of the way.

Altogether the Wabash has reason to be especially proud of its passenger train service and wants you to test it. Trains at

Thomson Bros' Durocs

The other day the writer saw Geo. E. Thomson, the Duroc breeder, so well known to our readers, and he was very enthusiastic over the splendid lot of spring pigs he has coming on. Mr. Thomson stated that most of the pigs this year were by Col. Wonder II, the prize winning son of the champion Col. Wonder, and were living demonstrations of the value of this boar as a sire. Mr. Thomson will be ready to ship spring pigs before long and will be glad to hear from any of our readers who may be in the market.

Cooke and Son's Holsteins

S. W. Cooke and Sons, Maysville, Mo., have one of the best collections of Holsteins in Missouri and at all times are in a position to furnish our readers with breeding stock of high quality. This herd has been built up along the most approved lines, and while large milk yields have been insisted upon Messrs Cooke have also given considerable attention to developing high testing cows. A very desirable lot of young bulls, from high producing cows and sired by Prince Segis Walker Pietertje 123955 are now in offer. This bull was purchased from the celebrated Emblagaard herd, Big Bay, Mich. The records of his dam and granddam and the ten nearest dams of his sire average 29.76 lbs. of butter in 7 days. Of these twelve, seven are 30-lb. cows; two are over 29-lbs.; one over 28-lbs., and one 27.85 lbs. The dam of his sire, Segis Walker Pietertje (butter, 7 days, 27.85 lbs., test 4.73 per cent at 3 years of age) and her four dams, going back to the great cow, Prillys, dam of Beauty Pietertje, hold the worlds record for four and five generations. The records show that only three other families have produced a 30-lb. cow that has produced a 30-lb. daughter and a 30-lb. grand daughter.

Turpin Offers Angus Bulls and Heifers

Robert D. Turpin, Carrollton, Mo., announces, elsewhere in this issue that he has for sale seven extra good Angus bulls, ranging in age from 12 to 19 months. This herd was established in 1882 by W. J. Turpin and has always been maintained on a high and practical basis. The young stuff now offered is well bred, represent several of the most popular and useful families of the breed; is of the right type for profitable beef production and is priced worth the money. In addition to the bulls referred to, Mr. Turpin advises us that he has a desirable lot of heifers for sale. We feel sure that our readers will do well to look this offering up.

Bennett Bros'. Smooth Columbus Polands

Benntt Bros., Lee's Summitt, Mo., whose good herd of Poland Chinas is headed by the great boar, Smooth Columbus, write that they have had excellent litters this spring and have been able to save most of the pigs. Messrs. Bennett are among the most aggressive breders in the state and have succeeded in establishing a herd that ranks with the best. They have a nice lot of fall boars and gilts on hand that are very attractive buys for any of our readers who are looking for something good and priced worth the money.

White Well Pleased with Select Col II

A White, Jr., Palmyra, Mo., is jubilant over the way his great boar Select Col. II is showing up as a sire of the big type Durocs so much in demand. It will be recalled that Mr. White added this boar to his herd something over a year ago and the present crop of pigs is really the first chance he has had to get a line on how Select Col. II would cross on his great lot of sows. The spring pigs by this boar are all that could be expected and are sure to be in great demand. The writer regards Select Col. II as one of the greatest individuals the breed has produced. He has extreme size—easily a 1000 lb. boar—and along with his ability to pull down the scales he is right in every way from his head to his toes. Mr. White has several litters by the boar and also a number by his old standby, Crimson Col. I Am. We will have more to say about this herd in subsequent issues.

Big Early Duroc Pigs

R. L. Hill, Columbia, Mo., now offers a choice lot of early spring Duroc pigs. Most of these pigs are sired by Col. Wonder II, one of the best Duroc boars in the state, Merry Chief, a splendid young boar, and Rexall Col., a good son of Select Col. II. Mr. Hill states that none of these pigs are from litters of less than 11. If you want splendid values in big type, prolific Durocs get in touch with Mr. Hill.

Bridges Bros. Poland China Herd in Fine Shape

Bridges Bros., Slater, Mo., whose herd of Poland Chinas is familiar to the readers of this paper write that everything points to a splendid year for them. They have a large number of spring pigs that represent the very cream of the best blood known to the breed. Aside from the litters by their two splendid young herd boars, Bridges' Bob Wonder, and Long Wonder Timm, this firm is able to offer litters by Big Bob, Long Big Bone, Grand Master, Smooth Columbus, Fessy's Timm, King of Wonders, and other noted boars.

No firm in the state understand handling hogs better than the Bridges boys and we can assure our readers that they will be able to pick some exceptional values from this herd.

The herd is immune and satisfaction is guaranteed—and our readers can depend on statements made by this firm. We would saggest to those who are interested that they write this firm now and ask that they reserve a good boar to be shipped when old enough.

Auchenbrain Good Gift 15487, Grand Champion Ayrshire bull at Iowa State Fair 1915, also a winner at National Dairy Show, Waterloo Dairy Show, Iowa and Minnesota State Fairs, and the largest Canadian exhibitions during the last five years.

POLAND CHINAS

Smooth Columbus
THE BOAR THAT PUT MISSOURI ON THE MAP. HEADS OUR HERD

SMOOTH COLUMBUS BLOOD has held the record in Missouri for two years—it will do it again next year. Fall pigs, either sex, by this great boar, now offered for sale.
BENNETT BROS. R. 5, LEE'S SUMMIT, MO.

PIG CLUBS FOR MISSOURI

Every boy should have something to do during his spare time which will pay him for his work and interest him in some definite line of operation. Plans for pig feeding contests which will tend to do this have just been announced by the Missouri College of Agriculture. Each boy taking up the work will take a pig or litter of pigs at weaning time and, keeping records of weights and feed fed, make them ready for market in his own way. This procedure is going to make some people ask questions of "how and why" some boys get bigger gains and some cheaper gains than others. At the close of the contests these questions will be answered by the boys who did the feeding. In those counties where fairs or roundups are held the pig feeding contests should close with a pig show open to all pig club members. Details of these exhibitions have not been worked out, but there is evidence of much interest in this phase of the work in many localities at this early date. When taking up the work the boys will receive suggestions regarding the feeding and management of the pigs.

In addition to these, from time to time they will receive seasonable hints regarding best practices in making their pigs ready for market. None of these feeding directions need be followed unless the feeder cares to do so.

While pig club work is new to Missouri it has been successfully conducted in other states. All that remains to make it a success in Missouri is the assistance and support of every breeder and feeder of hogs. Many breeders have already offered their assistance in furthering this project but we need more such enthusiasts. More than that we need men who are in the business who will do things among the boys. Local leaders are needed to keep the boys in line and working. If the right kind, these men can do more than anyone else in furthering the pig club work because they are on the ground, have the confidence of the boys and know local conditions. However, it is not asked that these leaders do all the work. Upon application, the Agricultural Extension Service will send assistance to start the work whenever six or more boys in any locality signify their desire for the work. This is an opportunity for the hog men of the state to start something, which means more and better business for them and starts the boys right.

The detailed plan follows:

To let boys between the ages of ten and eighteen years learn by actual experience how to feed and care for pigs so as to obtain best results at least cost.

What Pig Feeding Club Members Are Expected to Do

(1) To feed in the best way possible under existing conditions one or more pigs from weaning time until the date of the local pig club show which will be held sometime between October 1 and December 20.

(2) To keep the following records:

(a) Date of begining contest.

(b) Age and weight of each pig when contest starts.

(c) Feed consumed from beginning to close of contest.

(d) Weight of each pig at close of contest.

(3) To show one pig for premiums in the local pig club show.

Deciding the Winners

The awarding of prizes shall be based upon:

	Perfect Score
(1) Rate of gain	20 points
(2) Total net profit	30 points
(3) System of management	20 points
(4) Winnings at county pig club show	30 points

Prizes

Suitable prizes will be awarded at the time of the local pig club show. If possible a state pig club show will be arranged for later and a set of liberal state prizes will be given as premiums. Winners in the local shows are eligible to compete in the state show.

A postal card will bring to every applicant, full instructions and record blanks necessary to start the work.—S. T. Simpson, Missouri College of Agriculture, Columbia, Mo.

OF INTEREST TO BREEDERS

Improving Our Live Stock

Every step taken to improve our live stock means more profit to the producers and it would seem that each step in that direction should be supported by live stock growers but unfortunately this is not true. In the last ten years twenty states have enacted laws which seek to eliminate the unsound stallions and jacks and to prevent fraudulent statements concerning the pedigree of such animals. Hundreds of farmers have patronized breeders who claimed that their animals were pure bred when in fact they were only high grades and not eligible to registration at all.

Then there is the question of unsoundness which has caused the loss of hundreds of thousands of dollars annually to the horse and mule owners of Missouri. The transmission of bad eyes has been one of the great losses but farmers go right along breeding to stallions with hereditary unsoundness of the eyes giving the matter no serious thought until the colts are four or five years old and begin to show up this weakness.

The states of Illinois, Iowa, Nebraska and Kansas all are among the 20 states which have enacted laws regulating the keeping of stallions and jacks while Missouri has not yet done anything along this line and as a consequence has become a dumping ground for unsound stock from the other states. How much longer will we let prejudice stand in the way of our own good in this matter?

One Argument in Favor of the Scrub

No system of farming can be just what it ought to be without the growing of live stock as a part of it.

Land prices are so high that only the best live stock can be expected to bring satisfactory returns. Some of the reasons why well-bred live stock should be grown are, that it takes longer to grow 100 pounds of scrub than it takes to grow 100 pounds of well-bred stock, and the scrub will eat as much each day as the well-bred, and he has to eat more days to reach the same size. Those extra days feed, then, are all lost. The only thing that anybody might argue as in favor of the scrub is that he affords the feeder a greater amount of exercise.

The scrub takes as much barn room as the well-bred—and he has to use the room longer. The well-bred animal makes you proud of your work, you take better care of him, and a wellbred animal simply makes the man a better farmer.

There is but one possible argument in favor of the scrub, and that is, that when he has gone to market and you have the money for him it makes a lighter load and does not wear out your pocket so badly.—Sam Jordan.

What Is the 400-pound Cow Worth?

In this country the conditions are such that any mature cow showing a normal year's production of an amount under 200 pounds of butterfat should be eliminated from the herd. A full-sized herd of such cows on an intensified dairy farm will not permit sufficient profits to encourage one in the dairy business. Two-year old heifers should yield at least 150 pounds of fat; three-year-old heifers, 160 pounds; and four-year-old animals, 180 pounds. Inquiries are often received as to which is the best cow to buy, viz: one that produces 400 pounds of butterfat in a year or one that produces 250 pounds. The following figures are of interest in this connection:

The 400pound cow can be bought for $200. The annual value of her product at 35 cents per pound of fat would be $140.00. Such cows usually eat about $60.00 worth of feed annually, so that the profit above feed would amount to about $80.00. In two and one-half years, therefore, the 400-pound one would pay for itself, and in five years would give a profit of $200.

The 250-pound cow usually sells for about $75.00. The annual value of her product at 35 cents per pound of fat would be $87.50. The feed cost runs about $50.00 a year, thus leaving an annual profit of $37.50. In two years the 250-pound cow will return its cost, and in five years will show a profit of $112.50.

In addition to these values one must consider the value of the heifers from each class of cows. As a permanent proposition it is the most important matter to be considered. Offsprings from the best cows are fundamental for profitable and permanent dairying. This fact is most difficult for the average dairyman to realize. Rather than dispose of his common cows and purchase at least a few good ones, he prefers to plod along for a lifetime, apparently under the impression that something will develop to justify his judgment.—D. K. Sloan.

Agricultural Exhibits

"Tom and Jim both had good Jonathans, but Tom showed a peck in a bushel box, a dirty one at that—but Jim took a half bushel box, lined it with nice, clean, white paper, packed the fruit evenly, and the box was just full. Tom sees at once why Jim beat him, yet both lots of apples might have been equal in quality. So the farm display should teach the best methods of preparing the products for the market. It should be evident that to grow good stuff is not the sole end of farming!"

The above quotation is from a bulletin just received from the State Board of Agriculture giving information about holding farmers' institutes, agricultural and live stock exhibits. Show me a community where the people maintain a good, live farm club and hold an agricultural and live stock exhibit once a year and I will guarantee that you will not find much of the land for sale in that neighborhood.

Feeding Grain to Cows on Pasture

Does it pay to feed grain to cows on pasture? The results obtained at the Missouri Agricultural Experiment Station indicate that it depends largely upon how much milk the cows give and how good the pasture is. If a cow is producing less than a pound of butter each day the necessary food can be obtained from a good pasture. If she produces more than this some grain can be fed with profit. This means that a Jersey cow should be able to get enough feed from grass to make about 20 pounds of milk daily and a Holstein about 25 to 30.

It will pay to feed grain to all giving above this amount as it becomes impossible for the animal to gather sufficient feed in the form of grass. A cow giving a pound and a half of butter daily should have about five pounds daily and for two pounds of butter, give seven or eight pounds of grain. When not more than four or five pounds of grain are fed it can be all corn. If more than this is needed, some bran or a small amount of cottonseed meal should be added. These recommendations hold good only when pastures are good. In late summer it will often be necessary to feed more grain to high-producing cows or to give some silage or green feeds to help out the pastures.—C. H. Eckles.

Thumps and Scours in Pigs

If scours appear in spite of all precautions, the following treatment has proved valuable to the Missouri Agricultural Experiment Station. Reduce the sow's feed, clean up more thoroughly than before, and give the sow a tablespoonful of sulphur in each feed for several days. It is also well to give the sow a good dose of Epsom salts. If practicable, each pig may be given a tablespoonful of castor oil, or Epsom salts, and charcoal should be provided in any convenient way. If no cheaper charcoal can be secured, it can be supplied by starting fires of cobs, and then putting the fires out before they burn out.

Thumps in young pigs result from too much feed, or too little sunshine or exercise, or both. The remedy is to reduce the sow's feed and compel the pigs to take plenty of exercise in the open air and sunshine. This treatment is only effective for pigs that have not been weaned, since thumps in older pigs is usually caused by trouble in the lungs or bronchial tubes.—L. A. Weaver.

JERSEY CATTLE

JERSEY CATTLE

Bulls ready for service. They are sired by the Owl's Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.

Wm. H. Bruns & Son, Concordia, Mo.

JERSEY BULL CALVES

I have three extra fine ones for sale. Sired by Stockwells Champion. He has won 29 first and Champion ribbons at the leading State Fairs. Calves are out of very high producing cows. For breeding, etc., writ.

J. B. SMITH Platte City, Mo.

SUNSET JERSEYS--TRIO

Two fancy heifers (both bred) and a fine bull, all the the famous Blue Belle—Golden Rosebay breeding. I will sell this trio for $250. This price cannot be equalled anywhere for such stock. Send for circular, description of herd, production, etc.

The ENNIS STOCK AND DAIRY FARM, Horine Station, Mo. (Just south of St. Louis)

HOLSTEIN CATTLE

Dutchland Sir Hengerveld Rag Apple 99771

A few choice bull valves out of heay producing dams sired by the above famous bull for sale.

BLACK AND WHITE FARM
Baden Station, Mo.
Tel. Colfax 1812 R. R. 30

IN MISSOURI

Eight Bulls, 2 to 8 months, $100 to $175 each. Always have a few good cows and bred heifers for sale. Nothing but registered Holsteins.

S. W. COOKE & SON, MAYSVILLE, MO.

HOLSTEINS

Young bulls and heifers from A. R. O. cows. Sired by Sir Korndye Imperial 53683. Eighty per cent of herd have A. R. O. records. Inspection invited.

M. E. MOORE & CO., Cameron, Mo.

ANGUS CATTLE

Angus Bargains

Registered bulls and heifers. The market topping kind. Leading families represented. Priced worth the money and satisfaction guaranteed.

Also Poland China Hogs.

J. M. JONES, R. F. D. 3, EVERTON, MO.

ANGUS CATTLE

Herd founded 1904

Young stock sired by Dean's Eric 139686. Also offer splendid herd bull for sale. Every one the right kind and priced to sell.

V. E. LAWRENCE, SALISBURY, MO.

Aberdeen-Angus

I am offering a number of young bulls, cows and heifers—good individuals and well bred. Also some extra good Poland China Hogs at moderate prices.

J. D. Blackwell - Fayette, Mo.

Aberdeen-Angus Cattle

I am offering 7 well bred bulls from 12 to 19 months old. Good individuals, and priced to sell. Also a few heifers. Get my prices.

ROBT. D. TURPIN, Carrollton, Mo.

100 EARLY O. I. C. SPRING PIGS

10 GOOD FALL GILTS

Guarantee and pedigree accompanies each sale. This herd has been exhibited at World's Fairs and State Fairs for years, so that most of our pigs have prize winners on both sides of their pedigrees. We can furnish pairs and trios, no kin. We are making bargain prices on early orders. Write us today. Address.

S. D. & B. H. FROST,
Box H. Kingston, Mo.

WHITE ANTS DESTROYING BUILDINGS

Our attention has recently been called to the damage done several buildings here in Columbia by the "white ants" familiar to most of our readers, no doubt who have seen them in dead trees, old rails, bridge and foundation timbers and other similar places. The experts tell us they are usually found where there is moisture but in the buildings we have examined here in Columbia that were badly infested with them, the houses were on good foundations and the timbers that had been destroyed were on a dry wall, at least two feet above the surface of the ground. In two of these houses which were apparently in a good state of preservation, had been kept well painted, there was a basement which kept the foundation timbers dry but in both houses the foundation timbers 2x10 material was honey-combed from end to end by the white ants and the timbers could be picked out with the hands. The foundation timbers and the lower ends of the studding were destroyed so that no support was given the building. The damage was discovered only when the "ants" had eaten through the siding in places and exposed their nest.

It would be well for all our readers to carefully examine the foundations of all buildings to see if these pests have a hold for there is considerable danger that buildings weakened in this way may be blown to pieces in a wind storm that would not harm a sound building. The United States Department of Agriculture in a recent publication says, tremites or "white ants" are frequently the cause of serious damage to buildings and occasionally to trees and crops. They are not really ants but owe their appearance which, except in color, superficially resembles that of ants. Like ants, too, they live in large colonies usually located in dead trees, in the foundation timbers of buildings, in wood that is in contact with the ground, or in underground passages in the earth.

In the eastern and southern portions of the country, damage from these insects to foundation timbers, flooring in basements, and other woodwork is common and sometimes serious. It is only occasionally, however, that living vegetation is attacked and then principally on recently cleared land where there is much decaying wood and humus in the soil. An infestation of corn in the prairie region of Kansas is reported to have been due to the presence of enormous numbers of the insects in the heavily sodded soil, but, says Bulletin No. 333 of the U. S. Department of Agriculture, a professional paper by Thomas E. Snyder which reports in detail on the economic importance of termites in the United States, "it should be borne in mind that such damage to living plants is usually occasional and then only local, and not in general a serious problem."

The damage that tremites do to buildings is more important. Many of the buildings in New Orleans recently demolished by a hurricane were found to have been mined by insects, probably by termites, and thus seriously weakened. The termites frequently honeycomb beams, flooring, walls and other woodwork, even as high up as the second and third floors of buildings. They obtain an entrance through underground passages, extending their subterranean galleries for comparatively long distances. Frequently the damage is not discovered until the floors have settled or the joists collapsed. In such cases, extensive repairs and the removal of the damaged timber are often necessary. All wooden farm buildings are liable to infestation as, in fact, is any timber that comes in contact with the ground. Bridges, telephone and telegraph poles, hop and bean poles, mine props, fences, woodwork in wells, wooden silos, beehives, and lumber piled on the ground have all been seriously damaged in this way.

Once they have gained entrance to a building, the termites frequently prove very destructive to many kinds of material stored in it. In houses they destroy furniture, wall paper, books, fabrics, clothing, shoes, leather goods, and food that is stored in dark, damp basements.

To prevent their attacks, the foundations of buildings and the basement floor should be made entirely of brick, stone, or concrete, and no woodwork should be in contact with the ground. This precaution is recommended particularly for the Southern States. Beams or joists should not be imbedded in concrete, as a crack will provide a means of ingress for the insects. Books, documents, and other material susceptible to attack should not be stored in unventilated rooms where they may become moist or moldy. When a building has already become infested, the only effective remedy is to tear out that part which harbors the insect and to rebuild it in such a way as to prevent future invasions, i. e., by substituting rock foundations or foundation timbers impregnated with coal-tar creosotes.

Certain woods, however, are known to be resistant to tremites. Black walnut and persimmon, for instance, among the cabinet woods, have this quality and several of the cedars and the southern bald cypress are both resistant and durable in contact with the ground. In other woods resistance for varying periods, depending upon the method of treatment, may be obtained by the use of chemical preservatives, the most effective of which are coal-tar creosotes.

In nurseries and orchards, "white ants" have frequently proved troublesome. In orange groves they have been known to eat away the bark from the base of the tree and have done similar damage to deciduous fruit trees in the Southern States and in California. Cases are on record also in which they have been troublesome in vineyards and have injured pecan, chestnut, and walnut trees. Dead timber in forests rapidly becomes unmerchantable when attacked by the insects. Injured trees, especially the oak and chestnut, suffer from attacks upon their roots and the lower part of their trunks.

Because the termites are found chiefly in recently cleared ground, this should be avoided in planting nursery stock. Rotation of crops will prevent serious damage on the farm. In greenhouses, iron frames and concrete work should replace wood as much as possible, and what woodwork is used should be impregnated with bichloride of mercury.

Ownership of The Missouri Farmer

In accordance with the law enacted by Congress which requires newspapers and magazines to file a statement showing the name of the editor, business manager, the owners of the publication and the names of any bond holders, mortgagees and other security holders, The Missouri Farmer has filed the following statement with the Postoffice Department: The managing editor is Geo. B. Ellis. The business manager is William Hirth. The Hirth Publishing Company, which owns The Missouri Farmer, is incorporated for $20,000 divided into 200 shares, 189 of which are owned by William Hirth and 10 shares by Lillian Hirth.

The Kingdom of the Subscriber

In the development of the telephone system, the subscriber is the dominant factor. His ever-growing requirements inspire invention, lead to endless scientific research, and make necessary vast improvements and extensions.

Neither brains nor money are spared to build up the telephone plant, to amplify the subscriber's power to the limit.

In the Bell System you have the most complete mechanism in the world for communication. It is animated by the broadest spirit of service, and you dominate and control it in the double capacity of the caller and the called. The telephone cannot think and talk for you, but it carries your thought where you will. It is yours to use.

Without the co-operation of the subscriber, all that has been done to perfect the system is useless and proper service cannot be given. For example, even though tens of millions were spent to build the Transcontinental Line, it is silent if the man at the other end fails to answer.

The telephone is essentially democratic; it carries the voice of the child and the grown-up with equal speed and directness. And because each subscriber is a dominant factor in the Bell System, Bell Service is the most democratic that could be provided for the American people.

It is not only the implement of the individual, but it fulfills the needs of all the people.

Polarine and Dependability Go Hand in Hand

FRICTION REDUCING MOTOR OIL

Use Polarine and your car will stay in service summer and winter. You won't have to lay it up for repairs caused by excess friction.

Polarine covers even the remotest reciprocating surfaces, reducing friction to a minimum and enabling your engine to deliver to the rear wheels the maximum of power it is capable of developing.

Polarine flows at zero and maintains the correct lubricating body at any motor speed or temperature.

Polarine is a dependable oil as may be attested to by the fact that 450,000 motorists are using it in the Middle West alone. Polarine sales are increasing at the rate of more than one million gallons per year.

The Standard Oil Company recommends its use for any type or make of standardized automobile engine.

Order a half barrel today. It costs less that way than in smaller quantities.

BETTER FARMING BETTER FARM HOMES BETTER CITIZENSHIP

THE
MISSOURI FARMER
COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE
AND THE MISSOURI EXPERIMENTAL STATION

LIBRARY
College of Agriculture
University of Illinois

Are You Doing Your Share?

In response to the persistent appeal which The Missouri Farmer has made during the last few months, hundreds of little school district Farm Clubs have been organized all over the state—and not only are these splendid little organizations saving a lot of money for their members but they are fostering a more kindly community spirit. As Mr. Fry of Tipton says in an article elsewhere in this issue, "I am sure there is a friendlier feeling, more co-operation and more neighborliness among our farmers than ever before. I have been road overseer for a number of years and I have had much less trouble in getting help than in former years." I don't doubt that scores of other leaders in this splendid movement could tell a similar tale. Again, in the same article he says, "Our members voted unanimously to keep on meeting regularly all summer long." Now, my friend, isn't this sort of thing truly worth while? Don't you think you ought to pull off your coat for such a program in your own school district?

And let me impress upon you that it is not so much a question of dollars as of good citizenship. It is a great privilege and a duty to play a real man's part in the World. An ox can toil and live and eat and die. First, there is the duty which we owe to our loved ones who must look to us for protection not only today but who have a right to expect us to safeguard their welfare in the years to come. The yoke of oppression is always hewn in the generation that precedes the one which is compelled to wear it. What will the farmer boys and girls of the future have a right to think of a race of fathers whose indifference permitted a flock of hungry vultures in the market place to destroy their opportunity for owning splendid farm homes of their own in the years to come?

You say you are not getting a "square deal"—that there are those who set an arbitrary price upon the fruits of your sweat and toil. You sigh as you think of the mortgage which grows larger year by year while the fertility of your soil is growing less. You silently confess to yourself that as time rolls on the vigor which in other days enabled you to battle early and late in the fields without fatigue is slowly but surely slipping away from you—and yet notwithstanding all these things you keep on idly drifting down the current of time. You make no effort to arouse the latent manhood which God Almighty has implanted within the breast of every man worthy the name. How much greater is the service which you are contributing to your community or society in general than the ox who merely toils and lives and eats and dies?

Don't misunderstand me. I am no pessimist or prophet of gloom. I think the World is a splendid place to live in and I love every beautiful flower that grows in it and listen in ecstacy to the song of every bird. On every hand we hear the gentle voices of sweet women and the golden prattle of little children—and I love the angels which are supposed to inhabit the "Beautiful Isle of Somewhere" because I believe they are like these other angels who move among us here on Earth. But it is because all these things are so splendid and beautiful that I want those who read this paper to play the part of real men—to leave the World a little better than they found it—to help solve the great burning questions of our time—to demand their rights not only because of the dollars involved but because this is the true shibboleth of good citizenship—to refuse to be human non-entites at a time when mighty changes are shaking loose the accummulated dust and cobwebs of the centuries and when your Country has a right to demand that you take a real man's part in the affairs of men. It is the farmer who has caught the real meaning of the great fight which The Missouri Farmer is making for farmer organization who shouts to his neighbor across the fence and says, "Lets do something!" who is blazing the way for a greater American Agriculture and for a farm home which shall be free and untrammeled in the years to come.

WIREWORMS DESTRUCTIVE PESTS

True wireworms are reckoned by specialists in the United States Department of Agriculture as among the five worst pests to corn and among the twelve worst pests to wheat and oats. They attack many other crops as well, however, notably potatoes and sugar beets, and are considered one of the two most difficult groups of insects to control. To combat them successfully it is essential that the farmer should be able to recognize the various species and to distinguish them from other insects of somewhat similar appearance. To assist him in doing so the Department of Agriculture has just published Farmers' Bulletin 725, "Wireworms Destructive to Cereal and Forage Crops," by J. A. Hyslop.

Wireworms are the young or worm stage of several kinds of hard-shelled beetles, popularly known as "click-beetles," "skipping jacks," "snapping beetles," etc. In various parts of the country the name is incorrectly applied to "thousand leggers," webworms and other insects. The true wireworms, though differing greatly in size according to kind, are always elongate, more or less cylindrical, and with a highly polished skin. They have three pairs of short legs near the head end of the body and are usually yellow or reddish brown in color. Several of the most destructive varieties are described in the bulletin already mentioned. One or more of these are found in practically every part of the United States and much of the reseeding and replanting that farmers have to do is made necessary by their ravages. As each variety has its own habits, different methods of control must be used for the different groups.

Wheat Wireworms of the Norteast and Middle West

This wireworm is pale yellow, cylindrical and shiny. When full grown it is about one inch in length and about as thick as the lead in a pencil. It can be readily recognized by the two dark spots near the base of the tail. Normally it feeds upon grass roots and produces no disturbance in the meadows. When the sod is broken for corn, however, the insects gather in the drill rows or hills and destroy the seed or eat off the roots of the plants which sprout. In this way the crop often is absolutely destroyed. It happens frequently, however, that during the first year the worms feed upon the down-turned sod, and do not do their greatest harm to the cultivated crop until the second season. They require three years to turn into beetles. In addition to wheat this variety of wireworm feeds upon corn, potato tubers, carrots, turnips, and the underground stems of string beans, cucumbers and cabbage.

To control the wheat wireworm land intended ofr corn should be plowed immediately after the first cutting of hay, usually early in July. Throughout the remainder of the summer this land should be cultivated deeply. Badly infested land in corn should also be deeply cultivated even at the risk of slightly root pruning the corn. As soon as the crop is removed the field should be very thoroughly tilled before sowing to wheat. Wheat fields that are not seeded to other crops should be plowed as soon as the wheat is harvested. This kills the worms by destroying their food supply and preventing proper hibernation. Where circumstances permit, interposing between sod and corn such crops as field peas and buckwheat, which are not severly attacked by wireworms, will materially reduce the number of worms in the soil when corn is planted.

Corn Wireworms in the East and the Mississippi Valley.

Corn wireworms damage cereal and forage crops in the Middle Atlantic States, the New England States, and the Mississippi Valley. They are reddish brown in color, about 1¼ inches long, cylindriacl in shape, and have three slight lobes or prejections on the tail. These insects spend a considerably longer time in the soil than the wheat wireworms. In some cases they have been known to live in the ground as long as six years. On the other hand, they are almost exclusively confined to poorly drained and heavy soils. For this reason heavy liming and thorough tile draining will undoubtedly prove beneficial in their control. The thorough cultivation of waste land, especially along drainage ditches and creeks during mid-summer, and the deep cultivation of crops and fallow land are also recommended.

FOR NEARLY 3/4 OF A CENTURY

DOMINANT PROGRESS

Has made the Red River Special the Threshing Machine of the Age

Since 1848 the Nichols & Shepard Company has been interested in one line of endeavor only—the making of machinery for threshing grain.

They started their career with a revolutionary improvement in the threshing process that put them in the lead—continued inventiveness of the same bold character has kept them at the front.

WHAT HAS BEEN ACCOMPLISHED?

By **Beating Out the Grain**, a principle that has never been abandoned since originated by this company, more separation, better separation, faster separation, cheaper separation, are all combined in this one machine.

Owning or using a Red River Special rig, you can do more than you can do with any other known make of threshing machine, and it is so written as a part of your purchasing contract.

What do you expect to get when you select another kind?

You ought to read your own neighbor's opinion of a good job of threshing. You'll find it in the Home Edition of the Red River Special paper. Write for a copy and post up. The Big Catalog will be sent also if you ask for it.

LYONS PRACTICAL FARM PAPERS

I find that a man of 60 years cannot do as much hard work as one of 40, also that an "old feller" is apt to have more ill health than a younger one.

This is a very backward spring with us, oats and clover seeding being delayed as late as April 23, and on May 1, fully one third of the plowing to do.

We had eight acres of land where corn grew last year, to be broken again this spring, and for the first time in years we burned eight acres of heavy corn stalks.

I know that this is bad farm practice, but some times a man has to do a thing he does not like to, and the stalks were so heavy that burning was the only way we could get rid of them.

It is also bad practice to follow corn with corn, but this land had lain in clover and timothy six years, was pastured lightly, and we will use a commercial fertilizer on the corn and have given the plot a fair coating of manure.

One of the old man's jobs that fell to me this spring, was planting a new strawberry patch, and 500 fine Dunlap plants are growing, 18 inches apart, in four-foot rows.

The plants were taken from a bed planted May, 1915, each plant spaded up with a ball of dirt to its roots, and they scarcely showed the effects of transplanting.

My spade was made at home, from a foot of the middle leaf of an old buggy spring with three rivet holes drilled through it, riveted in a slot sawed in the end of an old fork handle, and it comes handy for uprooting dandelein, docks and other tap rooted plants, as well as for use in transplanting.

Three years ago I set 50 apple trees, five rows of ten trees each, and a rearrangement of fields made two rows of five trees each undesirable so they were removed this spring.

The Wheat Yield Tells the Story
of Western Canada's Rapid Progress

160 ACRE FARMS IN WESTERN CANADA FREE

The heavy crops in Western Canada have caused new records to be made in the handling of grains by railroads. For while the movement of these heavy shipments has been wonderfully rapid, the resources of the different roads, despite enlarged equipments and increased facilities, have been strained as never before, and previous records have thus been broken in all directions.

The largest Canadian wheat shipments through New York ever known are reported for the period up to October 15th,

upwards of four and a quarter million bushels being exported in less than six weeks,

and this was but the overflow of shipments to Montreal, through which point shipments were much larger than to New York.

Yields as high as 60 bushels of wheat per acre are reported from all parts of the country; while yields of 45 bushels per acre are common.

Thousands of American farmers have taken part in this wonderful production. Land prices are still low and free homestead lands are easily secured in good localities, convenient to churches, schools, markets, railways, etc.

There is no war tax on land and no conscription.

Write for illustrated pamphlet, reduced railroad rates and other information to

GEO. A. COOK,
2012 Main Street, Kansas City, Mo.
Canadian Government Agent.

No passports are necessary to enter Canada

A trench was dug around the trees and about ten inches from them with mattock and spade, and with a stiff inch and a half plank eight feet long this ball of earth and the roots it held was pried loose, loaded onto a shin boat and hauled to the new location.

Then we dug holes big enough to take in the ball of dirt and the roots, pruned the trees well, and every one of them will grow.

It took two of us and the old mare half a day to move the trees forty rods, and I figure that they are worth $5 each more than small trees, such as we set three years ago.

My father was an expert orchardist of the old school, and he did most of his apple tree pruning from the time the sap started in spring to the first of June, but I like to do this work at least two weeks earlier, as I think earlier pruning does not cause so many waterspouts.

At this date, May 2, there is no corn planted here and perhaps 25 per cent of the plowing to do. We have one field however, ready to harrow again and plant as soon as it warms up, another field all broken but three days work. Wheat is very poor, and oats just well up. Corn is selling at 85, wheat $1.25, hogs $9.30, good cows up to $75, horses $100 to $350, but horse prices are falling off some.

Gardens backward, potatoes small.

C. D. Lyon.

Remedy for Stringy Brine

Warm spring days often cause the souring of the brine in which meat is being cured that has been butchered the latter part of winter. The most common kind of souring shows itself in a string of white mold which floats near the surface and gives rise to the term of ropy or stringy brine. The Nebraska College of Agriculture says that such meat should be removed from the brine at once and be soaked in fresh water and be well scrubbed. The meat may then be repacked and new brine be added. If thoroughly boiled the old brine may be used, but the new brine is safer and is considered almost as cheap.

The danger of spoiling may be reduced either by lessening the amount of sugar or by increasing the amount of salt.

To Inoculate Seed

Coating the seed of legumes with inoculated soil before planting is a simple method of insuring soil inoculation at slight cost. County agents in Illinois have found ordinary furniture glue effective in holding particles of inoculated soil to the seeds. This method gives each individual seed some of the particles of inoculated soil which it carries with it when it is planted. The scheme requires but a small amount of inoculated soil and costs but a few cents an acre. The method is described in Farmers' Bulletin 704 of the U. S. Department of Agriculture as follows:

Dissolve two handfuls of furniture glue for every gallon of boiling water and allow the solution to cool. Put the seed in a washtub and then sprinkle enough of the solution on the see to moisten but not to wet it (1 quar per bushel is sufficient), and stir th mixture thoroughly until all the see are moistened.

Secure the inoculated soil from place where the same kind of plant as the seed are growing, making sur that the roots have a vigorous devel opment of nodules. Dry the soil in th shade, preferably in the barn or base ment and pulverize it thoroughly int a dust. Scatter this dust over th moistened seed, using from one-hal to one gallon of dirt for each bushe of seed, mixing thoroughly until th seed no longer stick together. Th seed are then ready to sow.

The Missouri Farmer

OLUME VIII MAY 15, 1916 NUMBER 10

A National Council of Agriculture

By William Hirth, Publisher

'here isn't a farmer who has read e Missouri Farmer in an even cas- manner during the last year who sn't realize that, without in any ree neglecting the fight for better ming methods, this paper believes problem of a "square deal" in the rket place to be the overshadowing ricultural issue and that therefore question of farmer organization i co-operation deserves the prefer- e over all others at this time. It vitally important that the farmer ll employ the best thought in his ming operations and puruse only best farming methods—but it is ially important that when the years eat and toil is at an end he shall ve something to show for the ought and methods which he has s employed. In other words, there ould be a genuine reward for better ming and never will our Agricul- al colleges or the initiative and ift of individual farmers have a r show so long as a manipulated rket can destroy in the space of a w hours the fruits of the patient l of many months. That is why e Missouri Farmer is encouraging organization of a Farm Club in as arly as possible every school district Missouri—and we do not propose cease in our efforts until we have monstrated that this can or cannot done. Once the school districts are ganized and on a firm footing it will an easy matter to perfect county— d finally a powerful, closely knitted gether State Farmers Ass'n which ll be able to deal in a big and effec- e manner with the larger problems at confront us.

However, in our humble judgment e time has come when this great vement needs a powerful directing ency from a Nation-wide standpoint when, by some means, the machinery ould be provided which will carry is great fight into every state in e Union simultaneously—for even ough the farmers of Missouri should rfect a powerful State organization would not be able to make its influ- ce felt in great matters of Agricul- ral policy which are not merely Na- n but World-wide in their scope. put it on a circumscribed basis, the rmers of Missouri could hope to ac- mplish little in affecting Live Stock arket conditions unless the farmers at least Iowa, Kansas, Nebraska, inois and Indiana were solidly be- nd them. With these great live stock oducing states united, there is little estion but what substantial head- ay could be made—and yet why not nstruct machinery which will enable to put well matured plans into fect in Ohio as well as in Texas and the Dakotas as well as in Missouri? hy should there not be some great ntral agency through which the farm- aders of the entire Country can speak a sort of "Clearing House" through hich the best thought concerning the great pertinent farm problems of the day can be assembled and perfected?

Real Machinery Needed

Notwithstanding that Agriculture is the great basic industry of the Nation upon which the prosperity and well-being of all other classes finally depends, we have never had the machinery through which definite, Nation-wide Agricultural policies could be perfected or promulgated by farmers themselves. Within the sphere marked out for them, the Federal Dep't of Agriculture and the various Agricultural colleges have been doing splendid work—but, after all, their true function is to **help** rather than **lead** the farmer. To attempt the latter would largely endanger the success of the former—for in the last analysis that industry which must be both taught and led is too weak and fragile to survive, it makes no difference how painstakingly a guardianship may be exercised over it. Governmental and state agencies are supported out of the public treasuries—and this is another reason which disqualifies them for the virile, not to say fighting farm leadership necessary at this time.

Practically every great industrial interest in the Nation has provided the machinery through which those vitally interested in it may be brought together within 24 hours—and however much they may fight for individual advantage at other times, in the hour of danger they present a solid front to the enemy. Let Congress attack the great steel or other large industrial enterprises of the Nation and within an hour the telephone and telegraph are brought into play—and strong men start for the capitol as fast as trains can carry them. Not only that, but at times when no danger threatens the leaders of all other great industries are planning for their common welfare and seeking means which will broaden the outlet for their produtcs and cheapen the cost of production, etc. And this spirit of self preservation deserves the highest commendation. But not so with the farmer. He is the brother to the ox and has neither the agencies through which he can speak for himself nor those whose understanding enables them to speak intelligently or authoritatively for him —and as a result he is the victim of whoever cares to grow fat at the expense of his sweat and toil.

Is it any wonder that the Packers Combine uncerimoniously tells him what it will pay for his hogs and cattle—that it holds the great live stock industry of the Nation in the hollow of its hands? Is it any wonder that gambling in grain futures continues to fix a ficticious value upon his crops?

In this connection, I don't want to be misunderstood. I don't want to hold out the idea that the farmer is a National cripple or invalid who is entitled to special privileges. If he is being "run over," the fault lies almost altogether with himself. What I am trying to get the farmers who read this paper to realize is that we are living in a World where everybody is chiefly looking out for himself, for this is human nature—and that it is his duty to take care of himself, not only for his own sake, but for the sake of the millions of consumers who cannot escape so long as the farmer turns the things which hold body and soul together over to a lot of industrial brigands who take as much delight in fleecing the consumer as the producer. We have never had a President who comprehended the true importance of Agriculture as a National industry—and the same is true of the average Congress which is made up mostly of lawyers who, even though they are sincere in their desire to help the farmer do not undetsand at close range the great farm problems of the day. Assuming that these general conclusions are, in the main sound, it means that the time has come when thinking farmers in Missouri and in every other state must broaden the vision of their horizon—when we must "break into the big league" and take a hand in the formation of National as well as local farm policies.

A National Council of Agriculture

To these ends, we believe the time has come when there is imperative need of the creation of what might be termed a National Council of Agriculture and hence we suggest that Congress enact a measure providing that the President of the United States shall name as members of such a Council one farmer for every 50,000 farmers or fraction thereof in every state in the Union. Since there are something over six million farmers in the United States, this would provide a total membership of somewhere between 125 and 140—considering the augmentation which would come from the fractional representation on the basis of one member for each 50,000 farmers or fraction thereof in the several states.

With 277,000 farmers here in Missouri, for instance, this would entitle us to six members in such a body. We believe that the term of membership should not be for less than six years and that the tendency should be to re-appoint a strong farm leader in order that he could grow bigger and broader as his thought and experience become the more seasoned. In every instance an effort should be made to select real farm leaders—farmers who, whether they operate large farms or small ones could bring real constructive thought into the deliberations of such a forum and also that the personnel of the Council should be made up on a non-partisan basis. We would not attach any salary to these positions but would have Congress provide funds out of the public treasury to the extent of paying the necessary traveling expenses and hotel bills for each member for a ten days convention every year at which time the members of the Council could enter upon a thorough discussion of the great farm problems of the day. Provision should also be made for a permanent Secretary, the publishing of reports, etc., and paying the expenses incurred by necessary call meetings of the Executive Committee, etc. In order that the thought and action of such a body of men might be untrammeled, we would have them absolutely independent of any other governmental agency. We do not believe that there is a farmer in the United States who would not sincerely appreciate the honor of membership in such a National Council at the hands of the President and furthermore we believe that every President would strive to appoint only men whose breadth of thought and experience as farmers would enable them to render real service in a forum of such great and far reaching importance.

What Such a Council Could Do

The central thought we have in mind is the creation of a picked National body of farmers who, once every year, can take in hand, thresh out and formulate definite policies with reference to the great pertinent farm questions of the day. At the present time there is in progress in Washington an investigation of Live Stock market conditions. As our readers well know, the National Live Stock Ass'n in its annual convention at El Paso in February expressed great dissatisfaction over the existing state of affairs and pledged itself to raise a fund of $250,000 with which to conduct an investigation. Subsequently, similar action was taken by the Live Stock growers of Texas and Kansas through their respective state organizations. Along about this time Congressman Borland of Missouri introduced a resolution calling upon the recently created Federal Trade Commission to make an inquiry—and so far as we know the matter rests there at this time. That an investigation through a powerful Congressional Committee would have been preferable to one at the hands of the Federal Trade Commission is a view to which we have held from the beginning—but the chief point we wish to cite is that there is no great central authority at this time which can speak for the farmers of the whole Country and which can take a hand in the direction of matters of this kind which involve the very life of American Agriculture. Had such a body of men as the one we suggest been in existence during the last few years, it goes without saying that this great question would not have been abandoned to the hap hazard interest of Congress but that on the contrary a definite and well planned course of action would have been mapped out before any move was made.

Again, there has been the great question of a Federal Agricultural Credit System which has engaged the attention of Congress for a number of years—and should the bill which was enacted some days ago prove satisfactory, this will be true in spite of rather than because of any co-operation which the thinking farmers of the Nation have been able to give to this subject. So, also, there are few more vital problems at this time than an adequate merchant marine which will protect farmers against extortionate ocean freights as well as supply them with enough ships to transport their surplus products to the markets of the World.

Then there are such problems as dealing in grain futures which has long been a source of injustice to the farmer and which nothing short of a powerful Nation-wide effort will ever change. Again, think of the powerful impetus which such a body of men could give to the things for which the Department of Agriculture and the different Agricultural Colleges are fighting—the extent to which they could popularize the needed reform in farming methods?

The Overshadowing Problem

But above everything else, such a National body is needed to help solve the deplorable state of farm marketing conditions which exist at this time and which can never be changed without the adoption of definite, Nation-wide plans. There must be some power which will put an end to the chaos which reigns at this time and which hammers into being a plan that is practical—for until there is some central authority to which the farmers of every state will listen with profound respect we will continue to stumble around amid a babel of sound and half baked conclusions which are as varied and numerous as the sands of the sea. For this one great overshadowing reason alone we believe the creation of some representative authority of this kind is imperative.

Also we must realize that we are living in a radically different World than the one which we knew prior to August 1914—and once the great European tragedy comes to an end it means the introduction of mighty changes which cannot help but vitally affect the American farmer who is, in truth, one of the greatest inter-national business men in the World. Surely the time is here when the best farm thought is necessary, not only in the solution of purely domestic Agricultural questions but in those larger matters which affect the well-being of the great business of farming not only here at home but in every mart and market upon the habitable Globe.

Undoubtedly when peace comes there will be a tremendous foreign demand for the raw materials of the American farm—and if by manufacturing them into the finished product here at home employment can be given to tens of thousands of additional men, thus furnishing a greater demand for the food stuffs the farmer produces on the one hand and paying him a better price for the great leading materials of manufacture on the other, should we not, through some powerful concentrated authority be able to point out and do our part in bringing about these needed changes in the American way of doing things?

We believe that almost from the beginning such a body of men as we have here suggested would become the center of Agricultural attention throughout the land—that their annual conventions would become the rendezvoux not only of the brightest farmers in the Nation but of Agricultural leaders in the scientific world from every state in the Union and that for the first time in the history of American Agriculture we would begin to present a solid front on those great questions which involve the future destiny of ours farms which means, in fact, the destiny of the Republic. With such a great directing power we believe the question of farm organization and co-operation would speedily take definite form in every important farming state. In any event we give the suggestion to our readers for what it may be worth and shall welcome a letter from any farmer candidly expressing his opinion.

HEAVY SILAGE FEEDING REDUCES COST OF FATTENING CATTLE

The University of Missouri recently marketed five lots of two-year old steers which had been fed experimentally during the past winter at the Station farm. The cattle were used in a trial to determine the value of a heavy ration of silage in connection with a high protein concentrate, without additional grain, for fattening two-year old steers.

The cattle used were choice grade Herefords purchased on the Kansas City market in December at a cost of $7.44 per hundred pounds. They were shipped to the feed lots and after allowing a few days in order to obtain a normal fill the experiment started on December 20th. On account of the expense of purchasing, freight and feed the cattle cost $7.64 per hundred pounds at the beginning of the trial. They were fed for 133 days and sold on the Chicago market May 4th. The accompaning table gives the facts of principal interest.

Each lot was fed all of the corn silage and alfalfa hay it would consume from the start. It will be noted that the quantity of silage eaten was much greater in the lots which did not receive shelled corn. In lots 1 and 2 the proportion of shelled corn and cottonseed meal and linseed oil meal was kept at six pounds of corn to one of meal throughout the trial. The cattle were gradually accustomed to the grain ration in the three lots receiving shelled corn. After the first 30 days they were fed all they would clean up within a reasonable length of time. Lots 3 and 4 were started on two pounds per head daily of the high protein concentrate and gradually increased to seven pounds near the close of the fattening period. In these lots the meal was scattered over the silage at the time of feeding in such a manner as to insure its even distribution among the cattle.

Pigs were allowed to follow the cattle in order to save such feed as was wasted by the steers. In Lots 1, 2 and 5 four pigs to the lot were used while Lots 3 and 4 had but one pig each. In figuring the financial results, gain on the hogs was credited to the steers at $8 per hundred pounds. The pig in Lot 3 lost a small amount in weight and this was charged to the cattle at the same rate.

In obtaining the financial results the following prices were used in determining feed costs; corn 70c per bushel; corn silage $4.50 per ton; cottonseed meal $37 per ton; old process linseed oil meal $37 per ton; alfalfa hay $14 per ton. The corn silage was made from corn which would yield approximately sixty bushels of corn per acre. The growth of stalk, however, was heavy and it was not thought to contain an undue proportion of corn.

From the data it may be seen that a larger daily gain in live weight is made where corn is fed in addition to a high protein concentrate with silage and hay. A fairly satisfactory finish was obtained, however, without the corn. The market price received for the additional gain particularly in the case of Lot 1 did not justify the superior finish. It seems from the per cent of dressed beef obtained that the price of $9.60 per hundred pounds for Lot 1 was too low and $9.75 per hundred for Lot 5 was too high in comparison with the other lots. An inspection of the beef in the coolers disclosed practically no difference in the value of the beef obtained from the different lots, although that from Lots 1 and 2 showed a slightly superior finish.

It will be observed that the shrinkage in shipping was no greater in the two lots which ate a large quantity of silage than in the other three lots. All lots had access to timothy hay for thirty hours before loading and the silage was reduced to one-half the last time the cattle were fed in the lots. No treatment other than this was given to avoid shrinkage. All lots were handled alike in shipping.

From this test it appears that the cost of fattening cattle at the prices given can be reduced by the extensive use of silage fed in connection with a high protein concentrate and alfal hay. The total cost of feed per ste fed to Lot 3 was $26.07 and to Lot $27.44, while in Lot 1 it was $40.85, I 2 $38.63 and Lot 5 $33.88. In ratio where corn is fed only in the form silage the hogs are practically elmi nated as a factor in cattle feedi While it is possible that the best fini can not be obtained on fat cattle wit out the addition of corn during t latter part of the feeding period such rations as were fed to Lots 3 a 4, it is possible to make a choi grade of beef without additional co By the extensive use of corn sila and high protein concentrates t capacity of a farm to fatten cattle c be greatly increased and our farmi operations intensified.—H. O. Allis Animal Husbandry Department, M souri Experiment Station.

SUMMARY OF STEER FEEDING TRIAL

Lot	I	II	III	IV	V
Number of steers	6	6	6	6	6
Average final weight in lots, lbs.	1286.94	1249.44	1199.77	1243.05	1206.66
Average initial weight in lots, lbs.	925	923	938	926	912
Average daily gains, per steer, lbs.	2.721	2.454	1.968	2.383	2.140
AVERAGE DAILY RATION PER STEER					
Shelled corn,	15.597	15.242	.....	.....	15.274
Cottonseed meal,	2.600	.....	5.055	.....	.....
Linseed oil meal,	.....	2.540	.....	5.055	.....
Corn silage	17.468	16.466	36.222	37.620	16.263
Alfalfa hay,	3.687	2.267	3.001	4.027	3.897
*Gain on hogs per lot	38.66	51.10	—6.4	3.1	36.33
Cost of gain per 100 lbs. on cattle (crediting gain on hogs at $8 per cwt.)	$10.42	$10.58	$10.15	$8.57	$10.88
Selling price in Chicago	$9.60	$9.75	$9.65	$9.65	$9.75
Percentage of dressed beef	63.53	64.19	62.38	61.33	62.58
Shrinkage per head in shipping, lbs.	48.89	39.44	43.11	39.71	30.00
Net profit per steer	$6.77	$9.32	$9.87	$14.56	$10.53

*Minus sign in Lot 3, gain on hogs, indicates that in this lot a loss was incurred instead of a gain.

AFTER THE BEEF TRUST

During Farmers' Week the Missou Cattle, Swine and Sheep Feeders' A sociation passed resolutions urgi Congress to make an investigation a find out to what extent the Beef Tru was responsible for making prices live stock and live stock products a to pass such laws that would relie farmers of this great menace to t live stock industry. As a result that resolution Congressman Borla of the Kansas City district introduc a resolution in Congress requesti the Judiciary Committee to make i quiry and determine whether or n there was sufficient cause for maki such an investigation.

The Missouri Cattle, Swine a Sheep Feeders' Association was re resented before the Judiciary Co mittee by Judge William H. Walla who besides being a great lawyer a good farmer and cattle feeder. W have not space for the full speech Judge Wallace before the Committ but will give our readers the mo essential points in the address: The are two parties to the proceeding, t cattle feeders and the packers. T great bulk of the cattle of the Unit States are produced by small farme men owning eighty or one hundr and sixty acres. Probably ninety-fi per cent of all the cattle in Ameri are now produced by these sma farmers, and down the centuri farmers have been among the world toilers. Except brakemen on freig trains, Judge Wallace says, farme exceed all others in hardship and e posure. If the thermometer is o hundred in the shade they must lab beneath the blazing sun to gath their crops. If it is twenty belo zero or if there is storm or sleet, it then they must face the storm looking after their stock.

The above picture shows the steers in Lot IV. This group brought $9.65 per pounds in Chicago and made a profit of $14.56 per head. This Lot was fed an avera daily ration of 37.62 pounds corn silage, 5.05 pounds of oil meal and 4.02 poun alfalfa hay. These steers made an average daily gain of 2.38 pounds for the who feeding period of 133 days.

"I have nothing to say" continues the Judge, "as to the environments and habits of the packer—as to whether he lives in penury or opulence, as to whether he lives like Lazarus or like Dives or Croesus but the question logically arises, How are these two parties getting along in the great workaday struggle of human existence? Have their hopes and labors for themselves and their families been turned into ashes; or have they heaped fabulous millions of money? Let the plain truth be told." The story of the cattle feeder is a deplorable one. Most cattle feeders have lost money for several years.

"Not long ago there was prepared for the Interstate Commerce Commission reports from fifty-six farmers in Iowa as to how they succeeded in feeding cattle in 1915, the year just gone by. These reports were sworn to. Fifty-three of these farmers stated under oath that they had lost money feeding cattle in 1915, some of them as much as $19 a head. Only three of them stated that they had made money, and the combined profit of all of the three was only a little over $600. These reports typify the fate of the feeders during the past two years. Thousands of them have gathered their corn, gone to one of our great markets, borrowed money, bought feeders, taken them to their pens, fed them their corn, and then brought them back and sold them to the packers without realizing a cent for their corn or even for the grass they ate. They have gone back home to their families as empty, so far as their small crops were concerned, as if they had lived in the line of march of a devastating army in Belgium or Poland or Servia; as empty as if in their unsuspecting honesty they had fallen into a den of "confidence men"; except that they have not been beaten, as empty as the hapless victim whom the good Samaritan found by the roadside.

"Whether we study natural or revealed religion, it was doubtless the intent of the Creator that the good things of life should be somewhat equally distributed among his creatures. Let us see how the packers have observed this Divine rule. By way of comparing the status of the packers with that of the cattle feeder I present for your astonishment the following table—taken from The Wall Street Journal of January 26, 1916, and showing the capitalization and profits of the packers in 1915. The packers here named are what are known as the "Big Four."

	Swift	Armour
Sales	$500,000,000	$425,000,000
Net profit	14,087,500	11,000,000
Per cent on sales	2.8	2.6
Per cent on stocks	18.7	55.0
Net working capital	62,355,000	56,581,954
Per cent to sales	12.4	13.3
Surplus	45,850,000	98,733,117
Per share	$61	$493
	Morris	**Cudahy**
Sales	$160,000,000	$116,162,000
Net profit	2,321,414	723,642
Per cent on sales	1.45	0.62
Per cent on stocks	77.3	(com.) 17.6
Net working capital	23,768,535	8,224,543
Per cent to sales	14.8	7.0
Surplus	29,510,270	6,050,270
Per share	$983	(com.) $175

You will observe from the above that the net profits for the year 1915 were: Swift, $14,087,500; Armour, $11,000,000; Morris, $2,321,414; Cudahy, $723,642. The per cent on stocks is: Swift, 18.7; Armour, 55.0; Morris, 77.3; Cudahy (com.), 17.6. In studying the question of trusts some years ago I remember that a New York lawyer, who it was said had organized more trusts than any other man in the United States, said that the usual rule was to add four portions of water to one portion of value. If this rule obtains with the packers, and the presumption is it does, you can see what a tremendous money-making machine they have. I invite your special attention to the surplus as given in the above table: Swift, $45,850,000; Armour, $98,733,117; Morris, $29,510,270; Cudahy, $6,050,270. The combined surplus, it will be noticed, of the "Big Four," is $180,000,000. They have this enormous sum after declaring their dividends. Some months since some English envoys were in Ameica engaged in an arduous endeavor to borrow one-half billion dollars for a government on whose possessions the sun never sets; yet here are four business concerns that have a surplus of $180,000,000, and a net working capital of over $150,000,000.00, and loan companies with loans running up into the millions, as will be seen further on.

Judge Wallace then proceeds to show positive evidence that the packers are maintaining a wicked, illegal conspiracy and combination known as the "Beef Trust." The Missouri Cattle, Swine and Sheep Feeders' Association would have Congress investigate the methods of the packers and suppress the great crime against society of which the packers are proven guilty. "It is our hope that when the evidence of this wicked conspiracy is laid bare by the Trades Commission the testimony will be presented to the Department of Justice, which we trust will see that the law is enforced and its supremacy upheld.

"Then, we wish a law passed by Congress which will break up this nefarious system by which a conspirator gives to his co-conspirator, by "wiring" or otherwise, information which prevents the farmer or other shipper from receiving the just benefit which comes from open competition in our great markets—a law which will make this offense a felony only and punishable only by punishment in the penitentiary. What do these multi-milionaires care for a fine? They will grind the face of the hapless feeders of our land and reimburse themselves in forty-eight hours.

"We wish Congress to pass a law making it a felony for men to form a Trust to control the price of meat, a great food product upon which the masses depend for strength and sustenance. Expunge the word "fine" from the statute books.

"Much as we believe punishment is necessary for the protection of society from human greed, we also wish Congress to pass adequate laws to prevent the continuance or recurrence of the awful crime which we have been depicting."

IMPLEMENT TROUBLES

We have been having some unpleasant experience and to tell of it may help others. Among our implements are a check row corn planter and a sulky plow, the first three, and the second two years old, both of which have given us some trouble ever since we had them. Both were sold us by the local dealer and are made at the same factory, but repeated complaint to the local dealer has been without result, and when in Columbus in January, I went to the branch house and lodged a complaint there. The plow did not scour well in some soils, and the planter, while it is almost infallible as to the dropping of corn, did not handle some grades of fertilizer just right, all of which was laid before the manager of the branch house.

He said that he had never heard of our trouble before, and would attend to it at the right time so a few days ago up drove an expert with half a delivery wagon load of parts, and the way he did go after those implements was fun.

An entirely new bottom, with a different shape mold board, was put on the plow, and that expert was not afraid to follow the plow around the field a dozen times, to see if he could make it fail to scour under the very worst conditions he and the driver could devise. When it was settled that the new bottom would scour in any soil we have, he said "where is that —— corn planter you have trouble with?" Then he said several things but represented here by more —— —— spaces, and told us that our planter was one of a few hundred sent out three years ago, with fertilizer attachment that did not work right, that the company had sent the local dealer new attachments to be placed on all such planters and that he had simply failed to pay any attention to our planter.

I am writing this to advise others, who have like troubles, to do as I did. If your machine or implement does not work as it should, and if the local dealer cannot or does not put it in first class condition, write to the factory where it was made, or to the nearest branch house, and tell them of your troubles.

In our case, the firm who sold us the two implements, lost the sale of three planters last year, simply because "Lyon's machine don't work right," and it did not work right because it might have taken our dealer half a day to come to our place and put on new attachments.

C. D. Lyon.

Suggestions for Concrete Tanks

A good mixture for a concrete tank may be made of one part Portland cement, two parts of clean, coarse sand, and four parts of screened gravel or crushed rock. Where neither gravel nor crushed rock is available, use one part of cement to three of sand. If less cement is used than the amount given the mixture will not wear.

The foundation should be about six inches thick, enough so that there will be no danger of heaving from frost. It should be reinforced with woven wire.

The sides of the tank may be reinforced the same as the foundation, care being taken that the reinforcement is placed near the outside wall. Only wire or iron of good quality should be used, as rusted material only fills space and does not reinforce.

There should be continuous reinforcement around corners. Where the wire or other material laps, the laps should be several inches.

The form for the tank should be so made as not to crack the cement when taken apart.

After the forms are removed, the inside of the tank may be waterproofed by applying a coat of concrete paste made of pure cement and water mixed to the consistency of cream.—College of Agriculture.

What is Acid Phosphate Worth?

In the average of 22 years work by the Ohio Experiment Station at Wooster, 21 at Strongsville and 12 years each at Germantown and Carpenter, acid phosphate, used at the rate of 80 to 120 pounds per acre, has returned a little more than 8 bushels of corn for 100 pounds of phosphate, the fertilizer being spread on all the land with the grain fertilizer drill just before planting the corn.

PREVENTION SPELLS PROFIT IN LIVE STOCK RAISING

The task of the management of any business, not only consists in so conducting affairs, that there may be a fair degree of profit, but also that losses may be prevented. In many cases even the profits will take care of themselves if the losses can be eliminated.

The farmer as a rule has been very slow to learn the lesson of loss prevention, because in the first place he has so commonly been led to look upon himself and vocation as upon something to which the laws and rules of ordinary business do not apply and in the second place losses are so often due to the forces of nature over which he thinks he has no control, that he does not worry much about it and simply takes a gambler's chance.

Under the condition of the predatory farming of the pioneer, when land was cheap and plentiful such an attitude was no particular disadvantage but with the tightening up of agrarian economic conditions, the old system of extensive farming with poor business methods or none at all must fall and the farmer of today is already compelled to put a not inconsiderable amount of headwork into his affairs.

In spite of the fact, that to nothing is the human mind more resistant than to new ideas, a change in the business of farming is well under way and this change is for the better. It will bring greater prosperity, a more healthy independence and a higher and more just civilzation, the latter always having a material foundation.

The Loss Problem a Factor

One of the first evidences of this step on the road of progress is the increasing number of animals now to be found on our farms. We are commencing to correlate animal husbandry and crop growing, slowly learning that in successful farming the two must go hand in hand.

To many this change brings new problems. Some have had adequate experience with livestock, others have not, while it must not be forgotten that the handling of livestock requires more exacting care, when we are dealing with the more profitable but also more delicate improved breeds of today in the place of the long-horned steer, razor-back hog, or broncho of our fathers.

In the business of successful animal husbandry, the loss problem, referred to above is continually making its presence known, seriously demanding attention. Its solution requires a rich fund of information of such a variety of factors, as proper feeding, markets and marketing, suitable selection of animals and types, maintenance and care.

Foremost among the loss factors we recognize injury and disease, and their prevention rests to a very large extent with the farmer himself. Not only is he the one upon whom the animals, whatever they be, depend for proper care, but in the face of disease he is the one who should recognize its existence at a time when it is still possible to cut it short or to prevent further losses.

Takes Close and Careful Study

In order to acquit himself of this task, which after all he owes to himself more than anybody else, he must be willing to familiarize himself with the subject of disease and above all be prepared to give careful attention to many details in connection with his stock.

It is far from us to demand of the animal husbandryman, that he qualify as an expert in animal diseases, but he should set himself to acquire at least a working knowledge of the principles underlying animal sanitation and disease prevention. It may be a difficult thing for us to learn that in dealing with disease our greatest achievements rest on prevention and not on care. Intelligent disease prevention is a comparatively recent acquisition and it certainly is this when we contemplate the fact, that people have for ages looked for cure as the only salvation from the evils of disease. The passion for cure is bred into us so deeply that often we cannot think of anything else. Not that we in the least deprecate the splendid advance made in the cure of many diseases, but we must recognize the fact that this is more the field of the trained expert, while disease prevention is something in which nearly everybody can achieve something or can render efficient aid.

It deeply concerns the ones who depend upon the rearing of animals for a living or profit and their business equipment should contain a cetain amount of knowledge of the underlying facts of disease and the principles of prevention.

A certain part of the reading during the long winter evenings may well be devoted to this subject. There is no lack of literature on this topic and its perusal would mean infinitely more than the stuff that so many of us are apt to absorb. To inform ourselves on the questions of the day is a duty of any intelligent citizen, which should not be neglected. This can be done, however, without restricting ourselves to this alone, or without forgetting that there are so many subjects of a more immediate interest to our own well-being and success. To learn how to keep our herds free from tuberculosis, how to handle an outbreak of hog cholera, how to meet the advance of contagious abortion is certainly far to be preferred to the contributions to confusion dished up by third-rate politicians, exploiters and space writers.

The efficiency of the individual in his own field is after all the best guarantee of general welfare, and the stockmen are especially confronted with many problems demanding knowledge and attention to detail for their solution.

Farmers Should Inform Themselves

Returning to the diseases just mentioned as an example, the stockman has it in his power to have or not have tuberculosis in his herd. He is the one to take the initiative in its eradication from a herd already infected, he is the one upon whose vigilance depends whether or not it shall be introduced into a clean herd.

In hog cholera, it is the farmer again who is the first to discover the existence of the disease and even if he may not be familiar with it, it is up to him to take the initial steps towards its recognition and the prevention of further spread. If he has read about the disease or has had previous experience with it, he will know that sickness or deaths in a herd of hogs must never be passed up without a definite attempt to discover the actual causes, whether it pertains to suckling pigs in the spring or well developed marketable porkers during the fall. If informed he will also know where to turn for help and will not permit the first patent medicine vendor or would-be expert to cause him to do the wrong thing.

If even but slightly informed on the subject of infectious abortion, he will suspect something more serious than a mere accident, when his cows at apparently odd times, "slink" their calves. It is he who will look into the cause of it because he will be forewarned. And he will know that neglect may mean unprofitable business if not financial ruin. He will also know that he must bestir himself with preventive measures and not wait until his herd is affected throughout.

The diseases mentioned are only a few among the many which continually threaten our success in animal husbandry. The animal husbrandryman should know about them and be continually on the alert. He may learn his lesson by bitter experience and he may do so by gathering a little information beforehand. The latter method certainly is the least expensive, but it will require a certain amount of effort. This effort, however, will put money in his purse.

Little Things Require Attention

But not only does stock-raising for profit require study and information, it requires constant attention to details. In no instance is this more apparent than in the care of brood animals. There was perhaps a time once, when such care was not very imperative, but with the gradual improvement of our breeds of livestock, much of this has been changed. By means of skillful selection in breeding, certain especially desirable qualities have been developed, but this has often been accomplished at the expense of body vigor or by the sacrifice of certain protective qualities. Compare for instance the udder of our most highly improved dairy breeds with that of the cattle in the wild or semi-wild-state. In the latter the organ is just sufficient for the purpose intended by nature. It will nourish a calf only for so long as it is absolutely necessary. It is small and almost completely concealed within the space bounded by the thighs. There it is protected against injury and its functional activity is moderate and does not constitute anything resembling a strain. In the former on the other hand, the udder will furnish nutrition to many more than the normal offspring and will do so long after the calf is in its natural state has be weaned. It has developed enormo proportions, has exceeded the limi of its protective space. Hence it h become exposed to a great variety injuries; other animals may readi step on it, fence wires or thorns brambles can easily sratch it, etc. I secretory function is manifold that its prototype and its natural resis ance to infection has been large sacrificed. It is the udder that read ly "cakes," the one peculiarly predi posed to "garget" and other disease and when the dairyman complai that it is always the best udder th goes wrong, he is usually telling mo truth than poetry.

Something similar is seen in co nection with the birth function. An mals close to the state of natur rarely have trouble when they gi birth to their young, while in our i proved breeds difficulty is very fr quently met with. Even frequent enough to compel us to reckon with and this we must do, if we are not be occasionally confronted with gra losses arising from this source.

Good Animals Demand Good Care

As long as we maintain animals inferior breeding, we may be incline rightly or wrongly to leave everythi to nature, but when we are engag in raising our more profitable, high bred and expensive animals, we ca not afford to do so any longer. T valuable mare or cow about to gi birth must be an object of our co cern. We must be on hand in ord to see to it that everything takes pla normally and while actual assistan is not often necessary, we must present to render it, if things do n progress according to program.

The amount of loss sustained neglect of such animals is quite co siderable and at least some of o breeders may well follow the examp of their colleagues of the old wor who would not think of permitting valuable dam to approach the bir period without more or less consta observation.

When engaged in raising stock, w must be reconciled to supervise th parturition of our mares and cows an even with our ewes and sows we ma be able to prevent losses by rende ing timely assistance, when the tim for doing so arrives.

This is merely one of the many d tails which demand the attention the animal husbandryman. There a many others just as important. The all make for the prevention of losse for the stopping up of many holes, b and small, through which the profit are apt to slip away. Strict and co sistent attention to them is merel sound business, no more and no les —Dr. L. Vants, North Dakota Agricul tural College.

For Greatest Satisfaction Use

DOUBLE SERVICE Automobile Tires

Guaranteed 7,000 Miles Service

Absolutely Punctureproof

Double Service Tires are made double the thickness of the best standard make tires.

This 100% greater wearing surface naturally gives that much more mileage and service. The average of 12 miles of tough fabric and one inch surface tread rubber makes these tires *absolutely punctureproof.*

These tires excel all others for use in the country over rough and rugged roads as well as on hard pavements. They are as easy riding and resilient as any other pneumatic tire—the air space and pressure being the same.

They are the *most economical* and "care free" tires made and are used where tires must be depended on and tire troubles cannot be tolerated. Many *Double Service* style tires are in use in the U. S. government and European War service.

Our output is limited to a certain amount, but for a short time we offer the following reduced special prices as an Introductory Offer:

PRICES

	Tires	Tubes		Tires	Tubes
30x3 in.	$ 8.60	$2.30	36x4 in.	$17.45	$4.65
30x3½ in.	10.85	3.10	35x4½ in.	21.20	5.60
32x3½ in.	12.75	3.20	36x4½ in.	22.50	5.75
33x4 in.	15.75	4.20	37x4½ in.	23.60	6.20
34x4 in.	16.70	4.35	37x5 in.	26.30	6.60

All other sizes not included in above list also furnished. Non-skids at 10% additional.

Terms: Payment with order at above special prices, a 10% discount allowed on orders for two or more tires. All personal checks must be certified.

Try these tires now and be convinced of their very high qualities. Sold direct to the consumer only.

Descriptive folder upon request. Write for it.

This Church is Breeding Shorthorns

A country church near Ravenwood in northwest Missouri, is the cente of a community devoted to breedin Shorthorns. In the past three month the twenty-six members of the organ ization—and to be eligible to mem bership in this special effort, one i required to live within five miles o the church—have acquired one hun dred registered Shorthorns and tw hundred high-grade cows. Twelve reg istered bulls have been placed in serv ice. the latter, however, are owne privately by this group of individual within the circle. The matter of con venience determined this item.

The community is known as "Har-

mony". The Shorthorn Circle is but one of various interests which the community is encouraging and it is a logical plan for the improvement of the cattle stock in the community. By this method prospective buyers are more readily attracted because they have larger numbers of one breed from which to make selections. The advertising and other expenses can be held to the minimum and at the same time the best of results assured.

In too many communities do we find the stock representing a half dozen or more different breeds, the result being that co-operation is almost eliminated; that the individual breeders must find their own markets and with only a few salable stock, they are at a disadvantage as regards attracting buyers.

There is now a growing inclination to adopt one breed in a community and adhere to that breed and the results are gratifying.

Frank D. Thompson,
Lincoln, Nebr.

OPPORTUNITY IN LIVE STOCK FARMING

It is becoming a generally recognized fact that livestock is the basis of all permanent agriculture and the safest means of maintaing soil fertility. There are regions in which agriculture thrives for a time without livestock forming a part of the business of the farm. While it is possible to keep up the fertility of the soil for a time by the use of commercial fertilizers and cover crops alone, it is not a permanent method of agriculture. This is due to the expense or cash outlay which is involved and which necessitates the selling of all crops from the farm, which is a poor practice. Where the system of farming calls for a large cash outlay, as is the case in the purchase of a large amount of commercial fertilizer, the tendency is to lessen the amount used and consequently the soil is gradually depleted in fertility. Such sections cannot compete with livestock centers in the maintenance of the fertility of the soil and the returns from the farms. The investigations conducted by experts in many sections of the United States show that the labor income from all livestock farms is considerably higher than from farms upon which livestock represents but a small per cent of the capital invested. In other words, too many of the farms of the country are under-capitalized in the amount of livestock carried.

Livestock farming also provides a market for farm crops which in many instances are waste or cannot be sold to advantage owing to the fact that they may be damaged or are unsalable. Nearly every farm produces a large amount of feed of a bulky nature and there is no channel through which such feed can be marketed to better advantage than some form of livestock.

There is seldom an over-production of livestock and livestock products, which has a tendency to create a healthier market for such products. Livestock markets are usually more staple than those of most farm produce, largely due to the constant demand and because of being of a nonperishable nature. It is true that market conditions are frequently unsatisfactory, but when such is the case it is possible to hold the livestock until such time when the market has improved.

During the last decade the population of the United States has increased more rapidly than the amount of livestock produced so that during the past few years an actual shortage has existed. While this shortage has been overcome to some extent, the country does not have its normal supply at the present time. Export trade in meat has again been established and no doubt will be continued, owing to the fact that the European countries will be less able, after the war, to produce their own supply of meat than before the present war.

In the development of our system of agriculture we have followed the path of least resistance, with the result that only the more fertile and easily tilled lands have been made use of. There are large areas of land in every section of the United States that are rough, hilly and untillable, which must be utilized in economic agriculture. There is no type of farming to which such lands can be used to better advantage than livestock. Many of these regions are at some distance from railroads and markets. When the crops produced in such sections are fed to livestock the expense of marketing has been solved, as the livestock can be driven to the market.

The production of livestock on an economic and sound basis is essential in most communities for the carrying on and the development of a successful agriculture. Especially trained men will be in demand to aid in building up and reclaiming areas and reshaping the system of agriculture that will be followed in many sections of the country. This offers one of the largest fields of work in the future for properly trained men along these lines.

One of the most fertile fields for the future in Animal Husbandry, lies in the breeding of purebred livestock. Farmers are beginning to realize the importance of breeding a better class of animals upon their farms. Many of these farmers, however, are not in a position to follow the production of pure-bred animals, consequently, they will be the buyers of the surplus animals produced by the breeder of pure-bred stock. The demand from the farmers for good sires will be much greater in the future than it has been in the past. The general demand for improved livestock will have a tendency to keep the price of such animals at a figure which will make the breeding of pure-bred animals a profitable undertaking.

The bulk of the market animals will always be produced by men who are not engaged in the breeding of pure-bred animals. Such producers realize the importance of the use of good blood, even though the breeding females may be grades. With the prevailing price of market animals there is an unusual opportunity to produce the type which the market demands.

In order to be successful as a producer of pure-bred stock or market animals it is highly important that all phases of the subject be thoroughly understood. The person must not only be a close student of breeding, but must follow closely the breeding side of the work. Community centers can be developed for the breeding of pure-bred livestock which may become the means of universal improvement in the livestock of a community. No one is better fitted for such leadership than a man who has had a thorough training in the fundamentals of the livestock business.

The economical feeding of livestock is of importance. Conditions have changed during the last decade with the constant increase in the price of grains and farm feeds. The utilization of cheap feed in the growing of young stock and the maintenance of breeding animals, must be fully appreciated. Fattening rations have changed so that the use of expensive grains has been eliminated to keep down the cost of production.

With the general increase in livestock production there will be a growing demand for managers of livestock farms. To be fully qualified for such work will require the same general knowledge of the problems of breeding and feeding as are required for any practical phase of this work. The establishment of a pure-bred herd requires a considerable amount of capital. There are, however, many owners of tracts of land who are willing to invest capital in the establishment of such plants if they can secure competent managers for their business.

While the establishment of pure-bred herds, the production of market animals, and the management of livestock farms seem to provide the largest fields and greatest opportunities in Animal Husbandry, the educational and research phase must not be overlooked.

With this generally increased interest in livestock production it will be necessary to conduct demonstrations in various phases of livestock. Agricultural instructors in the vocational schools and county agriculturists must have a thorough training in matters pertaining to livestock, as they will find the big problems of the people to be those of livestock breeding and management. The United States Department of Agriculture is rapidly extending its line of work and will demand a number of thoroughly well-trained men each year. No line of work offers a greater opportunity than that of Animal Husbandry research. New problems relating to breeding, feeding and nutrition are constantly to be solved, which will require a large number of competent men.

W. H. Tomhave,
Pennsylvania State College.

Own An IHC Binder

KNOWING the conditions in your harvest fields as well as you do, it will be an easy matter for you to pick out the right grain binder for your work. Note the details of construction—How is the main frame built? Is the main wheel large enough and wide enough to give plenty of traction? Is there a simple means provided for quickly and easily taking the strain off the canvas at night, or when the binder is out of use? Are ball and roller bearings provided to lighten the draft? Will the elevator take care of both light and heavy stands of grain? Is the knotter simple and sure in action? These are the things that count.

In the **I H C** binders—**Champion, Deering, McCormick, Milwaukee, Osborne** and **Plano**—these things and all other details are taken care of. Own an I H C binder.

The same arguments hold good for the twine you use. Ask for and insist upon getting an I H C twine, made to work in the binder you buy, and sold at the lowest price consistent with I H C quality.

Your local dealer can furnish you with I H C binders, repairs and twine. See him or write to us for complete information.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VIII May 15, 1916 No. 10

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the potoffice at Columbia, Missouri, as second-class mail matter.

ADVERTISING FARM PRODUCTS

It is said the man who is the farthest from market is the one who has nothing to sell but the fellow who has something to sell and does not know how or where to find a buyer must live in the same neighborhood. The last forty years have shown wonderful progress in advertising and great fortunes have been made by men who understood the game.

We think about the last man to avail himself of the opportunity for making money by advertising is the farmer but he too is coming to learn its advantages. We have known farmers who had a horse or a cow to sell who would put a price on the animal then wait weeks or months for a buyer when if they had spent not more than twenty-five or fifty cents with the local paper they would have found a buyer and saved several dollars in feed bills. There are many articles farmers have for sale from time to time that can be sold more quickly and possibly for a better price by advertising but where this kind of publicity will pay best is where the farmer is producing a superior article.

People who have money to buy what they want are usually willing to pay a premium for quality and the best way we know of to find these people is to let them know what you have to sell through some publication they are likely to read. But the man who builds up a good trade in advertising must produce an article with superior quality. This is one of the benefits most men will get by systematic advertising, they will find it will stimulate them to produce a good article and to improve on it and as their reputation spreads their profits will grow and they will use all their skill to produce the best.

The man who decides to try advertising as a means to more profitable farming should select a name for his farm, which as a matter of course should in some way incorporate his own name and then make that name a guarantee for quality and honest dealing.

It was not our aim in suggesting the above title to discuss the details of advertising but merely to get farmers to thinking about the question of first trying to produce something of good quality, whether it be, fruit, butter, poultry or live stock, it matters not and then through advertising find the man who is willing to pay a fair price for it.

COMMUNITY BREEDING

We have frequently discussed in The Missouri Farmer the value it would be to any community if all the farmers, or at least many of them, would form a community breeding club and would produce only one breed of horses, cattle, sheep, hogs or poultry. The following letter just received from a reader in Morgan County suggested this article:

"As Secretary of the Versailles Farmers' Club I am writing you for any information or assistance that will save us money or help us in any way.

"We perfected a permanent organization in March. We meet in the court house the last Saturday in each month, 2 p. m. At our April meeting we carried out a program previously arranged which consisted of talks on various farm topics by farmers and townsmen. It was suggested and discussed that the club members who are cattle feeders and breeders select one breed of beef cattle and grade up their herds by buying pure bred sires and gradually work into the pure bred business. No certain breed was agreed upon and so we did not accomplish much. We have enthusiastic farmers at our meetings and good attendance but we must accomplish some undertaking if we expect to hold the interest. "We are in our infancy as a club and will appreciate any suggestions you may give us."

L. E. D., Versailles.

The better farming and better marketing program our Morgan County friends have started in to develop is along the lines The Missouri Farmer has been advocating for a long time and there is abundance of work to do that ought to hold the farmers together permanently. We have in mind one neighborhood that has been organized for about six years and the interest is as good now as it was at the start but their sole work has been better farming and better social conditions. They have so far attempted nothing in the way of better marketing. We mention this merely to suggest to our inquirer that there is no need to get discouraged because the members of any farm club do not take up any new proposition on the first suggestion. The matter of community breeding clubs is one of great benefit to the members if they can get together and hold together for a few years. The first few years are the difficult ones because the benefits are greater and greater as the club grows in members, in number of animals produced and in reputation.

It is not necessary to get all the farmers into such a club to make it go at the start for if only three or four men will cooperate their success will gradually bring others to see the advantages and cause them to join.

The first advantage in a breeding club is that it enables the members to get a better sire than individuals can afford to buy. If but four men who own thirty or forty cows all told will join hands they can buy a high class bull that will cost each man no more or possibly less than if he should buy only a grade or an inferior pure bred animal. It is an advantage, of course, to have two or three clubs so that bulls may be exchanged after a year or two of service.

It is a very simple matter where such clubs are formed to lay the foundation for pure bred herds. The sire should without question be a pure bred animal wherever possible and always where the aim is pure bred herds. But where the members of the club have limited capital if each one will buy only one pure bred cow or heifer it will take but a few years to grow into the pure bred business and do it without any great outlay of money. And all the time the grade herd is being improved and made more profitable than where the usual methods are followed.

Another advantage the club member has over the individual breeder is in the better opportunity for selling when he has a surplus. The club can advertise all the stock belonging to its members as cheaply as one could advertise a smaller number. Again where there are several animals to select from it is more attractive to buyers.

The question our correspondent raises of agreeing on the breed is an important one though not an insurmountable difficulty. The success of the club will not depend, as we have already stated of getting every breeder in the neighborhood to join but will depend only upon the intelligence and cooperation of a few men. There is so little difference in the merits of the leading breeds of beef cattle that it ought not be a hard proposition to get a few men together on a breed and particularly is this true where there are no pure bred herds already established. Men certainly can not and will not stand in their own way of success because of a personal preference in choosing between a Shorthorn, Hereford, Angus or Galloway. Men are succeeding with all of these breeds and it is largely a matter of personal fancy as to which is the best. If a good herd or two of any breed is already established why not start with that breed? If herds are already in existence of two breeds it will not be fatal to success to start two clubs because of the rivalry that may stimulate greater effort although we do not want to be understood as advocating more than one breed where it is possible for the farmers to agree.

One of the important things is to establish a reputation for high class stock and when that is done the benefits will be so apparent that no one will want to breed any other class of animals. Remember "great oaks from little acorns grow" and we think it is quite possible to start a club with a very few members that will in a few years grow into a community and perhaps a county-wide cooperative enterprise.

WHERE DO YOU STAND?

The St. Joseph Stock Yards Journal says the highest price paid on that market for hogs within a period of more than five years was paid last Saturday, May 13, when one load sold for $9.87½ a hundred. We would ask our readers to compare the prices farmers are now getting for their fat hogs with the prices they were getting last October and November. Can you figure out any legitimate reason why the packers should be permitted to hammer the very life out of prices in the fall and early winter when the bulk of hogs are going to market and then put them up in the spring when they want to sell their products?

Do our readers not think that the fight The Missouri Farmer started months ago is beginning to bear fruit? This agitation has now reached Congress and it is said by those in a position to know that the big packers are beginning to get pretty nervous over the situation. We hope Congress will go ahead with this investigation and find out just what is the matter and in some way make it impossible for any combination of men to arbitrarily fix the price of any food product. If Congress does this, however, it will be because the great majority of farmers demand it. Every farmer should throw the weight of his influence into the fight and keep a close watch on his Congressman and Senators.

We have few farmers or live stock men in Congress and the average Congressman knows very little about farmers' profits and losses and the only way to get them interested is to let them know that farmers are not getting a square deal and that they are demanding action by Congress.

But to get back to the question, "Where do you stand?" we want to make this personal to every reader of this paper. No farmer who sells hogs, cattle, sheep, butter, eggs or wool has any valid excuse for staying out of this fight. One farmer acting alone can do little, but if the whole body of more than six million farmers in the United States will act together, they can get just about what they want, that is within the bounds of reason. There are plenty of other troubles besides the fight against the packers for farmers to remedy and it will take the help of all to right them. This work must begin at home, first, with each individual farmer and then the school district, the county, the state, and finally the nation. The sooner every individual takes it upon himself to do all he can, to cooperate with his neighbors without prejudice the sooner we will get relief. This is an appeal to each and every farmer who reads this paper to go to work and organize a farm club in his neighborhood if not already organized and be ready to join the state-wide organization that is now in the process of organization.

LOOK OUT FOR FAKIRS

There is abundance of evidence every year that Barnum was right when he said "people like to be humbugged" or at any rate there are a lot of people always ready to bite at fakirs schemes. The United States Department of Agriculture has just issued a warning to farmers about buying the "miraculous" wheats that are offered for sale most every year. The department has investigated the merits of most all these wheats and does not find that they possess superior merit. These wheats have been sold at fabulous prices and are sold under the different names, "Jerusalem," "Alaska," "Mummy," "Egyptian," and "Miracle," but whatever the name farmers who want to protect themselves against fraud will do well when considering the purchase of seed wheat away from home to buy only of a reputable seedsman or from some one who can furnish a good reference. As to the merits of new varieties that information can usually be obtained by writing the Experiment Station.

Land Bank Wins First Step

The first step toward a rural credit scheme for Missouri has been won. The committee in charge of the circulation of petitions for the Gardner Land Bank announces that forty-one thousand and five hundred voters have signed the petitions asking that the land bank proposition be submitted to the voters for their approval at the November election.

If the proposition carries a majority vote Missouri will be the first state to adopt a real rural credit system under the control of the State. The Missouri Farmer takes a great deal of pride in the success of the movement for it was the first agricultural paper in the state to advocate a land bank and from the start has endorsed and promoted the plan embodied in the Gardner Land Bank Act.

BARNYARD GOSSIP

A few days ago I heard two town residents comparing notes on their experience—buying nursery stock. The first one was telling what a fine lot of shrubbery he had bought from an agent and among other things was a "weeping mulberry" 4 feet high for which he had paid $1.50. "Why," said the second man, I sent an order direct to a nursery and among the plants I bought was a "weeping mulberry" fully as large as yours is and it cost me just 65 cents." On comparing prices it was found that the man who had bought from the agent had paid about twice as much as the man who had bought direct from the nursery and both had bought the same grade of stock. And this was about the difference: Along in January when farmers are not very busy one of these men wrote to three or four reliable nurseries for their catalogs and prices and at his leisure he made out a list of what he needed, sent the order in and was treated just as well as any agent could have treated him and saved about one-half of the bill. Now, although many of them can not be trusted but just like a great many other things we do, it is the system that is wrong. Any reliable nurseryman will list his stock by grades and at the expense of a postal card you can get a catalog and send in your order at a cost of two cents for a stamp. When we buy from the agent we pay his salary and expenses on top of the nursery price. The above example merely illustrates the need for a more direct and simple plan for buying and selling in order that the farmer may have his rightful share of the dollar.

We have just read a news item from Jefferson City stating that the state game warden has found out by costly experiment that the English pheasant and Hungarian partridge are not suited to the environment found in Missouri. A state game farm was established near Jefferson City and thousands of pheasants and partridges were hatched and distributed throughout the state but after five years effort very few of these birds are to be found. Then an effort was made to propagate the common quail (Bob White) but that too, proved a failure. It is a well known fact that it is very difficult to raise the common quail in close confinement. There is just one way we can make Missouri a great game preserve and that is to depopulate the state, tear down our towns and cities, stop the frequency of the automobile and the railroad train, let our fields grow up to weeds and bushes, turn civilization back a hundred years or more and then we can have the wild turkey, the pheasant, the deer and the bear just like Daniel Boone found them when he was fighting Indians around the Boonslick country.

But after all—the grafters to the contrary notwithstanding—is not Missouri doing a greater service and being put to very much greater use for both man and God now in A. D. 1916, than it was in 1716? Nature unaided by man stocked our forests with buffalo and bear but Nature aided by man has replaced these wild animals by the far more beautiful and useful. Shorthorn, Angus, Hereford, Galloway and other improved breeds of cattle. If we would have an environment in which the bear and buffalo would thrive we must destroy the work of more than a hundred years of civilization and progress. Is not the Brown Leghorn chicken just as beautiful a bird and many times more useful than the pheasant? If you want to see beautiful things look about you and you will find them a plenty.

"SENSE AND NONSENSE"

If this job is perpetrated on you folks again, nobody will be to blame but Hirth. He has asked me to commit it and I have had much misgiving about it, as well as dire forebodings.

The trouble is, you see, that it takes a lot of sense to write nonsense, and I am desperately short on the first named commodity. Most any one no matter how little he knows can once in a while write sense, and talk it some times, but it takes a real artist to do a fancy job in either writing or talking nonsense. It is a very dangerous past time too, sometimes it results in genuine humor, but more often the only result is the laugh the other fellow gets at seeing a writer or speaker make a fool of himself.

If I could write, speak, or act such nonsense as would create genuine mirth and jolly laughter I might get a lot better wage at that than I do at the job I hold, trying to talk and act sense as well as my limited capacity will permit. The average human persons either he ones or she ones are not hunting sense very vigorously. Excitement and nonsense are the commodities chased most.

In an audience made up of the common herd let one man talk the most profound philosophy and many of his hearers will snore on him, but let two painted fools take the platform and every body takes notice, and they can quote the fool when not a syllable of the "sense" could be recalled.

It is doubtful if the majority are able to detect really high class humor from low grade stuff. It might be unfair to draw such a conclusion, but we judge from the "signs of the times." A certain Charlie boy with big shoes, and a little mustache, a cane and a cocked hat, gets the most "dough" for dispensing his nonsense to us "braves." I may be no "just judge" but it seems to me that the humor of this Charlie chap is of a very low grade, but somehow the folks seem to like it, Charlie knows they like it, and they pay the good price to get it. So, I say, go to it, Old Boy, its good business., "Give 'em" what they will pay for whether they need it or not. The devil is doing the same.

I am a timid soul, and it has taken much effort of my bean, and anguish of—lend me a word, please,—to go to the boneyard and exhume old sense and nonsense, clean him up, renovate him and put a little fat on him and make him ready to work, and the worst may yet be to come and if it comes, I am right here going to say that I will not be responsible for what may happen.—Sam Jordan.

WHERE SHALL WE GO FOR GUIDANCE

The marketing of cattle or any other live stock, while not a strictly technical subject dealing with animal husbandry, is of primary importance to the student interested in the practical production of live stock, because a knowledge of the "ins" and "outs" of marketing is essential to large profits for the farmer. H. W. Mumford, in Circular 163, of the Illinois Station, "Economic Factors in Cattle Feeding," says, "A knowledge of market conditions and the factors which affect them is essential to a thorough understanding of cattle feeding." A man may be able to handle the raising and feeding of cattle, as well as the best, yet, if he does not know the markets, he will not be able to do much better than the man who is only a mediocre herdsman but who is a good salesman.

As a rule, men learn what they know of markets and marketing through hard knocks in the school of experience. With students, however, many of the things about marketing could be so studied that they would at least have an idea concerning the workings of markets and would not be entirely ignorant of this phase of the live stock trade. There is a vast amount of material dealing with the productive side of the business, but as yet little has been done to guide the beginner or amateur in the way of "going up against" the middleman and packer. Much has been written on the marketing of fruits, vegetables, and farm produce other than live stock. Probably the cause for this has been due to some sort of a check placed upon the agricultural experiment stations that has hindered them from turning to this field of the live stock industry.

The present Secretary of Agriculture, Hon. David F. Houston, stated, at the beginning of his term, that the Office of Markets, of the United States Department of Agriculture, would give special attention to the study of the live stock markets, so as to benefit the farmer in his struggle with the middleman. So far very little has been done. This inactivity leads one to believe that there is a reaosn. What is the reason? Some people and the radical agricultural press, if such a thing exists, lay the blame at the door of the packer. Just how true these assertions are is a question that can not readily be answered. However, the fact remains that so far very little has been done by the so-called "Government Experts" on the live stock situation, and it is time that the students are taught something concerning the marketing of live stock and the factors influencing current prices.—D. C.

No More Free Seeds

After this date the free seed offer of Sudan Grass and Feterita with 3 year's subscription will be withdrawn. We thank those who responded to this offer but from this date the offer is withdrawn.

WE WILL PAY YOU $120.00 to distribute "Successful Farming" in your locality. Money making book for farmers. Write at once for our new Institute plan. 60 days' work or less. No money required.
INTERNATIONAL INSTITUTE,
431 Winston Bldg., - Philadelphia

SILO SERVICE

That is what you want in that silo you are going to build—**Silo Service.**

Therefore, keep these facts in mind:

Of all the silos in America today, an overwhelming majority are built of **Wood,** because practical farm experience has proved that silos of wood make and keep silage best, cost least, are easiest to erect, and are fully as durable as any other substantial farm building.

And just as the great majority of all silos are built of wood, so are the great majority of wood silos built of

Southern Yellow Pine

"The Wood of Service"

That is because the great strength, even grain, moderate cost, and resistance to decay make Southern Yellow Pine the best wood for silos.

If you want to get the **Farmers'** side of silo service, told by practical farmers themselves, send for the best and most informative Silo Book printed—"How To Choose and How To Use a Silo." It is full of valuable **facts,** and it is **FREE.** Please fill out the coupon with pencil.

David Dunne

A Romance of the Middle West

By BELLE KANARIS MANIATES

CHAPTEA VII

"Whar wuz you, Dave, all the time we wuz in town?" asked Barnabas, as they drove homeward.

"In Judge Thorne's office."

"Judge Thorne's office! What fer?"

"He asked me there, Uncle Barnabas. He was my father's lawyer once, you know."

"So he wuz. I hed fergot."

"He warned me against my temper, as you did, and he told me—all about my father."

"I am glad he did, Dave. He wuz the one to tell you."

"He says that every time I come to Lafferton I must come up and report to him."

"Wal, Dave, it does beat all how folks take to you. Thar wuz Joe wanted you, and now Mart Thorne's interested. Mebby they could do better by you than we could. Joe's rich, and the Jedge is well fixed and almighty smart."

"No," replied David stoutly. "I'd rather stay with you, Uncle Barnabas. There's something you've got much more of than they have."

"What's that, Dave?" asked Barnabas curiously.

"Horse sense."

Barnabas looked pleased.

"Wal, Dave, I callate to do my best fer you, and thar's one thing I want you to git some horse sense about right off."

"All right, Uncle Barnabas. What is it?"

"Feedin' on them fairy stories all day. They hain't hullsome diet fer a boy."

"The Judge reads them," protested David. "He has the same book of fairy stories that Joe gave me."

"When you've done all the Jedge has, and git to whar you kin afford to be idle, you kin read any stuff you want ter."

"Can't I read them at all?" asked David in alarm.

"Of course you kin. I meant, I did n't want you stickin' to 'em like a pup to a root. You're goin' down to the fields to begin work with me this afternoon, and you won't feel much like readin' to-night. I wuz lookin' over them books of your'n last night. Thar's one you'd best start in on right away, and give the fairies a rest."

"Which one?"

"Life of Lincoln. That'll show you what work will do."

"I'll read it aloud to you, Uncle Barnabas."

When they reached the bridge that spanned the river Old Hundred dropped the little hurrying gait which he assumed in town, and settled down to his normal, comfortable, country jog.

"Uncle Barnabas," said David thoughtfully, "what is your religion?"

Barnabas meditated.

"Wal, Dave, I don't know as I hev what you might call religion exackly. I b'lieve in payin' a hundred cents on the dollar, and a-helpin' the man that's down, and—wal, I s'pose I come as nigh bein' a Unitarian as anything."

The distribution of the purchases now began. Sometimes the good housewife, herself, came out to receive the parcels and to hear the latest news from town. Oftener, the children of the household were the messengers, for Barnabas' pockets were always well filled with candy on town days. At one place Barnabas stopped at a barn by the roadside and surreptitiously deposited a suspicious looking package. When he was in front of the next farmhouse a man came out with anxious mien.

"All right, Fred!" hailed Barnabas with a knowing wink. "I wuz afeerd you'd not be on the watchout. I left it in the manger.

They did not reach the farm until the dinner hour, and the conversation was maintained by M'ri and Barnabas on marketing matters. David spent the afternoon in being initiated in field work. At supper, M'ri asked him suddenly:

"To whom did you give the flowers, David?"

"I've made a story of it, Aunt M'ri, and I'm going to tell it to Janey. Then you can hear."

M'ri smiled, and questioned him no further.

When the day was done and the "still hour" had come, Janey and David, hand in hand, came around the house and sat down at her feet. It was seldom that any one intruded at this hour, but she knew that David had come to tell his story.

"Begin, Davey," urged Janey impatiently.

"One day, when a boy was going to town, his aunt gave him a big bouquet of pink roses. She told him to give them to some one who looked as if they needed flowers. So when the boy got to town he walked up Main Street and looked at every one he met. He hoped to see a little sick child or a tired woman who had no flowers of her own; but every one seemed to be in a hurry, and very few stopped to look at flowers or anything else. Those that did look turned away as if they did not see them , and some seemed to be thinking, "What beautiful flowers!' and then forgot them.

"At last he met a tall, stern man dressed in fine clothes. He looked very proud, but as if he were tired of everything. When he saw the flowers he didn't turn away, but kept his eyes on them as if they made him sad and lonesome in thinking of good times that were over. So the boy asked him if he would not like the flowers. The man looked surprised and asked the bay what his name was. When he heard it, he remembered that he had been the attorney for the boy's father. He took him up into an office marked private, and he gave the boy some good advice, and talked to him about his mother, which made the boy feel bad. But the man comforted him and told him that every time he came to town he was to report to him."

M'ri had sat motionless during the recital of this story. At its close she did not speak.

"That wasn't much of a story. Let's go play," suggested Janey, relieving the tension.

They were off like a flash. David heard his name faintly called. M'ri's voice sounded far off, and as if there were tears in it, but he lacked the courage to return.

CHAPTER VIII

Two important events calendared the next week. The school year ended and Pennyroyal, the "hired help," who had been paying her annual visit to her sister, came back to the farm. There are two kinds of housekeepers, the "make-cleans" and the "keep-cleans." Pennyroyal was a graduate of both classes. Her ruling passions in life were scrubbing and "redding" up. On the day of her return, after making onslaught on house and porches, she attacked the pump, and planned a sand-scouring siege for the morrow on the barn. In appearance she was a true exponent of soap and water, and always had the look of being freshly laundered.

At first Pennyroyal looked with ill favor on the addition that had been made to the household in her absence but when David submitted to the shampooing of his tousled mass of hair, and offered no protest when she scrubbed his neck, she became reconsiled to his presence.

On a "town day" David, carrying a huge bunch of pinks, paid his second visit to the Judge.

"Did she tell you," asked the tall man, gazing very had at the landscape without the open window, "to give these flowers to some one who needed them?"

There was a perilous little pause. Then there flashed from the boy to the man a gaze of comprehension.

"She picked them for you," was the response, simply spoken.

The Judge carefully selected a blossom for his buttonhole, and then proceeded to draw David out. Under the skillful, schooled questioning, David grew communicative.

"She's always on the west porch after supper." He added naively; "That's the time when Uncle Barnabas smokes on the east porch, Jud goes off with the boys, and I play with Janey in the lane."

"Thank you, David," acknowledged the Judge gratefully. "You are quite a bureau of information, and," in a consciously casual tone, "will you take a note to your aunt? I think I will ride out to the farm to-night."

David's young heart fluttered, and he went back to the farm invested with a proud feeling of having assisted the fates. The air was filled with mystery and an undercurrent of excitement that day. After David had delivered the auspicious note, a private conference behind closed doors had been held between M'ri and Barnabas in the "company parlor." David's shrewd young eyes noted the weakening of the lines of finality about M'ri's mouth when she emerged from the interview. Throughout the long afternoon she performed the usual tasks in nervous haste, the color coming and going in her delicately contoured face.

When she appeared at the supper table she was adorned in white, brightened by touches of blue at belt and collar. David's young eyes surveyed her appraisingly and approvingly, and later he effected a thorough effacing of the family. He obtained from Barnabas permission for Jud to go to town with the Gardner boys. His next diplomatic move was to persuade Pennyroyal to go with himself and Janey to Uncle Larimy's hermit home. When she wavered, he commented on the eclipse of Uncle Larimy's windows the last time he saw them. That turned the tide of Pennyroyal's resistance. Equipped with soft linen, a cake of strong soap, and a bottle of ammonia, she strode down the lane, accompanied by the children.

The walk proved a trying ordeal for Pennyroyal. She started out at her accustomed brisk gait, but David loitered and sauntered, Janey of course setting her pace by his. Pennyroyal, feeling it incumbent upon herself to keep watch of her young companions, retraced her steps so often that she covered the distance several times.

At Uncle Larimy's she found such a fertile field for her line of work that David was quite ready to return when she pronounced her labors finished. She was really tired, and quite willing to walk home slowly in the moonlight.

It was very quiet. Here and there a bird, startled from its hiding place sought refuge in the higher branches. A pensive quail piped an answer to the trilling call from the meadows. A tree toad uttered his lonely, guttural exclamation. The air, freshening with a coming covey of clouds, swayed the tops of the trees with mournful sound.

David full of dreams, let his fancy have full play, and he made a little story of his own about the meeting of the lovers. He pictured the Judge riding down the dust-white road as the sunset shadows grew long. He knew the exact spot—the last bit of woodland—from where Martin, across level-lying fields, could obtain his first glimpse of the old farmhouse and porch. His moving-picture conceit next placed M'ri, dressed in white, with touches of blue, on the west porch. He had decided that in the Long Ago Days she had been wont to wear blue, which he imagined to be the Judge's favorite color. Then he caused the unimpressionable Judge to tie his horse to the hitching post at the side of the road and walk between the hedges of sweet peas that bordered the path. Their pink and white sweetness was the trumpet call sounding over the grave of the love of his youth. (David had read such a passage in a book at Miss Rhody's and thought it very fine and applicable.) His active fancy took Martin Thorne around the house to the west porch. The white figure arose, and in the purple-misted twilight he saw the touches of blue, and his heart lighted.

"Marie!"

The old name, the name he had given her in his love-making days, came to his lips. (David couldn't make M'ri fit in with the settings of his story, so he re-christened her.) She came forward with outstretched hand and a gentle manner, but at the look in his eyes as he uttered the old name, with the caressing accent on the first syllable, she understood. A deep sunrise color flooded her face and neck.

"Martin!" she whispered as she came to him.

David threw back his head and shut his eyes in ecstatic bliss. He was rudely roused from his romantic weaving by the sound of Barnabas' chuckle as they came to the east porch.

"You must a washed every one of Larimy's windows!"

"Yes," replied Janey, "and she mopped his floors, washed and clean-papered the shelves, and washed and scrubbed the old gray horse."

"Pennyroyal," exclaimed Barnabas gravely, "I wonder you ain't water-logged!"

"Pennyroyal 'd rather be clean than be President," avered David.

"Where's M'ri?" demanded Pennyroyal, ignoring these thrusts.

"On the west porch, entertaining company," remarked Barnabas.

"Who?"

Pennyroyal never used a superfluous word. Joe Forbes said she talked like telegrams.

Barnabas removed his pipe from his mouth, and paused to give his words greater dramatic force.

"Mart Thorne!"

The effect was satisfactory.

Pennyroyal stood as if petrified for a moment. Than she expressed her feelings.

"Hallelujah!"

Her tone made the exclamation as impressive as a benediction.

M'ri visited the bedsides of each of her charges that night. Jud and Janey were in the land of dreams, but David was awake, expecting her coming. There was a new tenderness in her good-night kiss.

"Aunt M'ri," asked the boy, looking up with his deep, searching eyes and a suspicion of a smile about his lips, "did you and Judge Thorne talk over my education? He said that he was going to speak to you about it."

Her eyes sparkled.

"David, the Judge is coming to dinner Sunday. We will talk it over with you then."

"Aunt M'ri," a little note of wistfulness chasing the bantering look from his eyes, "you aren't going to leave us now?"

"Not for a year, David," she said, a soft flush coming to her face.

"He's waited seven," thought David, "so one more won't make so much difference. Anyway, we need a year to get used to it."

After all, David was only a boy. His flights of romantic fancy vanished in remembrance of the blissful certainty that there would be ice cream for dinner on Sunday next and on many Sundays thereafter.

CHAPTER IX

The little trickle of uneven days was broken one morning by a message which was brought by the "hired man from Randall's."

"We've got visitors from the city tew our house," he announced. "They want you to send Janey over tew play with their little gal."

Befitting the honor of the occasion, Janey was attired in her blue-sprigged muslin and allowed to wear the turquoises. David drove her to Maplewood, the pretentious home of the Randalls, intending to call for her later. When they came to the entrance of the grounds at the end of a long avenue of maples a very tiny girl, immaculate in white, with hair of gold and eyes darkly blue, came out from among the trees. She regarded David with deep, grave eyes as he stepped from the wagon to open the gate.

"You've come to play with me," she stated in a tone of assurance.

"I've brought Janey to play with you," he rejoined, indicating his little companion. "If you'll get in the wagon, I'll drive up to the house."

She held up her slender little arms to him, and David felt as if he were lifting a doll.

"My name is Carey Winthrop. What is yours?" she demanded of Janey as they rode up the shaded, graveled road.

"Janey Brumble," replied the visitor, gaining ease from the ingenuousness of the little girl and from the knowl-

edge that she was older than her hostess.

"And he's your brother?" indicating David.

"He's my adopted brother," said Janey; "he's David Dunne."

"I wish I had a 'dopted brother," sighed the little girl, eyeing David wistfully.

David drove up to the side entrance of the large, white-columned, porticed house, on the spacious veranda of which sat a fair-haired young woman with luminous eyes and smiling mouth. The smile deepend as she saw the curiously disfigured horse ambling up to the stone step.

"Whoa, Old Hundred!" commanded David, whereupon the smile became a rippling laugh. David got out, lifted the little girl to the ground very carefully, and gave a helping hand to the nimble, independent Janey.

"Mother," cried Carey delightedly, "this is Janey and her 'dopted brother David."

David touched his cap gravely in acknowledgment of the introduction. He had never heard his name pronounced as this little girl spoke it with the soft "a." It sounded very sweet to him.

"I'll drive back for you before sundown, Janey," said David, preparing to climb into the wagon.

"No," objected Carey, regarding him with apprehension, "I want you to stay and play with me. Tell him to stay, mother."

There was a regal carriage to the little head and an imperious note—the note of an only child—in her voice.

"Maybe David has other things to do than to play with little girls," said her mother, "but, David, if you can stay, I wish you would."

"I should like to stay," replied David earnestly, "but they expect me back, and Old Hundred is needed in the field."

"Luke can drive your horse back, and we will see that you and Janey ride home."

So Carey, with a hand to each of her new playmates, led them across the driveway to the rolling stretch of shaded lawn. The lady watched David as he submitted to be driven as a horse by the little girls and then consituted himself driver to his little team of ponies as he called them. Later, when they raced to the meadow, she saw him hold Janey back that Carey might win. Presently the lady was joined by her husband.

"Where is Carey?" he asked.

"She is having great sport with a pretty little girl and a guardian angel of a boy. Here they come!"

They were trooping across the lawn the little girls adorned with blossom wreaths which David had woven for them.

"May we go down to the woods—the big woods?" asked Carey.

"It's too far for you to walk, dear," remonstrated her mother.

"David says he will draw me in my little cart."

"Who is it that was afraid to go into the big woods, and thought it was a forest filled with wild beasts and scary things?" demanded Mr. Winthrop.

The earnest eyes fixed on his were not at all abashed.

"With him, with David," she said simply, "I would have no afraidments."

"Afraidments?" he repeated perplexedly, "I am not sure I understand."

"Don't tease, Arthur; it's a very good word," interposed Mrs. Winthrop quickly. "It seems to have a different meaning from fear."

"Come up here, David," bade Mr. Winthrop, "and let me see what there is in you to inspire one with no 'afraidments'."

The boy came up on the steps, and did not falter under the keen but good-humored gaze.

"Do you like to play with little girls, David?"

"I like to play with these little girls," admitted David.

"And what do you like to do besides that?"

"I like to shoot."

"Oh, a hunter."

"No; I like to shoot at a mark."

"I like to read, and fish, and swim, and—"

"Eat ice cream!" finished Janey roguishly, showing her dimples.

The man caught her up in his arms.

"You are a darling, and I wish my little girl had such rosy cheeks. David can you show me where there is good fishing?"

"Uncle Larimy can show you the best places. He knows where the bass live, and how to coax them to bite."

"And will you take me to this wonderful person to-morrow?"

"Yes, sir."

Carey now came out of the hall with her cart, and David drew her across the lawn, Janey dancing by his side. Down through the meadows wound a wheel-tracked road leading to a patch of dense woods which, to a little girl with a big imagination, could easily become a wild forest infested with all sorts of nameless terrors—terrors that make one draw the bedclothes snugly over the head at night. She gave a little frightened cry as they came into the cool, olive depths.

"I am afraid, David. Take me!"

He lifted her to his shoulder, and her soft cheek nestled against his face.

"Now you are not afraid," he said persuasively.

"No; but I would be if you put me down."

They went farther into the oak depths, until they came to a fallen tree where they rested. Janey, investigating the forestry, finally discovered a bush with slender red twigs.

"Oh," she cried, "now David will show you what beautiful things he can make for us."

"I have no pins," demurred David.

"I have," triumphantly producing a paper of the needful from her pocket. "I always carry them now."

David broke up the long twigs into short pieces, from which he skillfully fashioned little chairs and tables, discoursing the while to Carey on the beauty and safety of the woods. Finally Carey acquired courage to hunt for wild flowers, though her hand remained close in David's clasp.

When they returned to the house Carey gave a glowing account of the expedition.

"Sit down on the steps and rest, children," proposed Mrs. Winthrop, "while Lucy prepares a little picnic dinner for you."

"What will we do now, David?" appealed Carey, when they were seated on the parch.

"You mustn't do anything but sit still," admonished her mother. "You have done more now than you are used to doing in one day.

"Davey will tell us a story," suggested Janey.

"Yes, please, David," urged Carey, coming to him and resting her on his inquiringly, while her little hand confidently sought his knee. Instinctively and naturally his finger closed upon it.

Embarrassed as he was at having a strange audience, he could not resist the child's appeal.

"She'll like the kind that you don't," he said musingly to Janey, "the kind about fairies and princes."

"Yes," rejoined Carey.

So he fashioned a tale, partly from recollection of Andersen but mostly from his own fancy. As his imagination kindled, he forgot where he was. Inspired by the spellbound interest of the dainty little girl with the worshiping eyes, he achieved his masterpiece.

"Upon my word," exclaimed Mr. Winthrop, "you are a veritable Scheherazade! You didn't make up that story yourself?"

"Only part of it," admitted David modestly.

When he and Janey started for home David politely delivered M'ri's message of invitation for Carey to come to the farm on the morrow to play.

"It's going to be lovely here," said the little girl happily. "And we are going to come every summer."

Janey kissed her impulsively. "Good-by, Carey."

"Good-by, Janey. Good-by, David."

"Good-by," he returned cheerily. Looking back, he saw her lips trembling. His gaze turned in perplexity to Mrs. Winthrop, whose eyes were dancing. "She expects you to bid her good-by the way Janey did," she explained.

"Oh!" said David, reddening, as two baby lips of scarlet were lifted naturally and expectantly to his.

As they drove away, the light feet of the horse making but little sound on the smooth road, Mrs. Winthrop's clear treble was wafted after them.

"One can scarcely believe that his father was a convict and his mother a washerwoman."

A lump came into the boy's throat Janey was very quiet on the way home When they were alone she said to him, with troubled eyes:

"Davey, is Carey going to be your sweetheart?"

His laugh was reassuring.

"Why, Janey, I am just twice her age."

"She is like a little doll, isn't she, David?"

"No; like a little princess."

The next morning Little Teacher came to show them her present from Joe.

"I am sure he chose a camera so I could take your pictures to send to him," she declared.

"Miss Rhody wants her picture taken in the black silk Joe gave her. If you will take it, she won't have to spend the money he sent her," said the thoughtful David.

Little Teacher was very enthusiastic over this proposition, and offered to accompany him at once to secure the picture. Miss Rhody was greatly excited over the event. Ever since the dress had been finished she had been a devotee at the shrine of two hooks in her closet from which was suspended the long-coveted garment, waiting for an occasion that would warrant its debut. She nervously dressed for the "likeness," for which she assumed her primmest pose. A week later David sent Joe a picture of Miss Rhody standing stiff and straight on her back porch and arrayed, with all the glory of the lilies of the field, in her new silk.

(To be continued.)

MOTHER'S APRON STRINGS

When I was but a verdant youth
I thought the truly great
Were those who had attained in truth
To man's mature estate.
And none my soul so sadly tried
Or spoke such bitter things
As he who said that I was tied
To mother's apron strings.

I loved my mother, yet it seemed
That I must break away
And find the broader world I dreamed
Beyond her presence lay.
But I have sighed and I have cried
O'er all the cruel stings
I would have missed had I been tied
To mother's apron strings.

Oh, happy, trustful girls and boys,
The mother's way is best!
She leads you midst the fairest joys
Through paths of peace and rest.
If you would have the safest guide
And drink from sweetest springs,
Oh, keep your hearts forever tied
To mother's apron strings.

—Nixon Waterman.

Give Farmers What They Want

To The Missouri Farmer:

I have been reading with much interest your articles on farm organization. Keep up the good fight, I am for you in all you say. I made a most desperate effort last spring to organize Howard County for a farm agent. But am sorry to say I failed. It seemed impossible to arouse the farmers, I just couldn't get helpers. My argument was to sell higher in place of buying cheaper. I advocated sending farmers to our legislatures in place of lawyers. This ruffled the lawyer and he at once got busy, they passed the word around to defeat the cause I am told and it became impossible to do anything. I made speeches all over the county and then sent to Columbia for a man, and explained to them what I wanted, what we were trying to do. We advertised it widely and had a splendid crowd. Our court room was full of people from all over the county. I met the man before time for the meeting and explained to him in detail what we were trying to do. And if you believe me he never mentioned a packer, cheap money, legislation or anything on that line. He talked on "soil and soil fertility." I have no doubt we needed that talk, but when a man goes to church he doesn't want politics, and if he goes to such a meeting as we had he don't want to hear that kind of a talk. They began to leave and by the time he had finished half were gone. Now such men simply paralyze such a movement. I registered my complaint with the college and they sent us a Mr. Gromer who was fine, but the damage was done, only a handful to hear him, and I thoroughly discouraged and sick. No one took up the movement and there it lies today. If some one will take up the movement I am more than willing to help.—C. T. B., Howard County.

Hatching Trouble Due to Negligence

Incubators holding from 150 to 250 eggs have given best results here, says F. S. Jacoby of the Ohio agricultural college. Their operation is more definite and certain than that of machines of different sizes.

During the hatching season, Mr. Jacoby says, one may reasonably expect to get 70 per cent hatchings if the stock is healthy and care is taken in handling the machine. Most instances of incubator failure are due to poor ventilation or improper regulation of the temperature in the room in which the incubator is kept.

WHERE THERE'S DRINK THERE'S DANGER

Write it on the work-house gate,
Write it on the schoolboy's slate,
Write it on the copy book,
That the young may often look,
Where there's drink, there's danger."

Write it on the church-yard mound,
Where the rum-slain dead are found;
Write it on the gallows high,
Write for all the passer's-by,
Where there's drink, there's danger."

Write it in the nation's laws,
Blotting out the license clause;
Write it on each ballot white,
So that it can be read aright,
Where there's drink, there's danger."

Write it on our ships that sail,
Borne along by storm and gale;
Write it large in letters plain,
Over every land and main,
Where there's drink, there's danger."
—Frances E. Willard.

FROM SOUTHEAST MISSOURI

Editor, Missouri Farmer:

Dear Sir:—I like your paper very much. I think it in class by itself. Have never read a paper that I liked better. Your's is always full of something good and the trash that is used to fill space in most farm papers the most of us have read from three to a dozen times before is left out. I believe you are really trying to help us. That you realize our difficulties and are trying to help us get together so we can help each other. I am in hearty accord with you in the stand you take against the methods of the packers. It seems to me they are engaged in a gigantic robbery. Taking from both, producer and consumer at the same time.

I paid $7.50 per cwt. in the fall for feeding shoats. They seemed to be worth it then. On December I was offered $5.00 for some of the same kind. The price the packers pay as you well know has depreciated about $2.00 or more per cwt. but the retail price of meat has not changed much. Something should be done as soon as possible. It seems to me that organization and co-operation of farmers is a very pressing need. I hope Mr. Hirth and Mr. Ellis will each find time to come to St. Francois County and address the farmers. I would like to see your paper read in every farm home in the state. Yours truly.

J. C. Ballard.

THEY LIKE DAVID DUNNE

We were sure our boys and girls of The Missouri Farmer family would like the story "David Dunne" but we wanted to find out just how discriminating they were in studying the different characters in the story. Another reason we had in asking them to write was to find out just what a fine lot of boys and girls really do read and enjoy The Missouri Farmer. And then we know it will help any boy or girl to develop the art of expression by getting them in the habit of writing good letters for publication.

In making our request for letters in a recent issue of the paper we inadvertently asked only for boys to write but the very first letter was a splendid one from "Irene" one of our fine little girl readers and we are going to give it first place to amend for our oversight. So next time we want all our boys and girls to know the invitation is extended to each of them to write a nice little letter either about "David Dunne" or some other matter of interest.—The Editor.

Irene's Letter

Montgomery City, Mo.

To the Editor:—

I have noticed in The Missouri Farmer that you want to know what some of your boy readers think of the story, "David Dunne." Though I am a girl I am very much interested in the story, and am always glad when the paper comes so I can read it. I think David is the main, and best character, but I am much interested in Joe Forbes, Miss Rhody, M'ri, and Janey. I don't like Jud much because he is not kind to David and Janey.

I hope this will be printed in The Missouri Farmer as this is the first letter of this kind I have written.

Irene.

(A very nice letter indeed and it is printed just as it was written, not a correction needed.—Editor.)

A Boy Friend on "David Dunne"

Brashear, Mo., May 15, 1916.

The Missouri Farmer:—

In answer to your favor, asking that your boy readers write you a letter telling what we think of the story "David Dunne" and which of the characters interest us most? I think the story is excellent and I am anxious to receive the remainder. The character which interests me most is David because one can sympathize with anybody more readily when they have a similar experience—my mother having died when I was eighteen, four years ago next Sept. 3rd. She was a good Christian mother and the day before she died she called me to her bed side and said, "Ralphy (for that is what she always called me) always be a good boy and never do anything that you would be ashamed for mother to know." She also asked me, what is home without a mother? I told her I did not know but I do know now. The memory of those words are as plain in my mind as if they were spoken but yesterday and they have been a guiding help to me all along the way I neither drink intoxicating drinks or use tobacco in any form of which mother was justly proud.

My father and I are batching, the rest of the children are married and gone, one brother in Colorado, another brother and sister five and six miles respectively from home.

In a conversation with father the other day regarding a petition which a neighbor boy and I signed he expressed his thoughts that we should not have signed it because we were not tax payers. I told him I would be this fall, but if we are not now we are good enough to go to war and fight for him and others who signed it that are too old to go to war.

Wishing you a happy future and may success ever crown your efforts. Here is one dollar for which please send the good news on to our home.

Ralph.

(Your father may have been right about the legal objection to your signing the petition but I think you have the decided advantage in the argument for the moral right to sign a petition when you are subject to call for the defense of your country. I hope you may write The Missouri Farmer again when you think of something of interest.—The Editor.)

THE GREEN CURRANT WORM

To The Missouri Farmer:

Will you please give me information as to what treatement my gooseberry bushes need. For the last two years small green worms begin working on the bushes soon after they bloom and by the time the berries are large enough to use the worms have the bushes almost stripped of leaves. As a result the berries are inferior.

Thanking you for any information you may give me.

Mrs. J. W. Burch.

Doubtless this is the green currant worm which strips the foliage off currant and gooseberry bushes and of course destroy the fruit. The remedy is to dust when the dew is on with hellebore 1 part and dry-slaked lime 4 parts; another formula is Paris green 1 part, dry-slaked lime 4 parts. The first is to be prepared after the fruit is three-fourths grown.

Five hundred tons of train stopped without a tremor!

The hand that plies the brakes and pulls the throttle controls your comfort.

It's a *skilled* hand that brings a million pound Wabash steel train from high speed to a dead stop, within a furlong; without causing a jerk or jar. It's a *skilled* hand that starts a Wabash train so gently and smoothly, yet so quickly that not a second is lost getting "under way."

One reason for the *extraordinary skill* of Wabash trainmen is the Instruction Car, established by the men themselves. This car, equipped with every train mechanism, gives demonstrations all along the line; keeping the men at top-notch skill.

Expert handling of trains is a special contribution to comfort, via

the new Wabash to Chicago

New steel equipment gives the Wabash two solid steel trains to Chicago and two other Chicago trains with steel equipment.

New double track has been laid; miles of it. Curves have been eliminated; grades reduced and 90 lb. rails put in.

New Pacific-type engines have been purchased; 2,000 h. p. giants that pull easily and smoothly, and maintain schedules.

New telephone dispatching promotes punctuality and safety; and block signals safeguard every mile of the way.

Altogether the Wabash has reason to be especially proud of its passenger train service and wants *you* to test it. Trains at

WORK OF MISSOURI POULTRY EXPERIMENT STATION.

"What is the work of a poultry experiment station?" This question is often asked by people who visit this Station. This would lead one to believe that because of a lack of knowledge concerning the work done, the people do not get the full benefit of the experiment station.

To give it in as few words as possible, we might say the work of a Poultry Experiment Station is to find out the things we don't know about poultry, then give this information to the public through the press, in bulletins, in lectures, correspondence, etc.

Is there any question concerning poultry you want to know? Is there any experiment you would like to see tried? If so, you should write it out and send it to an experiment station where the officials in charge will be glad to conduct the experiment or secure the information of whatever nature it may be, and report the same to you. Where people make use of experiment stations properly, they are of immense value as well as a point of economy to the entire state. To illustrate, if 5,000 people wanted to know the results of some one experiment, it is more economical to support an experiment station to conduct the experiment than for each of the 5,000 people to conduct the experiments separately, for that would mean 5,000 experiments tried. Then, too, the men in charge of these experiments at experiment stations devote their entire time to the experiments while others have other duties to perform which often makes a difference in the results observed.

The cost of the many experiments with poultry is therefore much less if conducted by an experiment station than by the people.

Missouri is perhaps as generous as any state in the support of its Poultry Experiment Station, yet one egg per year at market price for each person in Missouri will more than support the institution, and every one is cordially invited to send his problems to be worked out, whether he is a producer or consumer. It is not necessary that it be a deep problem with a big name, for some little problems are just as interesting and instructive. An example of a simple problem is, "how to boil an egg so it will pe smoothly?" It has been found by experimental work that the age of the egg is the principal factor which determines whether the white sticks to the shell or not, for if the egg is less than two days old, the shell does not come off satisfactorily, while an egg three or more days old, the shell comes off easily. Taking the eggs out into cold water perhaps assists some.

There are many experiments in progress at all times at this experiment station, the one which is perhaps best known is the egg laying contest from which many observations are made. This test begins November first of each year and continues for one year. Other experiments such as breeding, etc., continue for a number of years, while many experiments are determined in a few days or weeks, all tests being tried in season as near as possible; i. e., incubation and brooding tests are made in the spring, moulting tests in the fall, while other tests are made any time.

The first six months of the Fifth National Egg Laying Contest closed April 30th. The weather remaining cool, not as large a number of hens went broody as was expected, therefore the egg record for April was higher than for the same month in either of the previous contests.

The high water mark in egg production has been reached during either March or April in all contests held here at this Station, and during both March and April this year, the records have surpassed all previous records. The records for the first six months beginning November first each year; 1st contest, 63 eggs; 2nd contest, 68 eggs; 3rd contest, 76 eggs; 4th contest, 76 eggs; 5th contest, 81 eggs.

CHICKENS DYING WITH GAPES

To The Missouri Farmer:

I have some disease in my little chicks which I think is gapes. They will stand and stretch their necks and I can hear them breathe. Please give me a remedy and I will appreciate the information. Mrs. S. N. Groves.

The trouble is very likely gapes from the description you give and there is no very satisfactory remedy. The best thing to do is to kill a burn every chick you see gaping and then go to work and clean up the yards and try and get rid of the infection. If you want to try doctoring the sick ones put them in a clean coop and keep it clean while you are treating the chicks. Take a horsehair and double it to form a loop. Then dip the horsehair into a camphor or creolin solution and then holding the chick in the left hand with neck well stretched open the mouth and look for the gape worm which ordinarily may be seen in the throat. Putting the horsehair loop down the throat and withdraw it with twisting motion you can extract the worms. A little practice will give you the skill to extract them and every worm taken out should be burned.

A remedy some report effective is to place the chicks in a coop and give them a pint of water in which you put 30 drops of camphor spirits mixed with a little sugar. They will drink the camphored water if not allowed any other drink.

Generally it is not worth the trouble of bothering with sick chicks and the best way is to catch every sick chick kill and burn at once. Every worm the chick throws out will increase the danger of the disease spreading. The best plan is to change the yards occasionally and plow up the old yards and cultivate in some crop. Move the coops from place to place over the farm. A brood of little chicks will do very little harm in a corn field and may do a lot of good by eating insects injurious to corn. When the gapes are discovered we would clean up all the coops and houses and thoroughly wash with lime and crude carbolic acid or some other disinfectant. Then if possible move the chickens all to clean grounds. On the old grounds spread fresh lime until the ground is pretty white then spade or plow the ground and plant to some crop. In the fall plow the ground again and sow to rye and next year treat the ground the same way and if this is done thoroughly you will be pretty safe to let the chickens back on the old yards.

You say this is too much trouble? Well all the work of raising chickens is trouble and then if you lose them it is double trouble. If you would plan your poultry yards in two divisions and then after using one for two years for poultry, use it the next two years for a truck patch and change the poultry to the other yard you wo get the full benefit of the poultry manure in the truck patch and greatly reduce the danger from such diseases a gapes. Some poultrymen use small portable houses for the chickens and move then from one part of the farm to another, keeping the chickens always on clean ground. This is not a very difficult thing to do if you just get in the way of doing it.

BUCKSHOT BY THE PROFESSOR

If there's anybody in your neck of the woods who has been yelling for war, tell him that he is going to have a chance down across the Rio Grande in a few days. Then watch him squirm and twist.

It's one thing to be brave as a lion around the old stove in the cross roads general store—but quite another thing to dodge bullets amid the cactus and sage brush down in old Mexico. Don't get the idea that I am for peace at any price. Not by a long shot—but I can't help but get tickled when I think how a lot of the "loud" boys are going to "dodge" when they get a chance to go up against the real thing.

Old John D. seems to have as hard a time to find something that agrees with his stomach as the rest of us have hustling around to find something to put in our stomachs at all.

Better pay a little attention to the kind of fellows that are keeping company with that daughter of yours. A rumpus now is better than a divorce later on.

The fiddlers down in the land of forked tails and cloven feet can't hold a candle to the number of candidates down in my county.

Whenever Woodrow writes Emperor Bill a note, old John Bull sees that the censor doesn't hold it up. What old John thinks of "Bill" and what "Bill" thinks of John would break up a Sunday school convention.

What the harvest will be next fall depends a good deal on the fellow behind the cultivator in the meantime. Getting the weeds is more important just now than settling fine points of International Law.

They tell me that old "Josh" Simpson thought he "had 'em" the other day when a friend took him into a moving picture show and the piano started playing "Dixie" with nobody within 20 feet of it to do the "pickin."

A lot of fathers never give their children a kind word and then in later years they wonder why they leave home.

Rake up a five dollar bill somewhere, wrinkle up your old skin flint face into a real smile and tell your wif to go buy her the best hat she can find.

Some men are mean enough to deny the "kids" the privilege of going to the circus. Don't do it—for there are mighty few things in this World that are as generously worth the money as a good show nor to which we look back with more pleasure in the years to come.

To get that boy of yours really interested in the farm, it would be a good idea to make him a present of a gilt or two and give him what he can make out of them. All of us love most of the things that are really and truly our own.

There are a pile of farmers who howl about not getting a "square deal" for the things they produce but who haven't got energy enough to stand up for their own interests. I feel sorry for a natural born fool because he can't help it—but I haven't got much use for a fellow who has the sense but who lacks the initiative to take care of himself.

A solicitor for this paper approached an old tight wad farmer the other day and asked him to give him a dollar for three years subscription. The old tight wad shifted his "chaw" to the other side and said, "Naw, I guess not. I don't read farm papers much nohow and then I am gitten several fur nuthin' anyway"—and men of this type go a long way toward answering the question, "Why don't farmers stand together?"

A pile of the little school district Farm Clubs have saved a lot of money for their members and are fostering a friendlier neighborhood spirit—and it is up to the men who are blazing the way with these splendid little organizations to save our farm homes from the dangers which threaten them at this time.

There never was a tariff schedule written that wasn't "class legislation" and the public has always paid the bill and made the best of it. But now because it is proposed to exempt the Land Bank bonds from taxation a lot of fellows are throwing a duck fit about the "constitution."

By Old Jim Riley

Th' gang in my county are tryin' to keep a certain feller thats got "wheels" in his head from runnin' fur County Clerk because its one of th' best payin' offices in th' county an' because he don't belong to th' "bunch." So I said, "Why don't you git him to run fur th' Legislater—cause any durned fool is supposed to have sense enuff fer that"—and they all said that was a capital idee. Notice where that Professer feller has been seein' fallin' stars? Guess th' drug store must a switched brands on him.

HOW MUCH PROFIT

is there in a pig? That depends on the man, on the feed, and on the pig. But how do you know when the combination is right to produce best results? **Keep a Farm Account Book and let it be**

THE PRACTICAL FARM ACCOUNT AND RECORD BOOK

Complete Account of Hogs .. .. ., 19 14

Date	Person, Firm, or Account	Item, Description, Price	Cash Received	Cash Paid	Labor Hours Man	Labor Hours Horse	Labor Hours Tractor	Amount Charged	Amount Credited
Nov. 1	Corn Account	100 bus. corn @ 60 ¢						60 00	
Dec. 10	" "	80 bus. corn @ 64 ¢						51 20	

Charge the pigs with the corn they eat and then—

THE PRACTICAL FARM ACCOUNT AND RECORD BOOK is a splendid 176 page book, well bound and ruled on extra quality ledger paper. It is designed to contain the accounts of the average farm for five years. This is especially desirable for the purpose of comparison. The book also contains forms for crop, stock, employment, and insurance records.

THE PRACTICAL FARM ACCOUNT AND RECORD BOOK

Complete Account of Corn Crop , 19 14

Date	Person, Firm, or Account	Item, Description, Price	Cash Received	Cash Paid	Labor Hours Man	Labor Hours Horse	Labor Hours Tractor	Amount Charged	Amount Credited

Dec. 10	" "	80 bus. corn @ 64¢							51 20

Give the corn crop credit and that transaction is closed. Remember that in farm bookkeeping perhaps the greatest number of transactions will be between accounts on your farm.

We will give **The Missouri Farmer** for 3 years, either renewal or new subscription and a copy of **The Practical Farm Account and Record Book** for $2.25.

The Missouri Farmer, Columbia, Mo.

Live Stock Notes

R. P. ROYCE, Fieldman

Salisbury's Angus Sale Called off

We regret to announce that the sale of Angus cattle scheduled by E. H. Salisbury, Kirksville, Mo., for May 26 has been declared off. This announcement was made necessary because of a very disastrous fire the night of April 23 in which Mr. Salisbury lost thirty head of Angus cattle and eighteen head of registered Percheron stallions and mares. In addition to the loss of livestock, Mr. Salisbury's house and four large barns were totally destroyed. This is one of the most disastrous farm fires of recent years and Mr. Salisbury will lose a good many thousands of dollars over his insurance. We feel sure the fellow breeders of Mr. Salisbury will be deeply grievd to learn of his misfortune.

McGowan Plans a Fall Sale

Judge B. B. McGowan, New London, Mo., who has been advertising spotted Polands in this paper for the past two years is planning to hold a fall sale. This will be his first public sale and naturally the judge is bending every effort toward having an offering that will be a credit to himself and the breed.

Judge McGowan is one of the most ardent advocates of the spotted Poland China we have ever met and his herd is among the best in the state.

Andrews Stock Farm will hold Annual Sale in October.

Jim Andrews, proprietor of the Andrews Stock Farm, Lawson, Mo., whose annual sale of spotted Poland Chinas is always one of the events of the fall sale season advises us that he will "be on deck" in October with an offering that will make all the boys take notice. Mr. Andrews has been quietly doing things with his herd during the past two years and with good luck will be able to show something for his work. Watch this paper for further announcement.

Richly Bred Jerseys at Reasonable Prices

J. B. Smith, Platte City, Mo., is offering the readers of this paper a splendid opportunity to purchase exceptionally well bred Jersey cattle at prices that are in the reach of all. The Smith herd has been before the buying public for a number of years and at the various dairy shows this herd has always held its own. Mr. Smith has labored long to produce a Jersey type that would combine to the highest degree the highly desirable qualities of the Island bred Jersey and the American type. How well he has succeeded can be judged by his winnings and the records of his herd—all of which Mr. Smith will be glad to furnish any of our readers who may be interested.

Sunset "Correct Type" Jerseys

Notice change of ad of this old established Missouri Jersey herd in this issue of The Missouri Farmer. To keep the herd within their farm limit of 100 head they expect to sell 50 or 60 head of all ages, consisting of cows, bred and open heifers, young bulls, heifer and bull calves. They can fit out small herds for beginners and especially solicit this business. Mr. Ennis has been breding from carefully selected foundation stock for sixteen years and beginners buying now will secure the benefit of this sixteen years of work and will start right at the point that Mr. Ennis has reached after sixteen years of hard work. These cattle have not been bought up to re-sell but are simply surplus in the herd and are exactly the same stock in every way as will be left in the herd.

Mr. Ennis considers any of them good enough to remain in the herd and not one of them is being offered for any fault except a few old cows that have lost one quarter, will be sold at low prices and are very valuable for breeding as they were among the best cows in the herd. This herd has always been tuberculin tested, being one of the first herds tested when State Veterinarian Luckey began this work some ten years ago. It tested clean the very first time just as it did the last time, July, 1915. They have prepared a special circular, listing about fifty head, which they will be pleased to send on request. The breeding of th Sunset Herd is unexcelled as it is along the lines of Blue Belle and Golden Rosebay, two of the greatest cows ever imported. Prospective purchasers should ask for circular and mention their wants. Address, The Ennis Stock & Dairy Farm, Horine, Mo. (Just south of St. Louis.)

Will G. Lockridge to have a great offering for Fall Trade

Will G. Lockridge, Fayette, Mo., whose herd is so well known to the readers of this paper will have a great lot of pigs by The Giant, 1915, grand champion, Missouri State Fair, to offer the trade this fall. This herd has been before the public for a number of years and a fact worth noting is that it has been getting better every year. From a modest beginning it has come to be reckoned among the prominent herds of the state. Each year Mr. Lockridge has added a few real top sows until at the present time few herds can show a more uniform lot of big, roomy brood sows with quality. Naturally such sows when mated to a boar of the caliber of The Giant can hardly fail to produce a type of hog that will please any of our readers who are looking for extreme size. Mr. Lockridge is already receiving numerous inquiries and inasmuch as he will only offer the tops of his spring pigs it will be well to write him at once. Kindly mention this paper.

Blackwell's Angus

J. D. Blackwell, Fayette, Mo., writes that the demand for his cattle has been unusually active this spring and were it not for the fact that he maintains a large herd he would have been completely sold out. As matters stand, however, he still has on hand a number of young, well bred bulls and heifers that can be bought worth the money. If interested, write Mr. Blackwell at once.

Moore & Co.'s Holsteins

In a recent letter from W. H. Zimmerman, manager of the M. E. Moore Holstein herd at Cameron, Mo., he states that they have just completed a seven day test of one of their splendid cows, Violet Wayne Skylark 89705. This cow, although ten years old, gave 524.4 lbs. of milk yielding 21.4 lbs. of butter. In view of the age of this cow and the rather unfavorable weather during the test, the record is certainly good and Mr. Zimmerman is to be congratulated. This herd is the oldest herd in Missouri and for years it has been looked upon as one of the very best in the country.

Mr. Zimmerman advises us that t have a number of richly bred young bulls for sale and are prepared to make very attractive prices in order to move them at once. Please be good enough to mention this paper when you write.

Now is the Time to Buy O. I. C. Spring Pigs

Our readers who are interested in O. I. C. swine can not afford to overlook the offering advertised by S. D. & B. H. Frost, Kington, Mo. This vetran firm has been in the business of producing pure bred hogs so long, and is so wellknown to our readers that it is not necessary to dwell on their standing. Just now they are offering a splendid lot of spring pigs to be shipped at weaning time. These pigs are of early farrow, carry as good blood as the breed affords, and has been given an excellent start in life. Messrs. Frost will be glad to quote prices on single pigs, or pairs, trios or more of unrelated stock. Their herd is large and they are in a position to furnish beginners with foundatio stock. Every pig is guaranteed and the pedigree accompanies each animal sold. Write for prices and other information.

Richards & Son Pleased with Longfellow Sampson

J. F. Richards Jr. of the firm of J. F. Richards & Son, Bevier, Mo., recently told the writer that they were more than pleased with the way Longfellow Sampson was crossing on their sows and that the litters by him were every whit as good as those by their former herd boar Pawnee Price and were really showing more bone.

Messrs. Richards purchased Long fellow Sampson at the W. E. Williams depersion sale last fall and at the time the opinion was freely expressed that they secured one of the real bargains of the year.

Messrs. Richards are planning an October sale, and the buying public will do well to keep this sale in mind as it will undoubtedly afford exceptional opportunity to secure some choice boars by this splendid sire. The ability of Longfellow Sampson as a sire is unquestioned and breeders from now on are going to appreciate his blood more and more.

Longfellow Sampson formerly at the head of W. E. Williams herd and now at the head of the "Pen-Yr-Hyl" herd of J. F. Richards & Son at Bevier, Mo.

POLAND CHINAS

Smooth Columbus
THE BOAR THAT PUT MISSOURI ON THE MAP. HEADS OUR HERD

SMOOTH COLUMBUS BLOOD has held the record in Missouri for two years—it will do it again next year. Fall pigs, either sex, by this great boar, now offered for sale.

BENNETT BROS. R. 5, LEE'S SUMMIT, MO.

Spring Boars by the Grand Champion

A desirable lot of early spring boars by The Giant, acknowledged to be one of the greatest young Poland China boars of the breed. Prices within reach of all.

WILL G. LOCKRIDGE - - - - - - - Fayette, Mo.

Poland Chinas & Shorthorns

Bred sows and gilts. The real big kind with bone and quality. A few serviceable boars. Several extra good young bulls and heifers. Satisfaction guaranteed.

H. S. Williamson, Route 6 Centralia, Mo.

BAKER'S REAL BIG-TYPE POLANDS

We have a number of extra good spring boars sired by Big Look that we are offering worth the money. Need the room and must sell.

W. A. BAKER & SONS, BUTLER, MO.

Linhardt's Polands

I have a choice lot of extra good fall gilts sired by outstanding boars. Customers in 26 states. GIANT MAMMOTH 68375 and CHIEF BIG BONE 75856 in service. Priced for farm trade.

H. O. LINHARDT, LOHMAN, MO.

DOOLEY'S SPOTTED POLANDS

Big bone, spotted pigs now ready to ship —$25 single pig, $45 pair, $65 trio. Pair and trios no relation. Also registry furnished. Send check with first letter.

EDGAR DOOLEY, - Ettervile, Mo.

DUROC JERSEYS

THE BEST DUROC BLOOD--COL. WONDER

At recent Missouri State Fair my herd won 35 ribbons—3 championships, 15 firsts. Col. Wonder sires my champions—he will sire them for you. Choice bred gilts. Nothing but the best sent on mail orders.

CHAS. L. TAYLOR - - - - - - Olean, Mo.

Durocs With Size and Bone

I am offering a choice lot of early spring pigs with unusual size, bone and quality. Bred right and priced right. Visitors welcome.

A. C. BROCKMAN, R. F. D. 2, Centralia, Mo.

BIG EARLY DUROC SPRING PIGS

Pigs with size, lots of bone and quality sired by our big prize-winning boars, Col. Wonder II., Merry Chief, and Rexall Col., and out of big prolific sows. None from litters of less than 11. Spring pigs are cheapest to buy, costs practically nothing to ship them, and they can be grown cheaply.

R. L. (BOB) HILL ADENHILL FARM, - - COLUMBIA, MO.

DUROC HERD BOAR!!

We offer for sale our herd boar sired by Weller's Example and out of a Whiskey & Faith sow. Also a few September boars. Booking orders for spring pigs.

J. C. Garrard & Son, McBaine, Mo.

Hazelwood Durocs

Seventy choice spring boars and gilts sired by HAZELWOOD CHIEF, by CRIMSON COL., and out of OHIO CHIEF bred sows. Get our prices.

E. P. POWELL & SON, Maryville, Mo.

HAMPSHIRES

BROOKVIEW HAMPSHIRES

Herd headed by GEN. TIPTON and SIR BROOKVIEW, both grand champions. Spring boars and gilts of choice breeding and individuality. Prices reasonable.

ISOM J. MARTIN, - Kahoka, Mo.

RED POLLED

RED POLLED CATTLE

Herd established 16 Years

Young stock for sale. Young bulls sired by LOGAN 13500; Calves sired by KNOCKER 28791. Bred for milk and beef. Also offer spotted Poland China hogs and Rieds Yellow Dent seed corn.

M. L. SNYDER, - - POLO, MO.

AUCTIONEERS

THOMAS E. DEEM
AUCTIONEER

HOLSTEINS

Bought for you on small commission. What do you want? Price low. Feed short.

H. T. HOOK, JANESVILLE, WISCONSIN
(Formerly of Columbia, Mo.)

INTESTINAL WORMS IN PIGS

Intestinal worms are common in hogs and are particularly injurious to growing pigs. Insufficiently fed, neglected pigs living in dirty pens and yards, fed from filthy troughs, drinking contaminated water, bathing in old hog wallows, and rooting and sleeping in manure piles and stack bottoms soon become infested with worms; consequently they do not thrive, but develop into pot-bellied, rickety, profitless runts. Pens should be kept clean and dry and the manure frequently removed.

It has been asserted by various experienced feeders of hogs that a mixture of charcoal, ashes, lime, salt, sulphur, and copperas kept where the hogs can eat it will tend to prevent worm infestation. There is not as yet positive experimental evidence in support of the idea that such a mixture will prevent worm infestation, but the mixture does appear to satisfy the hog's desire for mineral substances and probably is of value as a tonic and appetizer. It may be made up in the following proportions:

Charcoal Mixture

Charcoal, 1 bushel.
Hardwood ashes, 1 bushel.
Salt, 8 pounds.
Air-slaked lime, 4 pounds.
Sulphur, 4 pounds.
Pulverized copperas, 2 pounds.

Mix the lime, salt, and sulphur thoroughly and then mix with the charcoal and ashes. Dissolve the copperas in two parts of hot water and sprinkle over the whole mass, mixing it thoroughly. Keep some of this mixture in a box before the hogs at all times, or place in a self-feeder.

Santonin, which was formerly widely used as a remedy for worms in hogs, is practically unobtainable at the present time owing to foreign conditions.

The following treatment has been found to be very effective against intestinal worms in experiments conducted by the Zoological Division of the Bureau of Animal Industry: Withhold all feed and water for 24 hours, then give each pig from 1 to 4 ounces of castor oil to which has been added oil of American wormseed as follows: Small pigs, 2 to 3 months old, 35 drops; pigs weighing 50 to 100 pounds, 50 to 100 drops, larger pigs, 1 teaspoonful.

Each pig should be dosed separately if the best results are to be obtained.

Dangerous to Drench Hogs

Drenching hogs is dangerous, as they are liable to get the remedy into the lungs. With sufficient assistance pigs may be held, the mouth kept open by means of a couple of loops of wire or rope, and the medicine given directly in a tablespoon. By this method, though it is troublesome, one may be certain that each pig gets his proper dose. After dosing, the pigs may be fed and watered. Repeat the treatment in 10 days.

Further information on swine husbandry will be found in Farmers' bulletins issued by the department, a list of which may be obtained upon application to the Division of Publication.

CARROLL COUNTY COOPERATION

Cooperation has proved a great boon to thousands of farmers in other states. We are often told that farmers won't work together because each one is so firmly wedded to the idea of doing things his own way. It is true that men in the country are compelled to think for themselves and work out plans which are different from those used by others, but when it becomes necessary for them to work together they can do so very effectively. This is clearly shown by a number of Carroll County groups.

Cooperative Beef Club.—For thirty years a beef club has been in operation in Prairie township, Carroll County. The rules and plans of the club are now so well organized that it may be regarded as a model to be followed with profit by many other sections of the state. Butchering takes place every Friday afternoon and the carcass is divided among sixteen families. Similar organizations have succeeded very well in many other parts of the country. It is quite general customary for each family to receive a different portion of the carcass so that in a few weeks or months any unequal division which may occur one week will be counterbalanced by a corresponding advantage or disadvantage in later weeks. Sometimes each family in turn furnishes an animal approved by a committee of the club and does the butchering. Sometimes the committee purchases and butchers the animal without calling on any member of the club and then sells the meat. In this case we have practically cooperative buying from members of the organization but without profit to those members who sell what they have bought for that purpose.

An Ice Club.—A number of enterprising farmers formed an ice club made up of men who join in purchasing a wagon-load of ice from a neighboring town and distribute it to the members of the club. In some sections a possible outgrowth of the idea might be a community ice-house, especially if a group of homes were clustered about a cross-roads, but where artificial ice is available it is often cheaper and always more sanitary than that obtained in winter from ponds or streams.—W. M. Cook, County Agent, Carroll County, Mo.

Sweet Clover May Pay in Three Ways

Honey, hay, and seed—three crops from the same acre—are the things that make white sweet-clover a promising forage crop for use under some conditions.

Sweet-clover will do better than alfalfa on lands which are wet, dry, hard or sandy. Two crops of hay, yielding about four tons an acre, may be expected under favorable conditions. Sweet clover seed sells for about $12 a bushel. Four, six or even eight bushels an acre are not uncommon yields. One crop of hay may be taken off and the second crop allowed to mature for seed. The bees can get a big supply of honey while they are helping to fertilize the blossoms.

Sweet-clover is one of our earliest pasture crops, and pigs do almost as well on it as on alfalfa. Tests at the Iowa experiment station showed that they did better on sweet-clover than on medium red clover. When the pasture becomes short, they will eat the big tap roots down as far as they can dig. Of course, this kills the plant. The Iowa station reports that hogs will not root out the plants if their grain ration is supplemented with meat scraps or tankage.

Besides being a good hay, seed and honey crop, sweet-clover, a legume, enriches the soil. The fleshy tap roots go deep after water and nutrients, and besides adding nitrogen from the air they add more than a ton of dry matter in roots to an acre. Being a biennial, sweet-clover fits into some rotations much better than alfalfa.

Sweet-clover has its disadvantages. There is a characteristically bitter vanilla flavor about the hay. If cut late, the hay has a woody stem that will not be eaten by stock. When cut young, however, it approaches alfalfa's in feeding value.

To get the best results, it is necessary to inoculate for sweet-clover. Two hundred pounds of soil from an alfalfa or sweet-clover field, having an abundance of bacteria present scattered on an acre and harrowed in will usually inoculate the plants thoroughly.

From ten to fifteen pounds of hulled seeds an acre will give a good stand. If planted alone, or with a nurse crop, it should be planted early. If allowed to reseed itself, it will grow indefinitely.—Minnesota Experiment Station.

Profit and Number of Acres

The size of business often has much to do toward making the farm profitable. Farm-management records show that farms are often either too small or too large for the most successful farming. There may be too few as well as too many acres. A man may not have enogh land or he may be "land poor", thereby rendering all his acres unprofitable.

About 30 years ago a Wisconsin farmer with a large family was deep in debt. His farm consisted of 120 acres, half of which was under the plow. For 12 years the farmer had not been quite able to meet his interest. To him the whole farm consisted of unprofitable acres. He finally decided that the farm was too small for the most efficient use of the labor available. Having an opportunity, he bought an adjoining 80 acres of cleared land, going in debt the full amount of the purchase price. From that time on the farm was prosperous, and in 10 years the entire farm was paid for and enough additional money saved to build a good house and barn. During this period there had been no great change in prices of farm products. The smaller farm had been unprofitable because the overhead expenses were too high for so small a business. In this case acres were made profitable by increasing their number.

In the early nineties a North Dakota farmer owned 3 quarter sections of land. His farm was quite heavily mortgaged and for a number of years he had not been able to pay interest in full. His family was small and for most of the work he had to depend on working, or trying to work, too many acres. Finally, he sold a quarter section and paid his debts. Seven years later he had $5,000 in the bank. In this period only account in part for this creased prices of farm products during farmer's increased prosperity. In this case all the acres had been unprofitable largely because there were too many of them.—J. C. McDowell, Office of Farm Management.

Relative Qualities of Fence Posts

The North Dakota Experiment Station estimates the life of a fence post made from cement at forty-eight years while that of steel is only thirty years. By dividing the cost of a post by the number of years in service will give the annual cost of a post. A good Osage orange post will last as long as a steel post and stands at the head of all post timbers for endurance Of course there is a great difference in the life of different posts made from the same kind of timber but the following is the average time the verious post timbers will last:

Osage orange, thirty years; locust, twenty-three and one-half years; red cedar, twenty and one-half years; mulberry, seventeen and one-half years; catalpa, fifteen and one-half years; burr oak, sixteen and one-half years; chestnut, fourteen and three-fourths years; white cedar, fourteen and one-third years; walnut, eleven and one- half years; white oak, eleven and one-half years; pine, eleven and one-fourth years; tamarack, ten and one-half years; cherry, ten and one-third years; hemlock, nine years; sassafras, eight and nine-tenths years; elm, eight and three-fourths years; ash, eight and one-half years; red oak, seven years; and willow, six and one-fourth years.

DISPLACEMENT OF HORSES BY TRACTORS

In investigating the value of the tractor from the farmer's point of view, specialists of the Department of Agriculture recently obtained from over 400 owners of tractors in Illinois reports as to the number of horses which the tractor had enabled them to do away with in the farm work. The following analysis of about 200 reports from typical corn-belt farms is taken from Farmers' Bulletin 719, "An Economic Study of the Farm Tractor in the Corn Belt."

"Many men look to the tractor to enable them to do away with the use of horses for farm work, at least in great part. To date, however, the tractor has not displaced horses to the extent commonly expected by purchasers, but its greatest advantage, as before mentioned, lies in the fact that it does the heavy work quickly, and thus completes it within the proper season, since it places at the farmer's command a large amount of power when needed.

"The tractor does displace horses to some extent, but only in about two-thirds of the cases where it is used on the same number of acres previously farmed. In these instances the horses displaced average only about four, and represent slightly less than 50 per cent of the cost of the tractor outfit. The number of horses displaced does not appear to vary to any great extent with the size of the outfit, about as many horses being laid off after the purchase of a small outfit as after buying a large one. The number will vary under different conditions, however, the principal influencing factors being the number of acres farmed per horse and the distribution of the work throughout the year. In the corn belt, horses are seldom displaced on farms where the average tilled acreage per horse is 30 or more. On the farms in Illinois where horses were displaced by the tractor, one horse had been kept for each 20 acres of tilled land. After the purchase of the tractor one horse was kept for each 30 acres of tilled land, or approximately the same as on farms on which no horses were displaced.

"There is much work on most farms for which it is neither practicable nor profitable to use the tractor. This is especially true in the corn-belt section, where cultivating frequently requires more power at one time than any other farm operation. Few, if any, tractors, according to reports received, are utilized for such work with entire satisfaction, and it is, therefore, necessary to retain a considerable number of horses after the tractor is bought.

"A study of the distribution of horse labor on a typical corn-belt farm, indicates that the peak load, that is, the greatest amount of work, comes about the end of May, which is the season when corn cultivating is at its height.

"On 92 Illinois farms where no change in the acreage was made after the purchase of the tractor, an average of 12 horses per farm had previously been kept. Two hundred and sixty-three horses were displaced on these farms, an average of not quite three horses per farm. On 31, or about one-third, of these farms, no horses were laid off.

"The raising of colts is an industry of considerable importance on farms in the corn belt, and it would seem natural to expect that where tractors were bought and the work stock thus relieved of the heavy field work the percentage of brood mares kept would be increased, and that the chances of raising more and healthier colts would be enhanced. It was found, however, that on a large group of farms in Illinois the brood mares constituted 33 per cent of the work stock before the tractors were bought, and while the work stock decreased to some extent after the purhcase of the tractor, the percentage of brood mares increased only 3 per cent, making the percentage now kept amount to 36 per cent."

SHORTHORNS MAKE FINE SHOWING IN MILK TEST

The Independence (Iowa) Testing Association offers some interesting records made in a recent test held under the supervision of the state, Mr. Frank Barrickman being the official tester.

The association covers 25 herds of Shorthorns, Holsteins, Guernseys and Jerseys. During the month of March the cows that produced 30 lbs. of butter fat or over, included 11 Shorthorns, 5 Holsteins and 2 Jerseys.

Roxie, a Shorthorn entered by Cook's Grove Farm produced 50.7 lbs. of butter fat at a feed cost per pound of 9c. This was the highest production of butter fat and the lowest cost per pound shown in the test.

Bertha, also a Shorthorn entered by D. E. Sullivan was the next highest, producing 47 lbs. of butter fat at a cost of 10½c per pound. This is the next highest record of production and the next lowest cost per pound with the single exception of Star, a Shorthorn entered by J. Fernau, her feed cost being 9c and her production 34.6 lbs. While the yield of this cow was sixth and her milk yield seventeenth in the list, her average test was the highest, being 5.9. Both Roxie and Bertha showed a test of 5.1. This percentage was only exceeded by a Jersey entry showing 5.4 with an aggregate butter yield of 31 lbs. at a feed cost of 15c per pound. The comparative yield of milk from Roxie, 995 lbs., and the highest Holstein entry, 1569 lbs., is striking in view of the fact that the Holstein milk tested but 2.8 with an actual butter fat yield of 43.9 lbs. as against Roxie's yeild of 50.7 lbs. and the feed cost per pound of the Holstein was 17½c as against 9c for the Shorthorn.

Frank D. Thompson.

Ralph Bingham discovers the "national joy smoke"

Copyright 1916 by R. J. Reynolds Tobacco Co.

Your money buys quality

Quality has been the only inducement ever offered men to smoke Prince Albert. Coupons or premiums have never been used with it. Prince Albert can in no way be affected by national or state restrictions on the use of coupons and premiums because its policy has always been for quality!

Quick as you light up some Prince Albert tobacco you'll realize how much you appreciate its freedom from bite and parch which are cut out by the patented process by which it is made.

PRINCE ALBERT

the national joy smoke

is the kind of tobacco you will like to get friendly with because you can smoke a lot of it and each package will appeal to your taste more than the last one.

On the reverse side of the Prince Albert package you will read: "Process Patented July 30th, 1907."

You buy some Prince Albert and try it right away—in a cigarette or a pipe—because it is so good you will be sorry you didn't know it long ago.

Prince Albert is sold everywhere in toppy red bags, 5c; tidy red tins, 10c; pound and half-pound tin humidors and in pound crystal-glass humidors with sponge-moistener tops that keep the tobacco in fine condition all the time.

R. J. REYNOLDS TOBACCO CO.
Winston-Salem, N. C.

POSSUM HOLLER DOIN'S

A fairly good bunch rounded up at "Hez" Brown's Store last Saturday and "Jep" Thompson lighted the fuse by saying, "Well, all of you fellers that have been yellin' for war had better finish plantin' corn as quick as you kin, 'cause before you git it laid by the bullets are goin' to be whizzin' down across the Rio Grande. There ain't no way stoppin' it now. It's just like kickin' a barrel into th' river above Niagry Falls. It's just a matter of time until it's goin' over and it's the same way down on the Mexican border. There may be a little more of this diplomatic stuff but afore long it means war just as certain as the Lord ever made little apples—and I wouldn't be surprised to see it start any minit."

"I think you'v' got it sized up about right" said the Judge as he contemplatively crammed some long green down into his old cob pipe. "And let me tell you gentlemen, it's goin' to be a lot nastier job than most of us is figgerin' on. I don't look for many big battles 'cause they ain't goin' to meet us in the open more than they have to—but there'll be a pile of bush-whackin' as we used to call it durin' the Civil War and many an American soldier boy is goin' to bite the dust when there ain't no enemy in sight. There'll be a treacherous Mexican behind every rock and clump of sage brush. Somehow the Greasers seem to haven gotten the idee that they can lick the United States. They think Villa is one of the greatest generals that ever lived and if we git into a real sure enough scrap, I wouldn't be surprised to see him commandin' the whole outfit. Of course, in the end, we'll lick the stuffin' out of 'em but we'll have to pay a big price to do it—and I am thinkin' that after we've had five or six thousand of our soldiers killed and have spent four or five hundred million dollars, a pile of the American people are goin' to want the flag to stay there fer good."

This last remark alarmed "Jep" Thompson who blurted out, "But Woodrow said at Philadelphia over a year ago that we would never annex another foot of new territory in th' Western Hemisphere." "I know he did," calmly replied the Judge, "but the people will have sumthin' to say about that before it's all over. We said we didn't want no new territory when we started in to lick Spain either but we took water on it—and to this day the most of us are sorry that we didn't take Cuby and let the Phillipines alone. The only reason we want to git rid of the Phillipines is because they are within gun range of the Japs. You see Mexico is naturally a part of the United States. It ain't like takin' land down in South Amerika. And we are livin' in a pretty practical kind of a World. Just mark my prediction—if we git a lot of men killed and spend hundreds of millions of dollars cleanin' up Mexico we are goin' to stay there fer all time to come. I feel sorry for the poor ignorant "greasers." They'v' bin imposed on by a lot of big land-lords for years an' have bin no better off than a bunch of slaves—and after they find out the way we do things they'll be tickled to death to have us stay. Don't you think that every Mexican who's got a thimble full of brains and who has watched the murderin' and robbin' which has took place under old Diaz, Madero Huerta, Villa and Carranza is heart sick of the whole business? No, boys, if we ever unfurl the old flag over the Palace in Mexico City it's mighty apt to stay there—and it will be the best thing that ever happened for the Mexicans and there ain't a foreign country that won't be glad of it."

"I don't think that would be right" said "Jep." "The Mexicans is just as much intitled to liberty as anybody else an th' American people can't consistently deny 'em this right. From Bunker Hill down to this minit we'v' stood fur government by th' consent of th' governed." "Oh, I know all that," replied the Judge, "but what's the use of talkin' about liberty in a Country where liberty ain't got no place to lay it's head? What's the use of talkin' about liberty in a Country where a handful of thieves are out after the stuff and where 95% of the population woudn't know a constitution from a long horned steer? The only thing I am sorry about is that we'v' fiddled around and talked with that old whiskered Billy Goat down there so long that it's goin' to cost us two li[illegible] today where it wouldn't have cost one-three months ago."

At this stage of the game, Old Jim Riley dropped in and with a wink to the rest of the crowd proposed to take up a collection to send old "Chouce" Baker to Kansas City to have him converted by "Billy" Sunday. No sooner was the proposal made than everybody but "Jep" Thompson yelled, "I am in!" "Jep" allowed it would be "playin' a mean trick on Billy." "Why," said he, "Billy would stand a better show tryin' to round up my old blind mule"—to which "Chouce" replied sarcastically, "Whenever I need convertin' I won't let an outfit that's too blamed lazy to cut a little stove wood for their wives to cook vittles with pay my railroad fare."

"Americanism"

That we are living in the midst of one of the most remarkable epochs in the World's history is apparent to all thinking men. In fact it is so remarkable that for the time being the most of us have been overwhelmed by its true significance and not until the storm shall have passed and the atmosphere shall have beccome somewhat cleared of the flying debris will we be able to understand the larger meaning of a cataclysm which is without a counterpart in all human history. That in the public press and in the public forum here in the United States we should be profoundly moved by these remarkable passing events is entirely natural —for as a people we think and talk in untrammeled fashion. Again, there is ample reason why we should be deeply concerned. In the first place, we constitute the most powerful neutral nation in the World at this time and hence there is a certain moral responsibility which we cannot escape even if we would. Again, we have in the vaults of our great banking houses two-fifths of the World's gold supply at this time—and this alone will compel us to play a larger part in the World's affairs from this time forward than ever before. Lastly, our commercial interests are as wide as the ends of the Earth and in order to maintain our proud position in this respect in the years to come we will have to "play ball" —nor can we afford to "muff" it very often if we would uphold the enviable prestige and wealth which is ours at this time.

And yet, should we not be able to assume these profound responsibilities without losing our heads? Is it not in fact a time above all others when we should not fly off on some wild and mistaken tangent? Sooner or later peace will come to troubled Europe and unless the writer is greatly mistaken, in that hour her statesmen will realize the folly of a tragedy which will have changed the boundary lines of nations very little and yet which has sent to an untimely grave the flower of European manhood while generations yet unborn will be compelled to stagger under war debts without precedent in history. The thing I protest against is the hysteria and frenzy which here lately seems to be taking possession of many of our people and which apparently proceeds upon the theory that the whole World has gone permanently mad and that war rather than wholesome thrift and culture are to be the chief ambitions of Nations from this time forward. In saying this I do not for one moment plead against an adequate Navy and Army—for within reasonable limitations such agencies are guarantees of peace and as such deserve the support of all right thinking men. But let us go about the creation of these forces in an orderly and quietly determined manner. Let us have it clearly understood that these measures are purely defensive and that in the future as in the past ours shall be a land pledged to the conquests of peace rather than of those of the sword. For, rest assured, the World has not gone permanently mad—and once the smoke of battle clears away and the marching legions return to the domestic love and quiet of their saddened firesides it will be many a long day before they willingly enter upon another tragedy such as the one which has made the very rivers of France, Belgium and Poland run red during these long weary months.

Above everything I protest against the mistaken zeal of those who are seeking to sow the seeds of discord among our own people by raising the false issue of "Americanism." That the German should sympathize with the "Fatherland" or that the Frenchman should be deeply concerned over the fate of France—these sentiments are but natural and yet never has there been an hour when our beloved Republic was in danger that these men have not instantly rallied to the flag. As Baron Stueben was the chief military genius back of the Colonial Army, so Lafayette bared his breast in the cause of American liberty—and together they constitute a splendid heritage of our hallowed past. And so, at peace among ourselves, let us not indulge in the belief of a mistaken security—while upon the other hand let us keep the fires of peace and liberty ever brightly burning upon the altar of the Nation.

LYONS PRACTICAL FARM PAPERS

Nearly every Saturday afternoon, from three to five o'clock, from four to ten farmers may be found, waiting for the women folk to get through trading, and as they wait, they occupy the chairs set on the sidewalk by the hospitable hardware man, and the liveryman, whose places join. I often help to make up the crowd, and we have some good farmers meetings, as the talk is always mainly on seasonable farm topics.

We got to talking on early planting, the other day, and there was scarcely a dissenting voice to the proposition that taken as a rule early planting of all farm crops is best. May 10-25 is the season that most of the corn is planted here, and in speaking of the variation in time of planting, two men said that they had successfully planted as early as April 25, while I once planted six acres April 20, making an extra heavy crop. Four of seven present had planted Leaming as late as June 25 and grew mature crops. One had matured Sanford flint corn planted July 15, and I told of once planting two acres of Leaming July 5.

This corn did not mature enough for seed, but it made a heavy crop of ears, and I recall the fact that I fattened my hogs with it. All agreed that the Leaming corn of 1916 is not as early as that of twenty years ago, but that it is more fermentive than it was then. I remember it thirty-five years ago, when three neighbors and I sent to the originator for a bushel of seed, and only one of the four planted it the second year, as it was not large enough to suit our soil and climate, but at our fair last fall I saw two samples of pure Leaming of eleven inch ears.

Three of the seven men had planted garden beans on May 5-6, and here I was early man again, for I had planted ten days earlier and they were coming up.

It is my rule to plant beans early, rows two feet apart, three or four beans to the hill, about a foot between hills, for the bunch varieties, and if they come up well thin to two plants. If the weather is cold and wet, they sometimes rot, in which case I only lose a little time and an hours work, if they come up well I have extra early beans for table use

Father used to market fruit and vegetables to near by towns with spring wagon and team, and often had sweet corn to sell by July 10. In order to do this, he always sprouted his seed, often getting sprouts an inch long before planting, getting the seed in the ground by April 25, and I have known him to sell small ears of sweet corn at 30 cents a dozen.

Writing this May 19, we are done planting corn, and had a white frost this morning. A few years ago, about 1895, we had a heavy snow on this date, and in 1880, no corn was planted.

It is dry but rain is promised.

TO CONTROL THE HOUSE FLY

Flies are best controlled by caring for manures, the places where they breed. (a) Haul out and spread the manure once a week. (b) Store the manure in a dark shed—flies do not breed in dark places. (c) Treat the manure to kill the maggot and eggs. Where it is necessary to have manures exposed to flies, it may be treated with borax or hellebore as follows:

Borax.—Powdered borax sprinkled over the manure at the rate of three-fifths pound to 8 bushels of manure and 2 or 3 gallons of water poured over the borax-treated manure to wash the borax into the manure will kill the maggots and keep the eggs from hatching. The outer edges of the manure pile should be carefully sprinkled as this is where the maggots congregate for pupation.

Hellebore.—Powdered white hellebore when made into a solution by mixing one-half pound of hellebore to 10 gallons water and sprinkled over the manure gives good results in killing the fly maggots. This solution can be made up into large quantities and kept until wanted for use.

The manure can be treated in the stable without moving it. The manure composition will not be changed by using either the Hellebore or Borax. Animals will not be in any danger when manure is treated in the stables as the poison is washed into the manure.

Maggot Trap.—This is a simple method to kill the fly in maggot stage—full information can be had by writing to Bureau of Entomology, Washington, D. C.

Screen the Privy Closets.—Have the closet provided with a keg or barrel of air slaked lime and use freely to dry up the closet material.

Traps.—Make or buy fly traps. Place them in windows at the stables, hog pens, and chicken houses.—Press Bulletin.

Beautifying Grounds Increases Farm Value

A few trees, shrubs and flowers planted in appropriate places about the house and other buildings actually add to the cash value of the farm and, at the same time, give a simple beauty and inviting appearance to the farm home that make it a more pleasant place to live in.

When buying a farm, many are only too glad to pay more for a place that is neat, well arranged, and made attractive by such things as lawn, shrubs, orchard, and grove, all in their right places.

F. A. Aust of the Agricultural Experiment station of the University of Wisconsin offers these hints on home grounds planting: (1) The house is the central feature and should occupy the most prominent location; (2) Other buildings are best put farther from the road and should, if possible, be screened off by trees and shrubs; (3) The lawn, being the foreground of the home, should look inviting, and should seem to say, "Come and rest," rather than "Keep off"; (4) Shrubs are of good service, especially for filling in empty-looking places and screening off unsightly objects, (5) Vines give shade and beauty to the porch, and may be well used to cover fences, walks, and out-houses; (6) Flowers lend variety and color, but as a rule should be made into borders rather than to occupy conspicuous places; (7) Walks, drives, etc., are best when inconspicuous; (8) Straight rows of trees or shrubs, and straight walks and drives are apt to be stiff and formal; curves are more graceful and pleasing; (9) Beauty lies, first of all, in simplicity and harmony. A few shrubs and trees arranged with some plan are more effective than a multitude scattered about aimlessly. Every single plant should fit in its place and not be out of tune with the rest.

Improvements in Kerosene Lighting

In artificial lighting there are two important factors to consider; (1) The cost per unit of light, and (2) the character of the light obtained with respect to its efficiency for the purpose for which it is intended. While the old style kerosene lamp probably furnishes the cheapest light which can be obtained, it is also the most inefficient, in that the yellow light produced is very far from the daylight which it is intended to replace. The most efficient light is the light which most nearly resembles daylight .

Up to a few years ago it was not considered possible to burn kerosene except in a wick lamp and other forms of fuel were advocated which could be burned under the so-called incandescent mantle because by means of this mantle a light much more closely resembling diffused daylight could be obtained. With the introduction of the mantle lamp for kerosene, however, artificial ligthing in the farm home can be made very efficient as the character of the light depends not on the fuel but on the character of the mantle which is used. The kerosene mantle lamp requires somewhat more care than the ordinary lamp. The mantles are fragile and tend to blacken if the wick is not kept properly trimmed. Portable mantle lamps have also been devised for the use of other fuels.

With the introduction of denatured alcohol a fairly cheap fuel for lightin has been made available. Alcohol i in some respects more desirable tha kerosene in that there is less dange of fire because alcohol can be extin guished with water; there is less ten dency for the blackening of the man tles; and possibly most desirable o all, the disagreeable odor of burnin kerosene is done away with. At pres ent, however, even denatured alcoho is much more costly than kerosen and unless these secondary considera tions just mentioned outweigh the dif ference in cost kerosene should b used. The mantle lamps are mor costly than the ordinary kerosen lamp, ranging up from $3.00, while th ordinary lamp can be bought for fro 50 cents to $1.00. The character o the light from the two styles of lamp however, cannot be compared an where any amount of close work, suc as reading or writing or sewing, is t be done by artificial light the ligh which is least harmful to the eyesigh should receive first consideration.—F M. West, Assistant Agricultural Chem ist, University Farm, St. Paul.

A Helping Hand

We could make The Missouri Farm er much more interesting if we coul induce our readers to write more fo the paper. We want you to feel tha this is your paper—a real farm an home paper with nothing in its col ums you would object to coming int your home. But it must be more tha that—it must be both instructive an interesting and to this end we urg our readers to write us their experi ences about farming or farm life tha we may build up a great family circle

Forty-one Years of Telephone Progres

The faint musical sound of a plucked spring was electrically carried from one room to another and recognized on June 2, 1875. That sound was the birth-cry of the telephone.

The original instrument—the very first telephone in the world—is shown in the picture above.

From this now-historic instrument has been developed an art of profound importance in the world's civilization.

At this anniversary time, the Bell System looks back on forty-one years of scientific achievement and economic progress, and gives this account of its stewardship:

It has provided a system communication adequate public needs and sufficiently advance of existing conditio to meet all private deman or national emergencies.

It has made the telepho the most economical serva of the people for social a commercial intercourse.

It has organized an opera ing staff loyal to public i terests and ideals; and by policy of service it has w the appreciation and good w of the people.

With these things in mi the Bell System looks f ward with confidence to future of greater opportun and greater achievement.

The Missouri Farmer

VOLUME VIII JUNE 1, 1916 NUMBER 11

There is Something Lacking

By Geo. B. Ellis, Managing Editor

Agriculture needs a new declaration of independence. One hundred and forty years ago when the great Thomas Jefferson wrote the Declaration of Independence, among other eternal truths he penned this one: "All experience hath shown, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed." This is just as true of the wrongs inflicted upon society by false economic theories and customs as it is of bad political government. But the time has come when the burdens placed upon agriculture are no longer sufferable and we need something of the spirit of 1776 to free ourselves from the political bondage under which agriculture has so long been a patient sufferer.

Missouri is among the few great farming states of the Union—quite half the population of this state is rural but when it comes to taking part in the government of the state the voice of the farmer is seldom heard and less often heeded. Farmers have a larger representation in the legislature than any other branch of the state government but even there the representation is not in proportion to their relative numbers. If we have had a real farmer in the executive offices it was so long ago it has been forgotten. Do these things just happen so or may we find a real cause for them?

Farmers Are Not Equally Represented

Missouri has sixteen members in the National Congress but there is not one of them capable of representing the agricultural interests in matters that vitally affect the life and prosperity of country people. A few months ago when the packers were bleeding the meat producers to the point of bankruptcy and the Missouri cattle, swine and sheep feeders through their state association demanded relief, they had to get their plea before Congress through one who represents the largest packing district in the state and who though both able and honest will as a matter of course be largely influenced by the will of the people in his own district. The farmers and feeders who have been losing money feeding cattle and hogs in the face of a world shortage of meat animals can give plenty of reasons for making an investigation of how the packers control the markets but when this matter went to Congress with their grievances all that body has done after four months deliberation is to instruct a committee to make inquiry and find out if any investigation is needed.

Missouri has a great State University upon which millions of dollars have been spent under the management of a board of curators not one of whom is a farmer or more than remotely interested in farming and yet the largest of the scientific departments of the University is the College of Agriculture. The latter department has a salaried force of seventy-five or more who are employed to instruct farmers and to train teachers for farmers but out of the whole bunch not more than four or five are real Missouri farmers. Perhaps it would not matter much, if the teaching in the College of Agriculture was confined to merely abstract technical subjects, whether the teachers had any successful experience in farming or not. But when there is a demand for information on every conceivable practical subject relating to every phase of farming and of farm management and when the College of Agriculture essays to teach farmers all these things then in the name of reason is it not about time that men of successful experience as well as good training be chosen for farmers' instructors?

Rural Credits and Farm Marketing the Leading Questions

There are just now a number of very important public questions receiving attention but if I were asked to name those of very first importance I should after very careful consideration give first place to "rural credits" and "farm marketing." In naming these two first I am sure I do not under value the importance of such pressing needs as good roads, rural high schools and better transportation. A sound system of rural credits which has kept the land well under the control and in the hands of the farmers has been the stability of both Germany and France for almost a century.

A simple business-like plan for the marketing of farm products under the management of farmers has changed the little country of Denmark from a condition of bankruptcy in 1889 to the most prosperous of all the countries of Europe twenty-five years later. But here in America where we sometimes forget ourselves and boast that we have the most intelligent agricultural population in the world, the small farmers are yearly crowded to the wall and forced to become tenants, the tenants are reenforcing the class of hired-men and already fewer than one-fifth of the farm owners of America own approximately three-fifths of the land. At that rate how long will it be until a few men will own the land and we in "free America" will be facing the same problems which have produced revolution and famine in both Mexico and Ireland? But in the face of these serious and vital questions to be considered and settled either in the interest of the farmers and the country or in favor of a land lord system, the President of the United States when he selected his "farm adviser" for the Cabinet overlooked and ignored the six million farmers of the country and the scores of scientifically trained men whose lives have been spent in the betterment of farm conditions and chose for the Secretary of Agriculture a man who neither by sympathy, training or occupation was fitted for his place.

And so it is in all our institutions in this state, in other states, and in the Nation the men who are chosen to represent farmers and to speak for them wherever and whenever the farmer's interest may count with the interest of others are not always able to do it.

Farmers Must Manage Their Own Affairs

And so I say "something is lacking" before the farmers of this country may hope to get a square deal and that something is a declaration of independence to be entered into by and between the six million farmers of America that they are going to take the management of their own affairs into their own hands and direct them in their own way. Before the recent Conference on Marketing and Farm Credits held in cooperation with the National Council of Farmers' Associations at Chicago, Sir Horace Plunkett, founder and president of the Irish Agricultural Organization Society, a patriot farmer who has spent thirty-six years of his life working for the emancipation of the Irish farmer from a sytem of oppresion unknown to any other civilized country had this to say on this question: "If you would solve the rural problem you must approach it from three points of view. You must regard agriculture as an industry, as a business, and as a life. To the industry must be applied the teaching of modern science, and that is the work of government and of educational authorities. Into the business must be introduced the methods practiced by those engaged in every other occupation, and far the most important of these methods is combination, whenever things can be done more efficiently or more economically, collectively than individually. **This, we hold, is the function of voluntary effort. It is work which cannot be done for the farmers, but must be done by them, and even the way in which they are to do it cannot be taught to them by governmental agencies."**

Must Build From the Bottom

The Missouri Farmer has since its establishment six years ago been trying to get the farmers of the state to see this one essential thing and that is that the work of bettering the business side of farming "is work which cannot be done for the farmers, but must be done by them independent of outside interference." It is a big problem but a vital one to get the farmers of a great country like the United States to working in a large cooperative combination for their own betterment and for the good of the whole country but by building from the bottom on a safe foundation it can and must be done.

Now just a word about how to get farmers to help themselves. There are approximately ten thousand rural school districts in Missouri. There are twenty-five to thirty farmers living in each of these districts and most surely at least ten men may be found in the most backward and unpromising district who are ready and willing to stand together for their individual gain and for the general good of the community. But whether there are ten or but two such men we want to begin right and like all other structures the place to begin is on the foundation. Just as we suggested in a recent article in The Missouri Farmer that in many neighborshoods no more than two or three men could find it to their mutual advantage to cooperate in the breeding of pure bred animals so why can not two or three men cooperate in the buying of binder twine, fertilizers, coal, feeds, seeds and other like products?

A Few Men Can Start the Work

We do not want to be understood as advising that an organization of a few men is the most desirable but it is a start and if these few men can demonstrate that they can save money by working together others will soon be wanting to unite their efforts and the usefulness of the organization will grow and its benefits multiply. A few weeks ago an energetic farmer called a few of his neighbors together and proposed the organization of a farm club when they all asked "what can we do?" This was in a neighborhood where a considerable acreage of wheat is sown and the leader who had prepared himself for such questions proposed that they club their orders for binding twine and buy their twine from the State plant at Jefferson City. The state plant is selling twine in 1000 lb. lots for 9 cents a pound which is a big saving this year over retail prices. These few farmers saved enough on the price of twine for this harvest to pay the wages of a good farm hand for three months and no one would have thought about it had they not been called together by one some are unkind enough to call "cranky". In a very short time these men will buy several tons of fertilizer for next year's wheat crop and by clubbing their orders and buying in car lots they can make a saving of one to two dollars a ton and that amount of saving applied to the whole fertilizer bill for the state would mean a saving of more than one hundred thousand dollars. When one thing has been bought another will be suggested and the saving will reach millions of dollars a year to Missouri Farmers.

The whole thing lacking to make

farm organization a success is for farmers to depend upon their own efforts and to direct their own agencies. The farmer who is awake to his own interest and who has at heart the good of his community and his state will be ready to join his neighbors in the organization of a farmers business club and this is the only kind of organization that will give the men who produce the world's food and clothing an equal chance to share in the good things of this life. Let our motto be "Farming is a business controlled by business farmers."

COOPERATION AT WORK

In the cooperative marketing of farm products, Denmark and Ireland stand head and shoulders above all others in the brillancy of their achievements and the permanency of results. Fifty years ago the farmers in both of these countries found themselves in a pitiable condition—worse than the farmers in any part of the United States ever were or ever dreamed of being. They were destitute, despondent and hopeless, and there was nothing but poverty in sight. Up to 1880 Danish and Irish farmers had gone along in the same old way—small farms, small crops, small prices, discontent, discouragement, discord, disease, degeneration and decay. But a few rare spirits saw a vision and became convinced that farmers must combine and work together in order to prosper individually. A cooperative creamery was organized at Olgod in Denmark in 1882, and now there are over 1,300 of these creameries, exporting over a million dollars worth of butter every week. Denmark has 36 cooperative bacon factories, 510 cooperative egg testing associations, 1,200 cooperative retail societies, 560 cooperative savings banks with deposits of over $215,000,000, also 519 cow testing associations and 1,260 cattle breeding associations. Denmark is about one-fourth the size of Illinois, and yet she exports annually over $90,000,000 worth of butter, eggs, cheese and meat! From poverty and destitution 40 years ago it has come to be the richest country per capita in Europe according to its population, and 89 out of every 100 families own their own homes. And we behold today a new Denmark!

And we behold a new Ireland. No country could possibly be in a more pitiable condition a few years ago, and yet today Ireland is commencing to blossom like a rose. In many parts it is said to be as rich and prosperous now as the best portion of our own great Middle West. And this great regeneration has come about through the efforts of a band of cooperative missionaries—Sir Horace Plunkett, a nobleman, Mr. R. A. Anderson, a farmer, Mr. George W. Russell, the brilliant editor of the Irish Homestead, and Rev. Father Thomas A. Finlay, professor of economics in the National University of Dublin. Each of these has been preaching the gospel of cooperation over Ireland during the last 20 years. It took 50 meetings, covering a period of more than a year, before these missionaries could get the farmers to organize a creamery. The first one was established in Limerick in 1889. It was a year before another one started. Today Ireland has nearly 500 cooperative creameries, 980 cooperative societies all told, with a paid-up capital of over a million dollars and an annual turnover of something like $12,000,000. And so we are told that the salvation of Ireland is being worked out by a big cooperative scheme in which local societies, the wholesale society, the agricultural department of the government, the Irish Agricultural Organization Society, the Irish Homestead and the society of United Irish Women are all playing important parts. This is cooperation at work. W. M. Stickney.

LOOK OUT FOR CLOVER BLOAT

A correspondent says that he has lost a fine steer which was running on a pasture of white clover of very rank growth, and he can attribute the cause of death to nothing else but bloat. From the appearance of the steer when found dead he thinks it was the bloat which caused death but he says "I have never known of white clover causing bloat and would like to know about it."

In ordinary seasons there is very little danger of bloat running on white clover and especially where the clover is well mixed with bluegrass or other grasses but where white clover makes a vigorous growth like it has this year and when it constitutes practically the entire grazing there is considerable danger. The two dangers in our opinion are first, when changing from dry feed to pasture and second, about the time it is in full bloom. If cattle owners will change from dry feed gradually they will not run so much risk of bloat. For this reason it is always best to feed the cattle several days after they are turned on the pasture and where there is danger of bloat we would turn on the clover just after feeding the dry feed and not allow them to graze only for a short time, say twice a day and follow this up for several days.

When the clover is coming in full bloom if there is any notice of disposition to bloat it will be best to find another pasture for a while at least until the bloom begins to brown at least. Bloat is caused by the rapid fermentation of the food in the stomach, at least this is one cause, and it has been found that blossoms of white and red clover and also of alfalfa contain a great deal more sugar than does the leaves. The Kentucky station has found that red clover blossoms contains as much sugar as 3.6 per cent, alfalfa 2.8 per cent and white clover 2.4 per cent. In the fermentation of the food the sugar is converted into carbon dioxide gas and from this farmers will readily understand why it is that that red clover causes more trouble than white clover when it has fifty per cent more sugar in the blossoms.

The Bureau of Animal Industry in Diseases of Cattle says that bloat "may be caused by any kind of food which produces indigestion. When cattle are first turned into young clover they eat so greedily of it that tympanitis (bloat) frequently results; turnips, potatoes, and cabbage may also cause it; middlings and corn meal also frequently give rise to it. In this connection it may be stated that an excessive quantity of any of the beforementioned foods may bring on this disorder, or it may not be due to excess, but to eating too hastily. Sometimes the quality of food is at fault. Grass or clover when wet with dew or rain frequently disorders digestion and brings on tympanitis; frozen roots or pastures covered with heavy frost should also be regarded as dangerous. When food has been eaten too hastily, or when it is cold and wet, the digestive process is imperfectly performed, and the food contained in the paunch ferments, during which process large quantities of gas are formed. The same result may follow when a cow is choked, as the obstruction in the gullet prevents the passing up of gas from the stomach, so that the gas continues to accumulate until tympanitis results.

Farmers will generally have no trouble in diagnosing the trouble from the distressed and swollen condition of the animal. If relief is not obtained in time, the animal breathes with difficulty, reels when walking and in a short time may fall and die from suffocation. The Kentucky station recommends for "acute bloating, 1 quart of a 1½ per cent solution of formalin, followed by placing a wooden block in the animals mouth, and gently exercise if the animal can be gotten up. Formalin is a trade name for a 40 per cent solution of formaldehyde gas in water and may be obtained at any drug store for 40 cents a pint. One-half ounce of formalin in 1 quart of water makes the proper solution with which to drench the animal."

In urgent cases tapping the paunch with a knife or better with trocar. This is a sharp-pointed veterinary instrument incased in a sheath which leaves the sharp point of the trocar free. The instrument or knife is stuck through the wall of the paunch in the hollow just in front of the hip bone, equally distant from the last rib the hip bone and the transverse processes of the back bone. If a knife is used it may be difficult to keep the cut from closing but where the trocar is used the sheath is left in as long as any gas is escaping.

TEAM WORK BY THE SCHOOL, CHURCH AND HOME

(The betterment of country life is so great a problem that all the agencies at work in that direction should be brought together in one great co-operative effort for that purpose. This excellent article by Oakel Fowler Hall, Purdue University, in a recent number of the Purdue Agriculturist furnishes a strong plea for a close co-operation of the School, the Church and the Home.)

Since the appointment by President Roosevelt in August, 1908, of a Commission on Country Life few subjects have received more thoughtful consideration than the Country Life Movement, which, in the words of Dr. L. H. Bailey, chairman of the Roosevelt Commission, "is the working out of the desire to make rural civilization as effective and satisfying as other civilization." Some of the ablest men in our nation have interested themselves in the movement, and enough books, pamphlets, bulletins and magazine articles have been written on the subject to stagger the most studious.

As this literature and the multitudinous programs of conventions, conferences, and institutes relating to the movement will show, there have been thus far three institutions stressed as outstanding remedial agencies. These three institutions are the School, including institutions of higher learning, the Church and the Home, and each has had its turn in the matter of emphasis. There has been more or less overlapping, to be sure, but broadly speaking, these three basic institutions have been emphasized as channels of rural uplift one at a time.

For the first three years of the movement emphasis was placed upon the School. We were led to believe that education was the unfailing solvent of the rural problem. As a result of this emphasis on education, nearly every state in the union took definite steps toward the improvement of its rural schools. In some states campaigns for consolidation, the gathering of three, four or more district schools into one large centralized school, were carried on with varying success; in many the common school curriculum was altered, and such subjects as scientific agriculture, domestic science, and manual training were given prominent places, nearly all the states added extension departments to their agricultural colleges, and we profited in many ways by this timely emphasis on education for rural America. But this did not solve the "rural problem."
